Indian Industry: Measuring Productivity

Work on productivity measurement in Indian industry has left unaddressed several critical issues of method and the correspondence between theoretical measures and the indicators used. Before issues of interpretation are engaged, these methodological issues need to be clarified and, where possible, the measures recast. 2927

Rukhmabai and Woman's Right to Her Person

In September 1885 an extraordinary judgment was delivered by the Bombay High Court in a suit for restitution of conjugal rights. The verdict rescinding Dadaji Bhikaji's claim to restitution of conjugal rights over his wife, Rukhmabai, snowballed into a lively tussle between the Anglo-Indian press and the native press. While the Anglo-Indian press was exultant at the proven moral superiority of the British legal system, the native press was alarmed at the threat of socio-cultural subversion of Hindu family and society posed by the judgment. Only in the writings of a few reformers do we find a justification of the judgment based on a native discourse of conjugal rights. 2937

Kashmir: Facing the Issues

Now that cynical realism believes it has won some sort of a victory in Kashmir, it is time to talk of some principles - principles pertaining not only to the way the rulers of India have been dealing with Kashmir, but also the way progressive and democratic-minded Indians have been responding to Kashmir and to the problems stemming from the mode of expression of the demand for Kashmiri self-determination. 2916

Investment, Exports and Growth

While the role of investment in promoting growth seems empirically well established, that of openness to trade is still subject to several ifs and buts. Much of the recent theoretical literature on endogenous growth is similarly ambivalent on the impact of trade policy. 2954

Assam: Elusive Peace

The people of Assam had hoped that the political change in Dispur and New Delhi would revive democratic efforts to restore peace through negotiations. But these hopes have been dashed as both the government and the ULFA are back to their old routine, to the delight of the shady politician, the smuggler and an assorted group of antisocials. 2903

Oppressive Nexus

The Bathani massacre in Bhojpur district of central Bihar once again highlights the ongoing suppression of the struggles of the underprivileged by the private armies of the upper castes in alliance with middle caste state apparatus. 2908

On Two Fronts

The condition of the working class and the trade unions under the New Economic Policy takes us back to the pre-independence days when the working class had to fight simultaneously on two fronts: the local capitalists and the foreign imperialist. It is a time for preparing the working class and their organisations, especially those of the organised sector, not for fighting for new economic benefits, but for providing leadership to the great political battle ahead. 2905

Local Government Undone

In Pakistan, democratically elected local governments have been made impotent by democratically elected members of higher provincial and national assemblies. While extensive legislation exists which could permit the effective role of local government in development, the severe financial constraints faced by these governments have meant that they are no longer involved in the process of development. 2948

'Great Game' Renewed

Indian foreign policy always perceives regional issues from the perspective of its rivalry with Pakistan. This is evident in official assessments of recent events in Afghanistan which are obsessed with Pakistan's role in the Taliban victory but silent on the US connivance. To gain credibility in the region, India also needs to take a stand on the human rights issues thrown up by the Afghan situation. 2913

LETTERS TO EDITOR

Denial of Passport to Journalist

M N RAVUNNI's (secretary, central propaganda committee, Communist Party of Kerala (KCP) and chief editor *Munnani-porali*) battle to break the illegal, undeclared ban on his travel reached a crucial stage when the Kerala High Court rejected the passport issuing authority's explanation and sought a detailed reply. Ravunni had applied for his passport in July 1995. Repeated reminders and a lawyer's notice were ignored by the authorities who simply kept saying that they needed more time to 'collect' information about him. In fact, they were using delaying tactics to disrupt his possible travel plans and prepared a dossier on his revolutionary journalist activities. The brief submitted to argue Ravunni's case at the high court pointed out that the government not satisfied with locking up this courageous internationalist fighter for 16 years in the jails was now intent on detaining him within the walls of India. It challenged the government's claims of adhering to the Constitution since it was denying Ravunni freedom of movement granted by Article 21. Apart from stating that Ravunni figures on the all-India and state security lists the government had no reply to these charges. These so-called security lists are notorious for the way they are prepared according to the current whims and fancies of the rulers. They also highlight the real nature of Indian democracy which continues to implement colonial police state rules under a thin veil of legality.

Ravunni has a long record of nearly 40 years of communist activity, despite detention, torture and death threats. He has been in the forefront of solidarity activities with the oppressed in India and abroad. If the Indian state succeeds in imposing a ban on

his movement this would have serious repercussions for the progressive forces and would strengthen the black laws regime being built up by the state in accordance to the needs of its IMF-World Bank advisors. The fact that a person of Ravunni's stature and unstinted record of serving the people is denied his basic right to a passport by the very authorities notorious for their repeated foreign jaunts spending valuable foreign exchange and now on trial for their illegal foreign exchange rackets is an ironic exposure of the true state of affairs in this country.

We appeal to all justice loving, progressive and democratic people to protest against the denial of a passport to Ravunni.

Secularism and Islam

THIS has reference to 'Secularism: Bench-Marked by Hindu Right', by Brenda Cossman and Ratna Kapur (September 21) where they say (p 2625) that the Muslim community in India is a culturally distinctive group. Perhaps it might be worthwhile to dwell on what are the distinctive features which separate them from the Hindus, Christians, Parsis and Jews in this country. Obviously, the main characteristic is their belief in Allah and that Mohammed is the last (and, therefore, the best) prophet, which is the central feature of the religion called Islam. There are many other countries where there are people following Islam - in some they are a majority, and in some a minority. How are these Muslims culturally different from the Muslims in India? After all, if the Muslims in India have a culture based on Islam, then there should not be any difference. If one were to accept this (and I am not sure whether

the Muslims of, say, Iraq will acknowledge that they are culturally similar to the Muslims of, say, Iran, let alone India), then the cultural roots of the Muslim citizens of India are outside the geographical borders. And in these roots then personalities like Lord Ram and Lord Krishna have no role, and it will be people like Babar and Aurangzeb who will be their heroes. This will mean that the slogan, 'Hindu-Muslim Bhai-Bhai', coined by Mahatma Gandhi becomes meaningless.

If Cossman and Kapur have a different interpretation, perhaps they would like to expound the same. In this respect, they may wish to consider what Babasaheb Ambedkar had to say in declining to convert to Christianity and Islam. By joining Islam or Christianity, the depressed classes would 'not only go out of the Hindu religion, but also go out of the Hindu culture...Conversion to Islam or Christianity will denationalise the depressed classes.' (D H Keer, *Dr Ambedkar, Life and Mission* (second edition), pp 278-79, Popular Prakashan, Mumbai, 1962. Cited from *The Times of India*, July 24, 1936. Quoted in 'The Personal Law Question and Hindu Nationalism', by Dieter Conrad in V Dlamia and H von Stietencron (eds), *Representing Hinduism - The Construction of Religious Traditions and National Identity*, Sage, 1995.)

Warner's Entry

THE American conglomerate, Warner, has been given permission to build a network of movie houses in India. Films have been and remain the most important medium of mass communication in India. Introducing foreign control of this medium in India is even more harmful than foreign control of the print media which has always been opposed by the Indian government and press - by the latter in its own economic interest. There is no such economic self-interest operating against Warner's entry. It is not difficult to guess that some quid pro quo in the form of huge bribes that we have become familiar with or media coverage that Rao was totally denied during his US visit - was received by members of the Rao government which took this step to the detriment of the country. This step must be reversed. Time Warner moved to take control of the American TV network, CNN, after the controversy opposing CNN having been allowed round-the-clock use of a Doordarshan channel. That issue has been forgotten in India but CNN's use of the Doordarshan channel continues. Whether or not Rao and his cabal of criminals are tried for that step, that step also must be reversed.

In the FIIs' Thrall

THE prolonged sluggishness in the secondary and primary segments of the capital market has brought up the question of the market's role in the economy. Unfortunately the authorities continue to generate exaggerated expectations from the share market by taking measures which only reinforce various distortions in the functioning of the financial system in general and the capital market in particular. Wittingly or unwittingly, the financial sector reforms have meant a shift from a bank-based financial system to one based on the vagaries of the stock market. The development experiences of Japan, Germany and the east Asian economies on the one hand and the Anglo-Saxon countries on the other suggest that industrial finance provided by banks and financial institutions is more steady and assured than that coming from the capital market. Dependence on the capital market brings with it problems of sharp fluctuations in fund flows acting as real and psychological barriers to industrial investment, stiffening of the cost of capital, compulsion for companies to make high dividend pay-outs preventing sufficient plough-back and uncertainties arising from take-overs and mergers. Large corporate savings, which played an important part in the growth of the east Asian economies, were possible because their manufacturing companies were not at the mercy of stock markets which provided only a small proportion of industrial finance in these countries.

In the Indian case, all the above problems have begun to surface, with a major contribution coming from some of the principal components of financial sector reform—competition for funds among banks, financial institutions and non-banking finance companies (NBFCs), deregulation of the interest rate structure, and freeing of portfolio capital flows. Instead of focusing on strengthening the institutional base of the capital market with a view to curbing speculation, instituting a sound depository system, regulating the number and quality of market intermediaries such as merchant bankers and, above all, revitalising the SEBI, the government has plumped for measures which have further stimulated speculation. Most important has been the emergence of foreign institutional investors (FIIs) as dominant players to a point where the initiative in influencing the market has almost completely slipped out of the hands of the authorities. The market has refused to respond to a series of measures to entice the domestic investor, reducing the authorities, from the finance minister down, to relying on the FIIs to come to the market's rescue. However, the large purchases and sales by the FIIs have caused share prices to zigzag when the authorities have desperately wanted the market to be pushed up.

Given the powerful presence of the FIIs, the share market has seemed to ignore as non-events measures taken by the authorities to revive the ordinary investor's interest in the equity market. In his budget in July the finance minister had raised the 5 per cent limit on investment by an FII in a company to 10 per cent and permitted FIIs to invest in the shares of unlisted companies, but the market went into a tailspin probably because of the introduction of the minimum alternative tax (MAT) on companies. The BSE sensx (1978-79=100) fell from its pre-budget peak of 4,067 on June 18 to 3,281 on August 19, a fall of 19.3 per cent in a two-month period. Becoming panicky, in early September the finance ministry announced tax concessions on investment in mutual funds including the UTI, raised stock-lending limits from Rs 5 lakh to Rs 10 lakh and, more significantly, permitted FIIs operating dedicated debt funds to increase investment in debt instruments from 30 per cent to 100 per cent of their funds (excluding government debt). The government also asked the financial institutions and UTI to step up their stock market activities. But the consequential improvement in share prices was small and short-lived because net FII investments were slack in August and September. The FIIs had substantially larger gross sales as a proportion of their gross purchases during this period, over 55 per cent compared with the usual 25 per cent. Anticipation by the market of disinvestment of PSU shares by the government may have been partly responsible for this. The BSE sensx fell to 3,099-3,130 on the eve of the RBI's busy season credit policy announced on October 19. The RBI's attempt to boost the market by permitting banks to purchase shares and debentures in the secondary market again yielded only a short-lived improvement in share prices, with the BSE sensx moving up to 3,342 on October 23 followed by a sharp fall. And now the upgraded SEBI board has announced a series of institutional measures including allowing the BSE to extend its on-line trading system to other cities irrespective of whether these cities have stock exchanges or not, reducing the minimum application size in primary issues from Rs 5,000 to Rs 2,000 and, above all, giving up vetting of offer documents and instead focusing on inspection of merchant bankers. But these steps too have failed to produce the desired results and the sensx has slipped further to a recent low of 3,069 on November 5, a fall of 273 points or 8 per cent since the post-credit policy peak.

Such incremental measures would have had some effect if retail investors had some influence over the market which is dominated by the 413 FIIs registered with SEBI. So far they have made gross cumulative purchases worth Rs 31,300 crore and gross sales worth Rs 9,704 crore, or a net cumulative

investment of Rs 24,000 crore (\$ 6.96 bn). Apart from their influence on share prices, the FIIs have not been above manipulating the market. The latest to complain has been Videsh Sanchar Nigam (VSNL) which has charged four major FIIs with bear hammering of its stock just prior to its GDR offering. The VSNL's fears are well-founded, its share price having fallen by nearly 30 per cent from Rs 1,327.50 on July 22 to Rs 950 on October 15. If the PSU is unable to float its proposed \$400 mn GDR issue this time, this will be its third abortive attempt to raise resources through GDRs. There had been a similar attempt by some FIIs on the eve of the issue of GDRs by State Bank in October. Of course, the finance ministry is right that the government does not have powers to intervene in the investment decisions of foreign portfolio investors and that there is no law prohibiting FIIs from selling shares prior to a disinvestment operation or a Euro-issue. It could be argued that these are normal profit-taking exercises and the only investigation could be into possible short-selling of the particular shares. Even so, the fact remains that on many occasions PSU share disinvestment and GDR issues have suffered on account of the operations of FIIs.

This raises the basic question of the wisdom of the decision taken in 1992 to permit the FIIs to make portfolio investment in the Indian capital market under a highly favourable tax dispensation: 10 per cent on long-term capital gains, 30 per cent on short-term capital gains and 20 per cent on dividend and interest income. The volatility of such portfolio investment is well known. Total portfolio equity flows to developing countries, which were between \$ 4 bn and \$ 14 bn from 1990 to 1992, shot up to \$ 45.6 bn in 1993 and \$ 34.9 bn in 1994 but again slipped to \$ 22 billion in 1995 because of the fluctuating interest rates in the developed countries. In India's case, when the market was opened up in 1992, the FIIs were lukewarm because the price-earning (P/E) ratios were considered high at 35 to 40. But though P/E ratios rose further to 45 to 50, there was a sudden spurt in FII investments during January to October 1994 because the investment climate in the western countries had turned adverse. With the Mexican crisis and the reluctance of portfolio investors to commit themselves in the emerging markets, 1995 saw a sharp reduction in their investments in India. There has been some revival of interest in 1996 after profit-taking towards the end of 1995. With a stock of nearly \$ 7 bn (Rs 24,000 crore) in net investment, the purchases and sales of FIIs are bound to significantly determine the behaviour of the market. In the current calendar year up to October 25, gross

purchases of FIIs have aggregated Rs 13,620 crore and gross sales Rs 3,815 crore. These are bulk transactions, mostly concentrated in blue chips, with enormous influence over market trends. The government has begun to find out that its own measures have little enduring effect on the market.

At the macro level, the cost of FII funds to the domestic economy is high, anywhere between 18 per cent and 20 per cent per annum in rupee terms. Thus on gross investments of about Rs 31,000 crore, the FIIs would have so far appropriated, as a crude measure, about Rs 12,400 crore over a period of two years or so. FIIs take into account dollar yields of about 4 per cent to 6 per cent and inflation differentials of about 8 to 10 per cent and some risk premium. Almost all FIIs come to India through the Mauritius route for tax purposes and pay minimum taxes in India. Against this background, the government needs to reconsider the role of FII investment. No doubt the financing needs of the infrastructure sector are sizeable, but GDR issues by the existing Indian companies may be a more worthwhile alternative as also raising resources through the newly set up Infrastructural Development Finance Company (IDFC).

THE ECONOMY

In the Name of the Poor

THE two nominees of the CPI in the union cabinet, though holding major portfolios, have had to face public discomfiture on more occasions than one when it has become apparent that major decisions of the government have gone against the known positions of their party. The former party general secretary, Indrajit Gupta, has had to wriggle out of difficult situations of this kind by plainly confessing that in regard to this or that decision of the government he had been kept in the dark, notwithstanding that he actually happens to be the home minister in the United Front government.

The recent visit to this country of the president of the World Bank, James D Wolfensohn, however, at last provided an opportunity for the communists in the government to come into their own and to be seen to be asserting themselves. Wolfensohn and his team called on Chaturanan Mishra, the prominent CPI leader and currently the union agriculture minister, and pressed upon him the well known World Bank package of policies, including removal of restrictions on trade in agricultural commodities, especially on their export, and an end to government subsidies in different forms to the farm sector. The next day's newspapers carried prominent reports of how the

agriculture minister had stood firm in the face of the World Bank's demands. In particular it was mentioned that Chaturanan Mishra had told the World Bank president that there was no question of doing away with the agricultural subsidies so long as 80 per cent of the country's farmers were small and marginal.

On the face of things it may seem that Chaturanan Mishra showed just the kind of spunk that Indian policy-makers should be giving more evidence of, in the face of the stereotyped free market shibboleths of the IMF/World Bank combine. A little consideration would however show the matter to be not quite so simple. •

In fact Chaturanan Mishra's statement is just the kind of pronouncement which leaders of the government and of political parties have regularly made through the entire period when a socialist pattern of society was supposedly being created and the economy was moving from one Five-Year Plan to the next and the one after that. These pronouncements were expected to be taken on trust and, what is more, they have been, not by the poor perhaps but certainly by those who are supposed to concern themselves with such matters. This was not accidental by any means, not if the shopsoiled cliché about pursuit of class interests has any truth attached to it. For, in the process a whole range of arrangements have been created and carefully closeted against any sort of probing and questioning in the name of the poor but actually for the benefit of the relatively well-off.

Take the case of the union agriculture minister telling the World Bank president off on the subject of abolition of agricultural subsidies. What, come to think of it, is the connection between the extant subsidies to agriculture and small and marginal farmers? The subsidies that the World Bank president was asking the government to review and which the agriculture minister was defending are those extended to farmers using agricultural inputs, mainly power, fertilisers and irrigation water. What proportion of the consumption of these inputs is accounted for by small and marginal farmers and what part of the considerable amounts spent by the government on subsidising their use goes to benefit this section of farmers? Should not some hard evidence on this matter be made available instead of it being taken to be self-evident that all interference with the present scheme of agricultural subsidies – put in place by successive governments at the centre and in the states about whose concern for the poor the communist minister of agriculture does, or at any rate should, entertain grave reservations – would be to throw small and marginal farmers to the wolves?

The market, to be sure, is not the most just, and quite often not even the most efficient, allocator of resources among alternative purposes. But for that reason the task of apportioning resources among different uses and different groups of beneficiaries does not cease to exist and those in the government who claim to speak for the poor cannot evade facing the question whether the really poor would not be enormously benefited if large sums were to be saved out of what has been doled out year after year by the central and state governments in the name of agricultural subsidies and were to be made available to be spent instead, to mention just one of so many possibilities, on a programme of compulsory primary education in the rural areas. This may not be what the World Bank and the IMF have in mind when they ask for the withdrawal of subsidies, but surely there can be no harm if the communist members of the ruling United Front, those in the government and those outside, turn their thoughts to such matters once in a while.

THE PRESS

Different Threats

A correspondent writes:

WHEN the whole national and regional press was up in arms against what appears to have been a provoked attack by the Bahujan Samaj Party leader, Kanshi Ram, on media persons in New Delhi, a far more insidious way of muzzling the press was being tried out in Mumbai. *Aaj Dinank*, a successful Marathi evening paper, had to abruptly stop publication on October 16 under the none-too-hidden directives of Shiv Sena bigwigs.

Aaj Dinank, which had been coming out for three and a half years, was jointly owned by Kapil Patil, the editor of the tabloid, Lalsingh Rathod and Bhupesh Patel. Lalsingh Rathod, who is a member of the Maharashtra legislative council, was elected as an independent with the backing of the Shiv Sena and the Progressive Democratic Front. Bhupesh Patel is the brother of Mukesh Patel who is a Shiv Sena MP in the Rajya Sabha and the owner of the Autoriders group of companies. While Patil and Rathod each had a 30 per cent share in the company bringing out the tabloid, Bhupesh Patel owned the remaining 40 per cent. When the daily was launched in 1993, neither Rathod nor Mukesh Patel apparently had any links with the Shiv Sena. In fact, Rathod was then an MLC with Congress support while Mukesh Patel was confined to his business.

Right from the beginning the evening paper had been critical of the Shiv Sena. In fact, its office had become the target of the Sena's

attack in 1993 when it leaked the news that Dattaji Salvi, leader of Bharatiya Kamgar Sena, was to be removed on the instructions of the Shiv Sena chief. Kapil Patil, the editor, has been in the forefront of organising the OBCs in the state since 1978. He is one of the founders of the recently established all-India Muslim-OBC organisation. As part of this initiative, he was close to Chhagan Bhujbal who had launched the Samata Parishad to gather the OBCs under the Congress banner after his break with the Shiv Sena. Though there was no interference in the editorial policy from the other two partners, the line pursued by the paper became a cause of anxiety to them, especially after they moved closer to the Sena. The evening paper was also the first in the Marathi press to publish an editorial on the Ramesh Kini episode. The editorial had also drawn attention to the systematic uprooting of Marathi-speaking people from south and central Mumbai because of the Shiv Sena's connivance with wealthy commercial interests and had challenged the Sena's claim to represent the sons of the soil.

What proved to be the immediate cause of the closing down of the daily was a report carried by it on October 15 that the brain of Ramesh Kini was missing during the second post-mortem. The Sena high command, which has become very sensitive to the issue after the implication of Raj Thackeray in Ramesh Kini's death, immediately put pressure on Rathod and Mukesh Patel to instruct the editor to adopt a 'soft line' and if he did not do so to sack him. It was even suggested that a new editor be brought in to keep the evening paper running. But since Patil was part owner of the venture, it was not possible for the partners to 'sack' him. With Patil refusing to take a 'soft line', the paper had to be closed down to achieve the Sena's objective.

Superficially, the closing down of *Aaj Dinank* can be made to look as if it was the result of differences between the editor and the owners of the newspaper. But the circumstances in which the closure came about make it obvious that the matter was not so simple. Organisations such as the Shiv Sena have many different ways of suppressing

APPOINTMENTS

INSTITUTE OF ECONOMIC GROWTH

UNIVERSITY ENCLAVE
DELHI - 110007

APPLICATIONS are invited for the post of Professor in the Population Research Centre of the Institute in the scale of Rs. 4500-7300.

Essential Qualifications: The applicant should be an eminent scholar with an outstanding academic and publication record. He/she should have published books and papers of high quality in economics, demography, or sociology, and at least 10 years experience in research and teaching, including in guiding doctoral students. Preference will be given to persons with demonstrated research interests in one or more of the following areas: population, human resource development, health and family welfare, gender and development, urbanisation, and historical and comparative demography. Knowledge of survey techniques and quantitative analysis is desirable.

It will be open to the Institute to consider names of suitable candidates in absentia. The Institute also reserves the right not to fill the position, if circumstances so warrant.

Applications with a CV, attested copies of university degrees, and copies of two published papers, should reach the Director within six weeks from the date of publication of this advertisement.

DIRECTOR

free speech. The Press Council has launched an enquiry into the incident involving Kanshi Ram and the newsmen. It may be no less worth the Council's while to look into the disappearance of the Mumbai evening.

NICARAGUA

A Different Path

THE Sandinista leader Daniel Ortega's defeat in Nicaragua's presidential election, though currently under some dispute, is not so much a vote of confidence in the conservative Liberal Alliance, but a vote of lack of confidence in the Sandinistas and their ability to pull the country out of the mess that it is in today. Since 1990 when the Sandinistas lost power, the economy has deteriorated and has become severely debt-bound, with the most visible signs being the worsening health indices, rising unemployment and growing number of loss-making landholdings, etc.

Though the details of the voting pattern in the presidential election are not available, reports indicate that the Sandinista leader got less than 40 per cent of the votes against the conservative Arnoldo Aleman. (Under the Nicaraguan system, the winner needs at least 45 per cent votes to avoid a second round.) While on the one hand, this only means a continuation of the US-led policies of Violetta Chomorro, for the Sandinistas it is a big setback. In the six years that they have been out of power – Daniel Ortega and the Sandinistas had lost to Chomorro in an election called by the then Sandinista government – the Sandinistas have not been able to establish a consistent people-backed movement against the Liberal Alliance in power. There have been many reasons for this. In the first place, even in 1990, the Nicaraguan economy was reeling under the heavy cost of a long war with against the US-backed Contras. The Sandinistas' agrarian reform, the core of their transformation programme, as Ortega himself admitted in an interview in 1994 to the *Multinational Monitor*, had become something of a millstone around their neck; their health services, radically different from that in any other socialist country, which had contributed so tremendously to the improvement of the health situation in the country, were beginning to crumble under the onslaught of the US-Contra strategy of hitting 'soft' targets and breaking the "social expression of the revolution"; and most of all, the Nicaraguan economy was tottering under the pressure of embargoes, the lack of capital and a shrinking industrial base, especially after aid from the socialist countries began to dry up. Some sections of the Sandinistas had then argued that the time

was not ripe for the sort of democratisation undertaken by Ortega. The Sandinista strategy after they lost power was to hold on to some rungs of the government and its agencies, to ensure that as many of the Sandinistas' programmes as possible were continued.

What appears to have happened, however, is that the Sandinistas have not been able to make their presence felt in the areas where they chose to be active in. Instead, they have come to be seen by the people, with ample help of course from the right-backed media and the government, as obstructing the functioning of the government and sabotaging the forces of change. Even with regard to the presidential election, ironically enough, the fact that the Sandinistas held several important positions in the election commission had led to speculation that the election process may be rigged in favour of the Sandinistas. The election commission is responsible for registering voters, distributing ballot papers to the various centres and so on, and there were suspicions about whether the Sandinistas might not, simply by dragging their feet, ensure that the rural areas where Aleman had support were not well serviced. As it happened there was large-scale confusion about the distribution of election services in large areas, but this was actually due to unexpected inclement weather. However, it would be a difficult task to unravel just how free and fair the elections were, because unlike the last elections this one had few neutral observers overseeing the process.

In a sense the Sandinistas do not have a weighty enough legacy to fall back on and the strategies they chose to adopt while 'participating' in democratic government have led them away from organisational and political work among the people. In the last six years almost the only visible opposition action was the protest by university students over the diminishing funds for the universities. The students held a foreign delegation hostage for a short while but were forced to release the hostages without any promises. In many ways it was a futile action given that the Chomorro government was hardly in a position to release larger funds to the universities when even primary funding for education was being cut. It is not of course that all is lost – there is a genuine grass roots support base for the Sandinistas and the social and economic policies that they had attempted to establish. A recent international solidarity meeting drew notable support not only from groups abroad but from the people. But there is need for greater political mobilisation and the Sandinistas have to learn to cope effectively with the different parameters of fighting for liberation within a parliamentary democracy.

TWENTY YEARS AGO

EPW, November 6, 1976

Addressing a press conference in Bombay on October 29, Sanjay Gandhi expressed the view that elections should be put off till the country's economy was stabilised. The next day, on October 30, the Union law minister announced in the Lok Sabha the government's decision to postpone elections and to extend the life of the Lok Sabha by one more year, till March 1978. The normal term of the present Lok Sabha expired in March this year and had already been once extended by one year.

Despite the nearly year-and-a-half long State of Emergency and all that it has meant, there was some expectation that elections might be held early next year. This expectation was based on the calculation that thanks to another good monsoon, the economic situation was still favourable from the ruling party's point of view; at the same time, the opposition parties were still scattered and disorganised. There were, therefore, reasons for the Congress to confidently expect to do well in elections, especially considering all the other advantages that it enjoys in the present situation. Another persuasive argument for having the elections soon from the Congress Party's point of view was that the first of the two favourable factors mentioned above might not hold good for much longer.

These calculations, however, ignored one relevant consideration, viz. that while this might be an opportune time to have elections from the standpoint of the Congress Party as a whole, elections at this stage may not suit the convenience of all sections of the party uniformly... The newly emerging forces in the Congress need more time to consolidate their position within the party, especially to gain from footholds in the countryside which continues to be controlled by the established leadership. The latter while paying lip-service to the new emerging forces, has taken care to keep its power bases as intact as possible. On the whole, elections at this stage would have enabled the established leadership to come out of the shell into which it has had to withdraw in the last year-and-a-half and to reassert itself via the selection of party candidates, the mobilising of the party's traditional vote-banks and the rest of the paraphernalia of elections...

Another very relevant consideration is that in the next few months the Constitution may undergo further drastic change. It is well known that there is an influential section in the Congress which holds that the 44th Constitution Amendment Bill has not gone far enough... The movement for further amending the Constitution may well gather momentum as early as at the Gauhati AICC Session later this month. And what is more, next time the amendments may not stop with enlarging the powers of the executive, as the 44th amendment has done, but may basically alter the character of the executive, its relationship with the legislature and even the manner of its election. It is entirely on the cards, therefore, that the next elections, when they are held, will be altogether a different kettle of fish from the five general elections we have had in the past.

CURRENT STATISTICS

EPW Research Foundation

The sources of monetary growth have begun to show some queer trends. The acceleration of monetary growth has been accompanied by slower growth in domestic credit and sizeable increase in foreign exchange accruals. The centre's monetised deficit and the use of *ad hoc*s have come down considerably but they have been replaced by other banks' credit to government. Bank credit to the commercial sector has also been very low, suggesting a surfeit of liquidity. These developments are reflected in a decline in short-term interest rates, including yield rates on government paper, and in the annualised forward premia for the US dollar.

RF means Reporting Friday for fortnightly reporting of conditions of banking business and the fortnight serves as the reserve maintenance period for scheduled commercial banks. @ Based on daily quotations supplied by Meckl Financial and Commercial Services Ltd, Mumbai.

Notes: (i) Superscript numeral denotes month to which figure relates, e.g. superscript 4 stands for April. (ii) Figures in brackets are percentage variations over the period specified or over the comparable period of the previous year.

GSFC

Best Ever Performance

A MAJOR player in the fertiliser industry, Gujarat State Fertilisers Company (GSFC) manufactures fertilisers, petrochemicals, chemicals and industrial products. While fertilisers (mainly phosphatic) contribute 58 per cent of total revenue, petrochemicals (especially caprolactam) contribute 30 per cent and industrial products account for the balance. With the decontrol of phosphatic and potassic fertilisers earlier, all the fertilisers manufactured by the company (except for urea) are out of price control. The Gujarat government holds a 42.2 per cent stake in this diversified company.

The company has come a long way since its inception in 1962 and 1995-96 has been its best year since in terms of turnover, production and profitability. After seeing a lacklustre performance in the previous two years, the company has notched a sharp 79.9 per cent rise in net profit on a 13.7 per cent rise in net sales in 1995-96. Taking into account the fact that last year's net profit of Rs 114.4 crore contained a major chunk (Rs 65 crore) of non-operating profit, the company's performance in 1995-96 is even more impressive. Better realisations from the sale of caprolactam and a tight leash on costs led to a rise in the operating profit margin from 16.4 per cent in 1994-95 to 23.9 per cent in 1995-96 and the net profit margin from 7.7 per cent to 12.2 per cent.

The company's plants are located in Fertilisernagar (Vadodara), Nandesari (Vadodara), Moti Khavdi (Jamnagar) and Kuwarda (Surat). Production of fertilisers touched a new high at 14.98 lakh tonnes as against 13.97 lakh tonnes in the previous year, mainly due to the company's diammonium phosphate (DAP) plant which operated at an average capacity of 180 per cent producing 5.85 lakh tonnes of DAP (1994-95: 5.3 lakh tonnes). The production of caprolactam was also higher at 65,651 tonnes against 54,037 tonnes in the previous year while that of nylon filament yarn increased from 5,552 tonnes to 6,824 tonnes over the same period.

Despite the encouraging performance of the company, a few disturbing trends can be noticed, the first being the sharp rise in imports of 78.7 per cent over the previous year, more so, when one takes into account that imports equalled 52.7 per cent of net sales (1994-95: 33.5 per cent) and the import content in raw material consumed increased from 73.1 per cent to 81.7 per cent. While phosphoric acid accounts for 43.7 per cent of total raw material consumed by the company, benzene accounts for 11.4 per cent and ammonia accounts for another 12.5 per cent. The other major raw materials consumed by the company include acetone,

monomer rock phosphate, sulphur, naphtha and ammonia. Exports, on the other hand, were negligible at 4.5 per cent of net sales. Another disturbing feature is the build-up of inventory (up 37.3 per cent) and debtors (up 24.8 per cent) over the same period.

With the setting up of its own co-generation plant, the company has protected itself from one of the major problems faced by most fertiliser companies, i.e., power shortage. GSFC is the sole domestic manufacturer of melamine which is used in laminates, paints, chemicals and crockery and caters to approximately 40 per cent of the total demand in the country. In April 1995, the company was forced to cut melamine prices from Rs 52,000 per tonne to Rs 40,000 per tonne to compete with the landed cost of imported material. The user industries still preferred to import melamine through the advance licensing route. With the change in the licensing scheme to a quantity based one, importers now prefer to import other raw material under this scheme. Consequently, the company was once again able to raise prices to around Rs 72,000 per tonne. Further, the company is increasing its capacity from 5000 tonnes to 15,000 tonnes and the additional capacity is expected to go on stream by December 1996/January 1997. The 1,350 tonnes per day ammonia expansion project is also on schedule and is expected to be completed in the third quarter of 1997.

For the first five months of the current year (1996-97), all fertiliser plants of the company have been operating above installed capacity and turnover has touched Rs 697 crore – a rise of 15.8 per cent over the corresponding period last year. This despite a fall of 12.6 per cent in overall phosphatic fertiliser production in the country, during the first four months of 1996-97. Sale of caprolactam during the same period was higher by 24 per cent at 22,774 tonnes. Notwithstanding the company's promising performance, its stock is languishing at Rs 81, discounting its 1995-96 earnings per share (EPS) by a mere 2.6 times. Incidentally, the company's EPS jumped from Rs 17.2 in 1994-95 to Rs 31 in 1995-96 and its book value surged to Rs 143 (1994-95: Rs 116).

RANBAXY LABORATORIES

Farsighted Planning

The largest pharmaceutical company in the country, Ranbaxy Laboratories, has posted a 25.3 per cent increase in net sales for 1995-96. Despite increase in manufacturing and other expenses, the company has managed a 27.6 per cent increase in net profit by keeping tabs on interest costs (down 7.5 per cent). The lower increase in tax provision (up 9.4 per cent) has also benefited its bottomline.

A major part of the company's revenue is presently drawn from the manufacture of

generic drugs in both final formulations and bulk form. In addition, the company also manufactures animal healthcare products, diagnostics and laboratory chemicals.

The company's thrust on exports has resulted in its products being available in over 40 international markets. Exports account for 47.9 per cent of net sales and have increased by 34.8 per cent from Rs 296 crore in 1994-95 to Rs 399 crore in 1995-96.

The consistent good performance of the company and its leadership position in the domestic market can be attributed to several factors like well-established brands, strong R and D base, wide distribution market and its strategic global alliance agreements with Eli Lilly of US. R and D expenses increased by 37.6 per cent during the year and, as a percentage of net sales, rose from 3.1 per cent last year to 3.4 per cent. The company's large investments in this area over the years (Rs 28.7 crore in 1995-96) have been channelled towards process development/upgradation for bulk drugs, key intermediates, conventional and novel drug delivery systems, fermentation and biotechnology based products complying with international quality and regulatory norms. The company has promoted Solus Pharmaceuticals for consolidating and expanding its market share of branded dosage forms in the domestic market. The company also plans to maintain its thrust on exports as is evident from its policy of setting up joint ventures in different countries all over the world like Ranbaxy Genpharm (Canada), Ranbaxy (Hong Kong), Ranbaxy (China), Eli Lilly Ranbaxy (India), etc. With a view to focusing on drugs coming off patents in the next decade, the company has acquired Rima Pharmaceuticals (a small Irish generic dosage manufacturer) and Ohm Laboratories of the US. In the domestic market as well, Ranbaxy plans to acquire a 30 per cent stake in the Hyderabad-based Vorin Laboratories through its wholly-owned subsidiary, Vidut Investments.

The company's earnings per share has increased from Rs 25.6 last year to Rs 31.7 while its book value has jumped from Rs 149 to Rs 183 over the same period. The company's strong fundamentals seem to be well recognised on the stock market with its share price quoting at around Rs 610 – 19.3 times its 1995-96 earnings per share compared to the average price-to-earnings multiple of around 14 for large Indian pharmaceutical companies.

FINOLEX CABLES

New Joint Ventures

Notwithstanding the increased competition, Finolex Cables, one of the largest players in the jelly-filled telephone cable industry,

has notched a 29 per cent increase in operating profit in 1995-96. The company's raw material costs have increased significantly and imports accounted for 70 per cent of its raw material requirements. Consequently, while net sales improved by 25.2 per cent, the growth in net profit was proportionately lower at 10.9 per cent over the previous year. The higher interest (up 50 per cent), depreciation (up 35.7 per cent) and tax provision (up 30.3 per cent) also led to the lower rise in the company's bottomline.

The company has two plants in Pune, one at Urse which concentrates on the production of jelly-filled telephone cables, and the other at Pimpri which manufactures light duty cables comprising mainly of electrical wires, industrial flexibles, automobile cables and winding wires for submersible pumps. During the year under review, production of jelly-filled telephone cables, which accounted for up to 60 per cent of the company's revenue, increased by 18.5 per cent from 2,950 thousand cubic kilometres (tckm) to 3,495 tckm. With a view to catering to the growing demand, the company had increased its installed capacities for jelly-filled telephone cables from 5,500 tckm to 6,500 tckm and for light duty electrical cables from 520 tckm to 600 tckm.

With the significant growth expected in the power, automobile, construction and other industrial sectors, the company now plans to shift its focus to light duty electrical cables, power cables and communication cables developed in-house. However, jelly-filled telephone cables will continue to provide higher sales volumes. The company has recently launched a low-smoke building cable called Flameguard for the first time in the country to cater to the booming housing industry.

The company's backward integration project for the manufacture of continuous cast copper rods and related downstream copper wire products in collaboration with Essex Group of US is expected to go on stream by March 1997. Finorex Sheets, the company's joint venture in collaboration with Paltough of Israel for the manufacture of PVC rigid sheets, is in an advanced stage of completion. With fibre optic cables threatening to replace jelly-filled telephone cables due to their superior technology, Finolex Cables has decided to enter this field with a joint venture, AT&T Finolex Fibre Optic Cables; the venture is being set up in collaboration with AT&T at Urse in Pune.

The company's book value has increased to a phenomenal Rs 247. Earlier bonus issues by the company were in the years 1987-88 (4:5), 1992-93 (1:1) and 1994-95 (1:1) when its book value stood at Rs 105, Rs 128 and Rs 222, respectively. Currently quoting at Rs 173 on the Bombay Stock Exchange, the scrip is discounted at 5.7 times the 1995-96 earnings.

ASSAM

Hopes of Peace Dashed

Business as Usual despite Political Change

Hiren Gohain

The people of Assam had hoped that the change of governments in Dispur and New Delhi would revive democratic efforts to restore peace through negotiations. But these hopes have been dashed as both the government and ULFA are back to their old routine, to the delight of the shady politician, the smuggler and an assorted group of antisocials.

THE present stalemate in Assam, with both the ULFA and the government of India displaying a marked reluctance to accept a negotiated settlement of the grievances of the extremists, is causing great damage to the economy of the state, ruining prospects of its economic development and plunging the common people into misery and gloom. The government of India balks at a political initiative to solve the problem of militant secessionism in a state considered by many a key link in any strategy for the future of the north-eastern region. Its latest plea for inaction is that the ULFA has turned into a puppet of the ISI and has lost the power of independent decision.

If the ISI is really providing ULFA with arms and materials, as it once did in the case of the Afghan mujahideen, there seems little sense in the ULFA's campaign for large-scale extortions. So far no credible evidence of this alleged ISI control has been produced by the Indian authorities. Indeed, not so long ago the then GOC-in-C of the armed forces in the north-east flatly stated that he had come across no such evidence. Neither the officials of the home department nor the present spokesmen of the army have brought to light any documentary or material evidence in support of their claim. That does not prevent them from issuing statements to the effect that the ISI is training ULFA recruits in camps in Bangladesh in the use of firearms and methods of guerrilla fighting.

Now that Pakistani influence on the government of Bangladesh is on the wane following Sheikh Hasina's election as prime minister, the ISI is unlikely to enjoy the favour of that government. Yet the ULFA seems as adamant in its line of thinking as ever. According to reports emanating from army sources they have now shifted their camps to Bhutan, where the Indian army dare not interfere for fear of an international scandal. No one has said so far that Bhutan

too is under ISI influence and, of course, none has the nerve to say that these camps are under the control of RAW!

The ULFA leadership seems equally determined to evade any opportunity for realising their goals through discussions. While popular support for their demand for independence is at best lukewarm, they urge the people to make grimmer sacrifices. Their plea is that they have nothing to negotiate about if it is not complete independence for Assam. They point out with some justice that the earlier talks held in 1990-91 did not discuss secession and independence, with the result that they led to a sell-out by a renegade section of the leadership, as well as creation of the dreaded SULFA, who became the private army of the corrupt Congress(I) leaders. But realising the deep yearning for peace among the common Assamese, they respond by hedging the idea of talks with impossible conditions like holding talks in a third country.

The people of Assam hoped that the change in government both in Dispur and Delhi would renew a democratic approach to politics and help restore normalcy through negotiations. But those hopes were dashed as both the sides resumed their old routine, to the delight of the shady politician, the smuggler, and an assorted group of anti-socials.

EXTORTION BY ULFA

The ULFA has reportedly raised this year Rs 26 crore in Guwahati and Rs 36 crore in the Tinsukia district in the tea garden belt through extortion and terror. Their favourite targets in this campaign are tea gardens, big wholesale merchants from outside the state, the new-rich professional elite, and the corrupt officials. The tea gardens are supposed to sell in local markets 30 per cent of their products at 'reasonable' rates. They never do. Tea prices in Assam are as high

as in Delhi and Mumbai. The gardens cook their accounts to evade taxes and encroach on thousands of acres of prime land while there are hordes of landless flood-hit families staying in relief camps. They deny decent wages to their labourers (at present Rs 25 per day, with inadequate rations supplementing them), who also receive no wages for Sundays. The wholesale merchants in collusion with the powerful outsider truck-lobby take advantage of the fact that 80 per cent of the groceries and other consumer goods consumed in the state have to be imported from other states and jack up prices at will, create artificial scarcities and sell sub-standard goods to captive markets, making vast profits. The price level is at least 50 per cent above that of other states. Incidentally, this is the only state where the railway route linking it with other parts of the country has no double track and trains start and arrive five to 24 hours behind schedule. Corrupt officials and contractors have drained the state treasury in the last 10 years of at least Rs 1,000 crore through spurious LOCs and false bills. The CBI seems hesitant to pursue leads as these might expose 'useful' political leaders. Doctors, lawyers and other professionals skim the cream of such fabulous earnings and occasional raids have found lakhs of rupees in cash stacked in their Godrej lockers and almirahs.

The ULFA targets these three or four affluent categories. Extortion seems to be their main activity. The ideological and political implications of which activity for their articulate urban supporters are hardly very reassuring. Kidnapped persons belonging to such categories, if they return alive, vehemently deny having paid huge ransoms and with drawn and haggard features go on to sing praises of the selfless patriotism and polite manners of their abductors. Resistance means a quick death under a hail of bullets as a rich merchant only recently found out at a place called Kharupetia.

DEMORALISED POLICE

The police are still demoralised by their justified apprehensions that since both the AGP and the ULFA stem from the same Assam movement and the AGP too has raised a demand for 'self-determination', it might not be safe to go after the ULFA. A hardworking and efficient DIG of the police; Subir Kumar Deb, was recently ambushed near his home for taking a tough line. Armed with vintage World War II weapons and accustomed to supplementing their meagre income with diligent extra-legal pickings, the police force of the state has been unnerved

by the explosion of ethnic violence and extremist militancy. The presence of numerous companies of CRPF and the drastic usurpation of their patch of ground by the army under the barbarous Armed Forces (Special Powers) Act, 1958 have induced in them a certain inferiority complex and passivity. Marginalised by the CRPF and the army as far as big operations go, they seem content to keep order in public rallies addressed by ministers and manning sentry posts in check-gates and VIP residences.

The army, having learnt from the failure of the first anti-terrorist campaign of 1990-91, has managed to recruit large numbers of local informers of the lumpen variety. These informers sometimes have their own personal scores settled by the army by planting false information. The villagers dare not refuse shelter to heavily armed militants, particularly as police help is likely to be tardy and inadequate. The Armed Forces (Special Powers) Act, as interpreted by the Supreme Court, provides that when the army starts an anti-terrorist operation, the local administration and the police are to work in tandem with it. When the army nabs a terrorist it is supposed to hand over the captive immediately to the police. This does not happen often. In fact the general secretary of the ULFA pointed out on October 24 that one 'Biplab Gohain' taken into custody by the army had not been produced before civil authorities in defiance of the order of the Guwahati High Court. The Act provides that even a non-commissioned officer of the army can fire upon and even kill any person who disobeys an order during an operation. The jawans can enter any house and search it and arrest anybody without warrant if 'public order' requires it. And public order usually obliges.

ARMY ATROCITIES

During the Congress(I) regime, army atrocities were regarded as the greatest outrages of that government by the people of Assam. The horror of an army attack on a totally innocent wedding procession, killing two veterinary students from Sikkim and a local veterinary surgeon, in a place called Deepila Chowk, an incident where even a government enquiry squarely blamed the army, still remains an unhealed scar in the memory of the people. The Congress(I) ministry was held guilty of complicity in all such incidents and now that a regional party is in power people expected an end to such horrors. To the dismay of even staunch AGP supporters there is no sign of any let-up in such barbarities. To be sure, the ULFA also seems scornful of all laws maintained by the hated 'Indian state' and it obviously regarded the generous early gestures of the AGP government as marks of weakness or softness towards its line. A fusillade of ambushes,

firings and kidnappings abruptly ended the bonhomie between the AGP and the ULFA. But the police lacked the will to take on the ULFA and the army was left in absolute control of anti-terrorist operations. The GOC-in-C of the armed forces in the north-east recently expressed unhappiness that while the army is required to use 'maximum force' against the enemy, in dealing with insurgency they are handicapped by their inability to use maximum force. Since both the central and the state governments have ceased to take an active interest in starting a dialogue with the militants, the army is being pushed to the very edge of 'maximum force.' In any case many jawans fail to see the fine distinction between maximum and reasonable force.

Every day local newspapers scream details of torture, molestation, destruction of property and even rape. Some of those reports are exaggerated, but there is no doubt that there have been atrocities. Interrogation in army camps has often led to permanent physical injury, even death, of suspects. No compensation is given to survivors. The high court does provide some much-needed relief to extremists and suspected terrorists, but the dilatory process of law and the law courts' constitutional limitations leave room for gross excesses.

On October 12 the army is alleged to have killed in fake encounters two youth, Dibakar

Bora and Golok Saikia, in Jamuguri village of the Sivasagar district. Earlier, on September 24, the army arrested five youth who had reportedly enjoyed a feast together in celebration of a victory in a local football match in the Talap-Megela village of the Tinisukia district and had been fast asleep when the army swooped down upon them on some information provided by a tout. Two of them, Torun Sonowal and Osman Ali, died following night-long torture and the rest were rushed to hospital in a critical condition. Press reporters found Proshanto Goswami, suspected ULFA, detainee, in uncontrollable shivers after three days of torture in an army camp. Matoram Sarma of Morigaon was tortured in an army camp on October 18 by interrogators administering intermittent electric shocks until he was prostrate with agony and exhaustion.

Such activities are bound to give the jawans an illusion of being above the law. They reportedly plunder money and other valuables from households of suspects and misbehave with women. On October 22 a CRPF jawan in civil dress tried to molest a girl visiting a mela on the occasion of the Durga Puja near the Dumuni tea estate. The incensed menfolk of the tea garden surrounded the CRPF camp and attacked it. Obviously it was not the first incident of this kind. The CRPF opened fire to control the mob, killing three labourers of the tea garden.

To outraged protests from citizens the state government replies that it is the central government which is the ultimate authority and which does not want to withdraw the army. On the other hand, home minister Indrajit Gupta has assured a delegation of a youth organisation from the state, the AJYCP, that the centre is most unwilling to deploy the army in the Assam countryside and that it is being done under pressure from the state government. Reportedly he even urged the AJYCP to organise protest movements against the deployment of the army in the state against terrorists. This murky situation is made even more intriguing by the prime minister's applause of the army's role in the state during his recent visit. One suspects that between them the state and the central government are not only passing the huck to each other, but also diabolically hoodwinking the people about their real intentions.

This undeclared but protracted war by a government against its own people whom it 'represents' not only induces a dangerous irresponsibility among the security forces and the army, an irresponsibility that the law cannot check nor public opinion restrain, but further encourages and supports rapid erosion of respect for law and constituted authority at all levels of society. The ULFA must share the blame for such a state of affairs with its inhuman interpretation of patriotism and identity. Human rights bodies supported by the ULFA from behind the scene are sectarian organisations that keep out democratic elements of society who do not share the ULFA's aims. Hence their failure to mobilise wide popular support for any movement against army atrocities.

The insurgency in the north-east is a symptom of a deep malaise in the Indian state with its monolithic and authoritarian features. It is totally out of step with fast developing ground realities and its habitual response to situations it cannot understand and control has been violence. Politicians are tolerated only if they compromise with this violence. There is even a possibility that academics and political scientists who question this violence without endorsing extremism may be one day subjected to 'maximum force'.

READY-MADE SOLUTIONS

During his recent week-long visit to the north-east in the third week of October, there was plenty of evidence that the prime minister was content to remain within the ambit of policy and point of view jointly framed by powerful bureaucrats in New Delhi and local politicians with vested interests. Those policies and programmes were based on the assumption that the various tensions in the

north-east were primarily a challenge and danger to the behemoth of the centralised Indian state. That is why in Manipur numerous popular democratic organisations including women's groups were denied an opportunity to meet the prime minister, which led to a massive "people's curfew" and total boycott by the people of all functions involving the PM. The PM thus lost an opportunity to acquaint himself with the problems and grievances of the people as experienced by them. More or less the same thing happened in Assam. The PM received lots of memoranda from social and political organisations, but there was hardly any discussion. In fact the PM had appeared to come with solutions in his pocket even before he formed any first-hand idea of the problems.

His pre-conceived solutions included modernisation of an airport in a region poorly

served by railways, speeding up of implementation of projects already initiated by previous regimes, Rs 500 crore financial assistance to combat the floods that plague Assam and use of the mighty Brahmaputra to generate power. As a matter of fact an outlay of thousands of crores of rupees will be required to tame the Brahmaputra and one is not sure how helpful it might be to the small and subsistence farmers, the rural majority. In the face of an outcry against army atrocities the PM expressed warm appreciation of the 'peace-keeping' role of the army.

Further a commission was to be formed to go into the entire question of underdevelopment of the region and submit its report, complete with solutions or programmes of action within three months. This promptitude is exhilarating to the brave and disturbing to the thoughtful.

New Economic Policy and Old Trade Unions

A K Roy

The condition of the working class and the trade unions under the New Economic Policy takes us back to the pre-independence days when the working class had to fight simultaneously on two fronts: the local capitalists and the foreign imperialist. It is a time for preparing the working class and their organisations, especially those of the organised sector, not for fighting for new economic benefits, but for providing leadership in the great political battle ahead.

THE New Economic Policy (NEP) has posed a new challenge before the old trade unions of the country. An obviously economic battle has become overnight intensely political. The simple has become complex. The matter was straight previously. The battle was between the employer and his employees over sharing the fruits of labour. The target was the local managements or at best the owners. They were visible, perceptible and near at hand. The interaction was direct. Suddenly they have gone very far and even become illusive, beyond the reach of the ordinary strike. When there is confusion about who the owner is, what action is required will always remain uncertain. Earlier production relations meant those between the employers and the employees, the class position was determined by one's place in the ownership of the means of production. So the class interests of the employers and the employees were mutually opposed.

Now the picture is blurred with the entry of a third party lording it over both. All the economic activities in the country are now

being tied with the global economy. This has brought a new factor, international division of labour, into play, having a great bearing on local disputes – putting traditional trade unionism in an awkward position, having no definite say in the matter. The tall master who looked almighty is now reduced to a sly dwarf subserving the interest of some invisible forces deciding everything. With the real authority ruling by remote control, a new weapon is needed for the working class to strike the far-off targets. This calls for suitable political warhead on the economic missiles. In short, the fight against capitalism has changed into that against imperialism eating into the economic sovereignty of the country. This development is the gift of the New Economic Policy.

The problem with contemporary trade unionism, already in an unenviable position, has been further aggravated as, just when the horizon of encounter is expanding, it is getting confined into even narrower premises of sectional economic bargaining reaching nowhere and failing to put up any resistance

to the new onslaught of the international monetary forces and getting further marginalised in the decision-making process of national politics, as evidenced by its total irrelevance in the last Lok Sabha election.

This takes us instantly to the pre-independence days when the working class had to fight simultaneously on two fronts: local capitalists and the foreign imperialist. The working class had contradictions with both. However, the contradiction with British imperialism was always considered by the working class as principal. The workers of Bombay went on strike against the arrest of the nationalist leader Bal Gangadhar Tilak (July 1908) which evoked comments from Lenin from far-off Russia: "In India too, the proletariat has already developed conscious political mass struggle and, that being the case, the Russian-style British regime in India is doomed". However, with the clock of history moving backward as capitalism has returned to Russia, so in India the old imperialism, officially pronounced 'doomed' in 1947, is again slowly returning in a new form spreading economic bondage through the World Bank, the IMF and MNCs as ordained by the NEP. Nevertheless, the difference in the attitude of the working class and the bourgeoisie even in the pre-independence days is worth mentioning. The working class adored the nationalist leaders fighting British imperialism and wanted to have Tilak as its first president in the All-India Trade Union Congress in Bombay in 1920 and, after his sudden death, chose Lala Lajpat Rai, but the emerging Indian bourgeoisie despite having its contradiction with the foreign imperialist power always considered the working class as its main enemy and used to approach the same imperial power for use of force to curb workers when the latter agitated for a better livelihood. The position is ably described by Hooja Bhupendra in his *A Martyr's Note Book* (1994): "The position of the Indian proletariat is, today, extremely critical. It has to bear the onslaught of foreign capitalism on one hand and the treacherous attack of Indian capitalism on the other; the latter is showing a progressive tendency to join the forces with the former."

The position is similar today. The NEP is the offshoot of the grand bourgeois design to put the world into new shackles through 'privatisation', liberalisation and globalisation replacing the old slogans of 'Liberty, Equality and Fraternity' breaking the shackles of feudalism. In place of one East India Company, the door has been opened to so many multinational companies and for hot foreign money to flood the share market. Many Indian companies have

already been swallowed up either by merger or raising the foreign equity to 51 per cent. The Indian capitalists have become apprehensive and their fear got expressed through the Bombay Club some time ago. N A Palkhivala who generally invites foreign capital raising both hands struck a note of caution in his speech on 1995-96 Union Budget in Calcutta last year and this year preferred to keep mum. The various scams involving more than 10,000 crore of rupees are the direct result of the deregulation and chaos let loose by the NEP with moral-cultural degradation and religious fundamentalism threatening the very existence of the nation, against the background of menacing international

developments, the latest being the triumph of dark forces in Afghanistan encouraged by the US which is lording it over the entire world after the destruction of the Soviet Union.

However, these developments, though alarming both within the country and outside, should not give an impression that the ruling class is contemplating any resistance or that it is thinking of taking any risk. The retreat on Enron, silence on Bailadilla and the other apologetic steps amply prove that the opposition of the Indian capitalists to MNCs and the foreign powers is only a show or at the most intended to exact some concession in economic bargaining. But the hostility to the working class is real and fierce, as manifested

OXFAM requires

A Project Officer for the Central India Programme

Oxfam is a secular development agency supporting a wide range of development initiatives in India. Oxfam also responds to disaster situations with relief and rehabilitation work.

We are looking for a committed person sensitive to the particular needs of tribal development to join our team working in the central tribal belt of India. Responsibilities include project appraisal; close interaction with NGOs; and developing the capacities of partners in research, planning, the use of development techniques, monitoring & evaluation and the implementation of gender sensitive projects.

The successful candidate will have a minimum of a bachelor's qualification in an appropriate social science, 3 years of relevant experience, project management skills and the ability to work as part of a team. Fluency in English and Hindi/Marathi are essential.

The post will initially be based in Nagpur and will be relocated to Bhopal by December 1997. It will require considerable travel. We offer a 5-year contract for this post and a reasonable salary to attract competent professionals. Women candidates are especially encouraged to apply. Only short listed candidates will be contacted for interviews.

Apply with full CV and covering letter explaining fully how you meet the criteria listed above by the 20th of November 1996. No enquiries on phone or in person, please.

The application should be sent to:

OXFAM (INDIA) TRUST

19 Gazetted Officer's Colony, P O Box 71, Nagpur 440001, Maharashtra.

in their denial to yield any new benefit and their all-out effort to withdraw what had already been given earlier. Even the Indian employers are opposed to the concept of recognition of the union by secret ballot and workers' participation in management as endorsed by the law and proposed by the Constitution. So the contradiction between Indian capitalists and their workers is much more real than that between the Indian capitalists and the MNCs. The Indian capitalists would even prefer a shelter in the stomach of the MNCs to being in the company of the workers fighting for economic sovereignty, though that would be in their interest too. As the case stands today, the Indian capitalists have reconciled themselves to their auxiliary role as a junior partner of the MNCs and so have fallen in line with the NEP and the so-called 'swadeshi' movement of the BJP in Maruti cars is gradually on the way out.

What is more, the ordeal before the working class does not end there. Though the forming of the new United Front government at the centre has been celebrated as the great victory of the left and democratic forces of the country leading the trade unions, the budget for 1996-97 shows it is old wine in a new bottle. Rather the problem is made worse when the United Front government comes up with anti-labour laws such as the Employees' Pension Scheme which the trade unions had opposed only the other day. The scheme has now been adopted, something which the earlier Congress government could not do. Now new plans of agitation are being drawn up to fight the 'anti-labour policies' of the new government in which the leaders of the workers are participating. Those who were delighted to see the Congress(I) fragmented before Lok Sabha election are now finding themselves divided in the subsequent political process. Thus both the position today and the one earlier bring home the basic truth that the NEP is not a party phenomenon but a class phenomenon. So chief ministers of all colours fly together to court foreign capital and governments of all compositions make similar budgets as the ruling elites of all parties are having gradually the same class-roots, belonging to the unproductive or parasitic section of society to which the NEP panders and on which the MNCs thrive. The unproductive class (the bourgeoisie plus the middle class) after losing its anti-imperialist character and becoming a collaborator is rolling in consumerism and looking for assured comfort and so is morally unfit and politically unsteady to stand up against the global assault against our economic independence in this unipolar world. The position of the Indian capitalists and rulers

is similar to that of the Rajas and Nawabs of the 18th century opting for subsidiary alliances with the British power, thus handing over the country peacefully to it without any serious encounters. To create a psychological atmosphere for the peaceful transfer of sovereignty history is also being reassessed, eulogising the British raj, preaching that 'dependence is golden and independence is a burden', praising Mir Jaffar and the Macaulay cult, spreading English medium schools and the 'mummy daddy TV culture' at home, cutting all emotional ties with the soil. The new residential complex now being built in New Delhi to house World Bank officials is likely to be transformed into the 'Residency' in due course.

While the picture is not yet fully clear nor are all the answers to the questions it has raised ready at hand, one outcome of the NEP digging canals for foreign capital and sailing on them is obvious. It will hurt the working class and has already started hurting it. The position of the working class had never touched such humiliating depths. Today capital is an asset and labour a liability, with an Entry Policy for capital with concessions and exemptions of all sorts and an Exit Policy for workers even though capital is nothing but the product of labour. The Marxist chief minister of West Bengal is touring the world to find capital, while the best capital to build the state lies on his own shelves. That is *Das Capital* of Karl Marx. The fall of the Soviet Union was not because it followed that wisdom but because it diluted it in the last stages and the same fate is awaiting us once Congressmen stop feuding amongst themselves. It is ridiculous to think that a handful of foreign companies will come and cure the economic ills of the country. Rather, they will inject an alien motivation snapping all emotional attachment with the country. If nationalisation has failed to revive some sick units, privatisation has failed in all cases except acting as the scrap-dealer. If the country is privatised it is too likely to be sold as scrap, provided there is a taker. The effect of globalisation would be even more disastrous. Every foreign company that would come would kill at least ten Indian concerns, as happened at the beginning of British raj as narrated both by Dadabhai Naorojee and Karl Marx, thus further aggravating poverty and unemployment while creating isolated pockets of affluence. Capital mostly comes in the form of machines and equipment and the import of every machine means snatching work from the Indian labour engaged in making such machines, thus substituting Indian labour by foreign labour while declaring the country to be labour surplus. Thus in addition to remitting surplus generated as

profit, interest, service charges, fees, etc, the entry of foreign capital means entry of unemployment and permanent underdevelopment and dependence, except for developing a small section of the upper strata of the society acting as intermediaries and engaged in scams. So the NEP is not an economic strategy but a political process of ruling by proxy by the international capitalism and to make the process smooth and foolproof the working class is being systematically demoralised and the trade unions are being corrupted with economism.

If religion is the opium to the people, economism and consumerism are the same to the working class. That such an absurd and degrading arrangement as the NEP could come to exist shows that workers are under the spell of that opium. So it is a time to prepare the working class and its trade unions, specially the organised sections, not for fighting for any new economic benefit, but for giving leadership in the great political battle ahead which may be called the Second Independence Struggle for wresting power from the parasitic intermediaries and giving it to the real Indian people. According to Marx, "The first step in the movement by the working class is to raise the proletariat to the position of the ruling class to win the battle for democracy". So only politics should prevail over the country, that is, workers' politics and the country's politics needs the direct intervention of the working class, reminding one of the call at the first session of the AITUC in 1920 in Bombay by Dewan Chamanlal, the general secretary: "Workers of India, the time has come for you to assert your right as the arbiters of our country's destiny. You cannot stand aloof from the streams of national life. Every movement on the political chess-board, every step in the financial and economic arrangements of your country affects you more than it affects any other class. You must be conscious of your responsibilities. You must understand your rights. You must prepare yourself to realise your destiny. A Factory Act or law cannot give you justice. Your salvation lies in the strength of your organisation. Cast all weakness and you will surely tread the path to power and freedom."

State, Class and 'Sena' Nexus

Bathani Tola Massacre

Arvind Sinha
Indu Sinha

The recent Bathani Tola massacre in Bhojpur district of central Bihar again highlights the ongoing suppression of the struggles of the underprivileged by private armies of upper castes in alliance with the middle caste state apparatus.

THE thoroughfares of Patna witnessed a victory procession under the leadership of the CPI(ML) (Liberation) in mid-September after they had got chief minister Laloo Prasad Yadav to agree to their demands over the Bathani Tola-related issues. Under the terms of this agreement, the district magistrate (DM) and the superintendent of police (SP) of Bhojpur district have been transferred and an enquiry has been ordered by the board of revenue, Bihar government into the Bathani Tola massacre. The fasting CPI(ML) leaders including Rameshwar Pandit, MLA from Sahar constituency, under which Bathani Tola falls, broke their fast following the agreement with the chief minister. The leading light of the CPI(ML) (Liberation) Nag Bhushan Pattnaik has also termed this agreement as the 'victory of the democratic forces'. Whether it is a 'victory of the democratic forces' or a 'low-level compromise before the aiders and abettors' of this gory incident – one is compelled to give some thought to this question.

The union home minister Indrajit Gupta on his visit to Bathani Tola said that this carnage had proved the total failure of the police administration in the state. The Bihar director-general of police openly admitted that the police could have averted this brutal incident. This incident, worse than the Mai-Lai incident in Vietnam, in which the American troops had killed innocent Vietnamese peasants, compels one to question the very 'sense of victory' among the CPI(ML) (Liberation) leadership.

GENESIS OF MASSACRE

The barbaric massacre of 19 people took place in Bathani Tola hamlet of Badki Khadaon village, of the Sahar block of Bhojpur district. Considered to be the most barbaric carnage of its kind in Bihar, for the first time 13 women and eight children (the youngest of whom was a two-month-old baby) were killed. The victims included only one man. All the victims were gunned down by the well-armed marauders, nearly 150-200 in number, belonging to the Ranveer

Sena. The Ranveer Sena's killers converged on the village at about 1 pm in broad daylight, firing indiscriminately; the inhabitants of the village tried to resist with traditional weapons but had to retreat in face of a shower of bullets from every corner. They fled into open fields; their huts were set on fire. The marauders continued with this mayhem for nearly an hour. While a special police camp was only one km away from Bathani Tola and the Sahar police at a distance of 7 kms, the police arrived at the spot by late evening, and the DM and the SP paid their visits by midnight. The village residents alleged a connivance between the Ranveer Sena, local police, and the district administration. It is an open secret that Ranveer Sena has the patronage of BJP and Congress (I), and covert support of the Laloo Prasad government and the ruling Janata Dal. The district administration was informed about 'apprehensions' of such an attack by Ranveer Sena as tension prevailed in the village following conflicts between the landlords and the downtrodden. The district administration had set up a police outpost in response to the tension. In spite of this, carnage took place and the local administration failed in its responsibility to protect the innocent lives.

The victims belonged to dalit, OBC and Muslim communities, mostly poor and marginal peasants. Ranveer Sena is composed of criminal youths drawn from (mainly) bhumihar and rajput castes. Landholders belonging to these two dominant upper castes, while securing their own offspring's future in urban educational institutions, business, and coveted jobs, have drawn upon their poor caste fellows, especially youths, for constituting the Sena. The 'use' of caste feelings for serving class interests is apparent in the composition of Ranveer Sena.

What was it that led to the massacre in Bathani Tola? Was it a communal question, a caste question, a class question, or to add one more dimension, was it a gender question? The last dimension was highlighted by a feminist organisation arguing that the

victims of the massacre were women ('nari samhar').

The Badki Khadaon village, of which Bathani Tola is a part, is located about 43 km away from Arab town, the district headquarters of Bhojpur district. The village has nearly 400 households, comprising mostly of dalits, Muslims, and OBCs (Table 1). Most of them are agricultural labourers-cum-poor peasants. Substantial part of the land belongs to the upper castes like bhumihar and rajput. Since 1988, agrarian struggles over minimum wages and 'gairmajarua' (government land) land are being waged. The struggle for minimum wages led to a total strike in 1994, which brought all agricultural operations to a halt. The local administration intervened into the matter in 1995 and cultivation work was resumed after amicably resolving the minimum wage issue. The agrarian tension erupted again on the issue of illegal occupying of more than 100 acres (according to local sources) of gairmajarua land by the landlords. However, according to the block development officer, Sahar, gairmajarua land is in all 25-30 acres, which, he conceded, should have been distributed to the landless. Adding fuel to the fire, some rajput landlords occupied 1.5 acres of Karbala land and also a part of land leading to the Imainbada. Such encroachment interfered with the religious celebration of the local Muslims.

Such attitude on part of upper caste landholders is not unusual in Bhojpur. Unusual was the protest by the oppressed

people, who were not ready to accept this semi-feudal socio-economic order which denied them their minimum human, democratic rights. The landless and poor started agitating against the land-grabbers to rescue the Karbala and Imambada land. Not only the Muslims, but all residents of Bathani Tola took up the issue. The occupation of 100 acres gaimajarua land was already on their agenda. The Karbala and Imambada land came as immediate issue.

Notably, the anti-feudal democratic unity of people in Badki Khadaon village was achieved much before the CPI(ML) (Liberation) appeared on the scene. In 1978, when the people elected Mohammed Yunus, an educated leader from the downtrodden as mukhia (village headman) of Dhauchuhan gram panchayat, under which Badki Khadaon and Bathani Tola come, the bhumihar and rajput landlords found it difficult to digest. The entry of the CPI(ML) (Liberation) a decade later, in 1988, added new muscle and militancy to their ongoing anti-feudal struggle.

Armed clashes started in January this year, leading to the killing of previous mukhia Keshav Singh and his accomplice Santa Singh. The landlords retaliated by killing Mohammed Sultan of Badki Khadaon in April 1996. Terrorised by this killing Naimuddin and four other Muslim families fled from the village and started living in Bathani Tola. Naimuddin had led the protest demonstration against the killing of Mohammed Sultan. Hence, he had become an eyesore of the landlords.

Ranveer Sena was contacted and preparation began for the final onslaught. They thrice tested the preparedness of Bathani

Tola residents before the final attack, on July 3-5. The district administration was informed about the nefarious design of Ranveer Sena. The administration set up several police outposts (Table 2) around Bathani Tola. But no action was taken against legally banned Ranveer Sena or their local allies. The political masters and accomplices of Ranveer Sena in the BJP, the Congress(I) and the Janata Dal effectively managed the local administration in their favour. Administrative inaction emboldened Ranveer Sena and the landlords of Badki Khadaon. Their assessment of the situation proved to be correct as they could conduct their worst acts in broad daylight with full impunity and without any interference of the state.

Yet, how come the transfer of DM and SP, and an enquiry by the board of revenue has been hailed by a seasoned revolutionary like Nag Bhushan Patnaik as the 'victory of the democratic forces'? People know the realities of government enquiries. How can an enquiry by the government serve the purpose, when the government itself is in the dock? The dithering of CPI(ML) (Liberation) is equally surprising. First, it demanded resignation of the Laloo Prasad government; then it demanded dismissal of the DM and SP from their services; and finally, it compromised with the Laloo Prasad government, by hailing the institution of inquiry as a 'victory of the democratic forces'.

CLASS INTEREST AS SUPREME

Interestingly, in spite of BJP's involvement, the local landlords and the Ranveer Sena could not turn the conflict into a communal one. BJP's decade long campaign

in Bhojpur for shilanyas, and scores of rath yatras including one led by L K Advani could not break the class solidarity. Though the immediate issue involved the Imambada and Karbala lands, both Hindus and Muslims fought for its rescue under Naxalite ideology and political leadership. This case reveals a different sort of alliance of dalits, OBCs, and Muslims *vis-a-vis* their alliance formed by Janata Dal for electoral politics. It is the suppression of class identity *vis-a-vis* caste, which led the Laloo Prasad government to extend support to the upper caste landlords of Bhojpur and the Ranveer Sena. Significantly, bhumihars are the main component of Ranveer Sena and the Laloo Prasad government is trying tooth and nail to marginalise them as they are at loggerheads with yadavs. Extending support to Ranveer Sena in such a situation is 'unusual', but this supports the above argument. Bathani Tola case also presents the coming together of the BJP, the Congress(I) and the Janata Dal, to suppress the rising upsurge of the downtrodden.

The seeds of 'Naxalism sown in Bhojpur in 1967 assembly elections. The present Sahar MLA Rameshwar Pandit was then a CPM candidate from Sahar and Jagdish master was his election-in-charge. The landlords usually did not allow dalits and OBCs to caste their votes. The people of Ekwari village protested against the booth capturing but could not succeed in exercising their voting rights. The landlords humiliated Jagdish master and scores of others were brutally treated. This suppression led many to quit the CPM and follow the Naxalite way. Naxalism has been spreading in other parts of Bhojpur since then, and people have

TABLE 1: HOUSEHOLD COMPOSITION OF BADKI KHADAON

been struggling against the notorious landlords of Bhojpur who understood no other language but of bullets. In the ensuing battles nearly 200 people lost their lives before Bathant Tola massacre occurred.

So, it is wrong to consider the ongoing conflict as a war for supremacy between the Naxalites and the Ranveer Sena, as has been projected by the popular media, and perceived by the urban middle class residing in Patna and other places. This explanation conceals that the basic struggle is between the haves and have nots, in which Ranveer Sena is protecting the interests and supremacy of the former whereas Naxalites are fighting for the rights of the latter.

Substantial part of Bhojpur district falls under the Sone canal system. The land is very fertile and was selected for the green revolution package. While the landed gentry, mostly from upper caste groups, greatly benefited from green revolution, the overall condition of the poor and marginal peasants worsened. The landlords and the rich peasants were pretty happy to embrace the benefits of the new technology. However, they continued with the existing semi-feudal relations in production. Needless to say, even the bourgeois democratic rights were not allowed to the peasants. This conflict between the productive forces and the relations of production is the root cause of the ongoing socio-economic conflict for political supremacy between the CPI(ML) and the ruling classes. It is being projected by the bourgeois press, and also being alleged by social and political organisations, that the Naxalite forces are 'aggressive' and are mainly responsible for such massacres. The facts presented below, however, speak otherwise. It is evident from Table 3 that it is Ranveer Sena which committed nine out of 14 massacres, and the frequency of massacres has increased since the formation of Ranveer Sena in 1995.

HISTORY OF STATE AND POLITICAL PARTIES IN BIHAR

People in metropolis, especially a section of intellectuals and media persons, talk with great disdain about the happenings in Bihar. The attitude is often contemptuous and approach towards the problem dismissive. People forget the brutality perpetrated in different parts of the country after Babri mosque demolition; they forget what happened in Punjab and continues to happen in the north-east and Jammu and Kashmir. They also seem to forget the Behmai massacre in Uttar Pradesh and the planned rape and brutality meted out to the Uttarakhand processionists on their route to Delhi. Mafiosi and police brutality are a national

phenomenon. Therefore, the approach should be to comprehend and analyse formation of the armed organisations like Ranveer Sena rather than dismissing Bathani Tola incident as an aberration peculiar to Bihari society, not to be found elsewhere. If Bihar presents extreme degeneration of present socio-political set-up, the regeneration expressed in conscious organised revolt of the downtrodden against the existing system is another face of the Bihari social environment.

The collapse of the state and its administrative machinery has resulted in a dual or parallel system in different spheres of Bihari social life. The collapse of the state-run education system has led thousands of private educational institutions to spring up throughout Bihar. Same is the fate of state-run health care system. The prime source of income for thousands of state employed doctors is their private clinics and nursing homes. The state-run hospitals have become death traps. Power supply in the state is equally ad hoc. Water of state-run water supply system is so contaminated, especially during the monsoon that it perpetually becomes a source of water-borne diseases. Even the big police force proves to be totally incapable of providing even the minimum safety and security to the citizens. Bihar tops in killings, kidnappings, custodial deaths in the country. In most places police is in connivance with the criminals, gangsters, and mafia.

It is necessary to understand the twin formation of landlord's private senas and people's self-defence guerrilla squads against this background. The landlords have been maintaining armed organisations since British days. The land owning classes utilised their local powers in strengthening their clout in the legal constitutional government and its administrative set-up after independence. This state of affairs was relentlessly opposed by common people and organised left-democratic forces in the state.

The ruling classes got alarmed when people started exercising their voting power against the entrenched feudal forces. The semi-feudal forces could not fight and defeat this current head on; so they opted for sabotaging it in a covert way. They devised ways to manipulate the electoral process through dubious means of bogus voting, booth capturing using armed might. They subverted the land reforms laws in Bihar. An explosive situation emerged in rural Bihar due to rising expectations of the underprivileged, on the one hand, and its suppression by the privileged, on the other. The landlords have been utilising all political options from Congress(I) to BJP and Janata Dal while the poor peasants have tried options from socialists to CPI to Naxalites. The peasant

struggles suffered a setback during emergency when the CPI sided with the Congress (I); CPI's compromising attitude dampened their anti-feudal struggle. Their struggle suffered another blow when the socialists joined Janata Party and abandoned their anti-feudal line. Other left forces were not strong enough in Bihar to make their presence felt. So the poor peasants turned towards the Naxalites in big way after emergency. The memory of the heroic struggle of Musahari in Muzaffarpur district under Naxalite leadership was fresh in their minds.

The Naxalite forces were also trying to develop militant peasant struggle in a new way having learnt from the Naxalbari uprising, which was suppressed due to its adventurist line. So they adopted mass line in the second phase of their struggle after emergency. The arena of struggle in this phase shifted from north Bihar to central Bihar, encircling Patna and Bhojpur districts.

A new development that took place in post-emergency Bihar, and in central Bihar in particular, was the rise of middle castes in socio-economic and political hierarchy. Middle castes were organised in a big way by the Samyukta Socialist Party (SSP). Lohiaste ideology of caste-based reservations in education and government employment was big attraction for them. They shared political power for the first time in 1967 non-Congress government at the state level. It generated lust for more power. They got a bigger opportunity in 1977 in Karpooori Thakur government. The subsequent years saw tremendous consolidation and rise of yadav, kurmi, and koeri castes. This newly emerged power elite was aggressive against the upper castes as well as against dalits and other unprivileged groups. Because of this they came into direct confrontation with the rising movement of landless, poor peasants, mostly dalits, who were mobilised under the Naxalite leadership. It resulted in the infamous Belchhi massacre in 1978, which prodded Indira Gandhi to visit Belchhi in order to woo the dalits. The dalits, however, were not in a mood to relent. In Naxalism they found an ideology and politics which matched their deep-rooted determination to fight for their liberation. Their struggles spread throughout central and south-central Bihar. The extra-constitutional domain of power of the ruling classes was grievously threatened by waves of militant peasant struggles led by different Naxalite groups. Hundreds of landlords had to flee from their strongholds towards the cities in central Bihar. It was only a tactical retreat, not a total defeat. The state and its oppressive machinery was still intact; moreover, there was the political and economic support of the big capitalist class

together with the foreign imperialist powers. Conspiracies were hatched by the ruling classes to finish off the rising peasant movements. The result was the formation of state-backed caste-based senas: *Bhumi Sena* (kurmi), *Lorik Sena* (yadav), *Brahmarshi Sena* (bhumihaar), *Kunwar Sena* (rajput), etc. Then began the deluge of murder, mayhem and massacres.

Central Bihar witnessed scores of massacres from Pipra onwards; but it was also destined to witness the strength and power of revolutionary egalitarian ideology as well. Those who did not have enough to eat and feed their children succeeded in defeating and liquidating most of these senas, the *Bhumi Sena* being the most barbarous of them. In frenzy, the ruling classes threw away all norms of civility and constitutional functioning, and the state came out openly against the downtrodden, defending the rural rich. The blatant manifestation of this was Arwal massacre in 1986 by the police itself.

RISE OF RANVEER SENA

It is not the first time that Bhojpur is experiencing the formation of senas. The forerunners of Ranveer Sena were *Brahmarshi* and *Kunwar Sena* which could not sustain for long. Then the local ruling classes were divided along caste lines. The Mandalisation of politics aggravated the conflict between the upper and the middle castes. But, once the Mandal forces got consolidated on the political map of Bihar the upper caste landlords initiated the process of aligning with the Mandal forces to counter the challenge of the militant poor. This process got momentum after Jwala Singh, a dreaded rajput landlord and manager of Danwar Bihta carnage, joined Janata Dal. This strategy of the ruling classes culminated into the formation of upper caste Ranveer Sena in 1994 with the full backing of the middle castes and local level district administration. It is this formidable alliance which unleashed terror in Bathani Tola to wipe out Naxalism from Bhojpur.

The formation of Ranveer Sena is indicative of class polarisation from above. This is not a caste sena as happened to be the case with other private senas. The class aspect is fairly pronounced in Ranveer Sena's support base and functioning. *Bhumihar* and *rajput* caste people have never seen eye to eye and have a history of being mutual foes throughout Bihar. They have now joined hands to form Ranveer Sena. Further, it is the class interest which goaded the ruling stratum of the middle castes to extend support to the sena.

The same trend could be seen in Palamau, Patna, Gaya, Jehanabad, Aurangabad and Nalanda. There existed intemecine fights

between the pathan landlords and rajput, bhumihar and brahmin landlords in Palamau. But they forged an alliance under Sunlight Sena (which was formed by the pathans) when their economic interests and socio-political authority was challenged by peasants fighting under Naxalite leadership. An interesting feature of Palamau is the powerful presence of the BJP, and yet it could not tamper with the class interests of brahmin and other upper caste Hindu landlords of Sunlight Sena. By contrast, the poor and backward Muslim groups are united with the poor Hindu caste fellows and dalits under Naxalite leadership.

Similar is the case with the Kisan Sangha of Magadh range in central Bihar, which is an armed organisation composed of criminal elements and their political masters from yadav, kurmi, bhumihar and rajput castes. It was formed allegedly at the behest of ex-union minister for chemicals and fertilisers, Ram Lakhan Singh Yadav. Caste feuds have given way to class collaboration.

IN SELF DEFENCE

Depicting the prevailing situation in Bihar the People's Union for Civil Rights stated

in one of its reports, "if someone is alive in Bihar it is because nobody is interested in killing him". This statement is very illustrative. The state has totally abdicated its responsibility of safeguarding the life and liberty of its citizens. This situation coupled with organised assault by forces like Ranveer Sena creates extremely insecure survival conditions for common people. But when common people get organised, they are branded as 'violent', 'lawless' by the state, media, and the ruling politicians. But there exists no law in the state. Incidents like Bathani Tola, fodder scam, and two recent cases of state violence against a woman and a girl-child clearly reveal this reality. The paramilitary forces deployed after every massacre, do nothing to the forces like Ranveer Sena. Instead they harass poor people in the name of wiping out Naxalism. Under search operations whatever country-made small arms they have for their defence are seized.

It was heartening that after Arwal massacre in 1986, for the first time different Naxal groups and other democratic organisations came on a common platform and held a convention on this issue on August 27 in

Patna. A cautionary note was sounded that people's movements should beware of two negative trends that very often creep into their functioning. Firstly, gun can solve all problems and hence what is required is sufficient guns to liquidate Ranveer Sena. This line of thought denies common people any role. The other line of thought emanates from traditional left wing politics according to which people's organisations should make much propaganda of the issue exposing thereby the ruling party; mass protests should be held to highlight the issue. Ultimate aim should be to defeat the ruling party at the hustings and grab political power through elections. In this line of action too, people are confined to casting their vote to dislodge the ruling party and bringing the parliamentary left to power. This approach grossly neglects the need to empower people.

What is really needed is empowerment of people through their own mobilisation and struggle. Different organisations and individuals who are actually with the people have to play their role in helping this process. Strength of people's own organisation alone could be a real and genuine solution.

Value, Prices and Distribution

The Ricardo-Marx-Sraffa System

K.C. Roychowdhury

This book provides a rigorous but lucid introduction to the analytical foundations of classical and Marxian political economy in the light of the sraffian system. The focus is on the relations between values, prices, capital and income distribution in the context of the Ricardo-Marx-sraffa paradigm. The author gives a spectrum of specific analytical models to clarify the different aspects of classical and Marxian economic theory.

Afghanistan: 'Great Game' Renewed

Gautam Navlakha

Indian foreign policy always perceives regional issues from the perspective of its rivalry with Pakistan. This is evident in official assessments of recent events in Afghanistan, which are obsessed with Pakistan's role in the Taliban victory but silent on US connivance. To gain credibility in the region, India also needs to take a stand on the human rights issues thrown up by the Afghan situation.

TALIBAN takeover of Kabul on September 27 has received wide attention for the new regime's unabashed reactionary policies which are aimed at shackling Afghan women and which will precipitate ethnic conflict. Decrees issued by the Taliban prohibit education for girl children, women from working outside the home (thus hampering the relief operations of the UN and other relief agencies who were helping 2,00,000 people a day in Kabul and looking after more than 1,00,000 orphans), kite-flying and marble playing for children, along with music, dancing, television, films, etc. By prohibiting women from working, the educational system has closed down because the teachers were mostly women. Literacy rates are abominably low: 10 per cent for males and just 1 per cent for women. Hospitals are severely handicapped without nurses. More than 26,000 widows in the city of Kabul who through their labour looked after their families in this war-ravaged city are dependent on handouts and the benevolence of the new rulers. Moreover, deviation from the regimented life which involves a dress code is severely punished. Amnesty International claims that reprisals have been carried out by Taliban against minority groups, especially the Tajiks, and that 1,000 persons have disappeared since they took over Kabul on September 27. Nevertheless, what initially appeared to pave the way for the northward expansion of Taliban has been reversed. Rival factions Jamiat-i-Islami headed by Burhanuddin Rabbani and Jumbish-i-Milli of Rashid Dostum signed a military alliance which brought together two former rivals, Ahmad Shah Masood and Dostum along with Karim Khalili representing Shia Muslims and Jaffar Nauderi the Ismailis, against the Taliban. This see-saw battle for Kabul began with the forces of Abdul Shah Masood recapturing Bagram airport on October 21. This triggered moves to bring about a cease-fire with the UN, OIC, and Pakistan trying to mediate, but they got stuck on the issue of pre-condition. Taliban wanted a swap of prisoners and refused to move out of Kabul. The alliance wanted Taliban to quit Kabul and the city demilitarised under UN peace-keeping forces. The UN security council also passed a resolution which called for foreign countries not to interfere and an end to supply of weapons, and denounced

discriminatory policies against women. This resolution, together with the continued recognition of the Rabbani government by the UN, amounts to a major diplomatic setback for Taliban.

As of now, however, the balance of forces has shifted in favour of Dostum, whose 45,000-strong force has remained neutral since 1992 and has only now engaged in fighting the Taliban. This is ironical given that his force is the last remaining vestige of the PDPA that ruled Kabul between 1978-92 with Russian backing! He joined hands with the Mujahideens only towards the end. Also, Taliban is a recent phenomenon, having emerged in 1994 and having played no role in the resistance against the Russian-backed regime. Above all, it is Ahmad Shah Masood, whose force provided the most formidable resistance to the Russian-backed PDPA from within Afghanistan, who today represents the voice of moderation. In the press conference given by Masood after retaking Jab-ul-Siraj, he condemned Taliban for being a foreign force and added that the Afghan people do not want Islamic fundamentalism.

It took the US four days to register its disapproval of the killing of Najibullah who was living under UN protection. They instead announced the sending of a high level envoy to Kabul to meet the Taliban leaders to determine the prospects of re-establishing a US presence in Afghanistan. They became ambivalent when the media began highlighting measures announced by Taliban. Once the UN secretary-general decided to denounce Taliban's obnoxious decrees (possibly to embarrass a hostile Clinton administration which opposes his re-election), the US found itself compelled to term its diplomatic initiatives with Taliban leaders as 'contacts'. The US (or UN) is known to use human rights selectively as an instrument of coercive diplomacy. Both the UN and the US have been silent on the denial of voting rights to women in the recently held Kuwaiti elections and on the disenfranchisement of Bedouins after the anti-Iraq war. Also, much before Taliban moved into Kabul they had imposed similar decrees in areas under their control without inviting international opprobrium. The US assessment was that Taliban did not practise anti-US fundamentalism such as Iran does. In the last two years not only did the US maintain diplomatic contacts with Taliban,

but it never once tried to press them to move for national reconciliation by starting talks with rival factions. So if now the US claims it is "opposed to the policies of Taliban concerning women", it need not be taken seriously. The US spokesperson also said on October 8 that the US intended to "serve its national interests".

EMERGENCE OF TALIBAN

Fifteen years of struggle against the Soviet army and PDPA followed by the last three years of internecine war between the Mujahideens have destroyed the social fabric of Afghanistan. More than six million became refugees and the entire economy was disrupted. Resistance against the Soviet-backed regime was not united. Mujahideens were split among seven factions which were organised along ethnic and sectarian lines. As long as Russian troops remained, a tenuous unity was maintained. With the withdrawal of Russian troops followed by the collapse of PDPA, a coalition headed by Masood's force took over control of Kabul. This was in keeping with the decisive role of Masood's army, which not only was less dependent on outsiders but unlike other forces did not use Peshawar as its operational base. This triggered off full-scale fighting mainly between Rabbani's Jamiat-i-Islami and the Hezb-i-Islam led by Gulbuddin Hekmatyar, with the latter insisting on Pakhtoon leadership in government. Towards the last months of the Rabbani-Masood government in Kabul, Hekmatyar, sidelined by his Saudi mentors, joined the government as the prime minister, but has since parted company with them. Taliban emerged only in 1994 from the debris of civil war from among millions of refugees living in the camps in Pakistan. The main supporters of Afghan resistance in the 1980s had projected this war as a war in defence of religion, thereby colouring the nature of support it invited. Apart from US arms supplies and relief provided by UN and western agencies, as far as the future was concerned they were left at the mercy of the innumerable 'madrasas' that sprouted due to Saudi Arah munificence, thus ensuring the ideological dominance of the Saudis who are the main bulwark of retrogression. The children of refugees educated in these madrasas go on to form the bulk of the foot soldiers of Taliban. However, it is not their ideology that won them accolade. Taliban was seen as a force that was capable of replacing warring factions. For instance, prior to Taliban's takeover the city of Kabul was divided between factions which demanded their pound of flesh. In addition, the battle for control over Kabul continued causing massive loss of life. In last three years alone, reportedly 30,000-40,000 persons died in Kabul due to internecine fighting. In this sense some reports suggest people saw in Taliban a possibility of an end to the civil war. It is this that accounts for the speed with which they took over 70 per cent of the territory in a little over one year. However,

the emergence of Taliban owed much to the support extended by Pakistan.

According to *Jane's Defence Weekly*, "Pakistan's direct support, direction, planning, command and control have been critical to Taliban's success in overrunning Kabul". It adds, "what we have seen is a remarkable level of sophistication of command and control over a range of fast moving fronts, and it simply defies belief that Afghan mullahs are capable of this sort of planning, organisation and execution". For Pakistan, domestic compulsions forced it to come out in support of a faction that was predominantly Pushtoon speaking. The strong affinity between the Pakhtoons of Pakistan with those in Afghanistan ruled out any settlement that saw the emergence of a non-Pakhtoon dominated coalition. It was feared that such an eventuality would prove dangerous for Pakistan, with the likelihood of a Pakhtoon movement enveloping Pakistan. Its interior minister Nasrullah Babar said as much on October 22, warning that a protracted war would split Afghanistan along ethnic lines and that "we in Pakistan will face the repercussions of a divided Afghanistan in perpetuity". In this sense Pakistan's problems have been compounded. The failure of Gulbuddin Hekmatyar to challenge the coalition formed by Burhanuddin Rabbani was followed by the

initial success of Taliban, which now has been stalled by the re-emergence of an alliance between Masood and Dostum. Taliban singled out the force of Masood in the Panjshir valley while offering to talk to Dostum, confident that they could rout the forces of Masood and thereby compel Dostum to accept their terms. This would have effectively paved the way for Afghan unity under Taliban hegemony.

It is not possible for Pakistan to have undertaken this venture without the support of the US, considering that its economic weakness and military dependence make it vulnerable to US arm-twisting. The US did not perceive Taliban as an anti-US force but one that could act as a counterfoil to Iran. Significantly, in the last two years the US did not see any threat in Taliban's espousal of religious militancy. The US assistant secretary of state Robin Raphel in fact went so far as to claim in an interview with BBC that Taliban had "no Pan-Islamic agenda outside Afghanistan". This suggests the high degree of confidence they repose in Taliban. This was reciprocated by them in allowing contacts with US officials (men and women), despite public disavowal of such, in welcoming US aid, and declaring that they wanted "friendly and good relations" with the US. The US did entertain the hope, initially, that Taliban would quickly restore

order in Afghanistan, either unite the entire country or exercise hegemony in the event of national reconciliation, which would allow the US to extend its dominance over the direct trade routes to central Asia which comprises one of the richest sources of oil and natural gas sought after by the multinationals, thereby extending US influence over the central Asian republics at the expense of Russia. Insofar as Taliban have pushed the frontline beyond Pakistan bringing it closer to CAR and Iran, there are diplomatic gains to be made for both Pakistan and the US. But these have to be tempered by the alliance formed by the forces of Masood and Dostum backed by Russia, CAR, Iran and India. CIS held a special session to discuss the Taliban takeover of Kabul and announced that if there was any threat to the CAR "they would take adequate measures". Iran condemned the Taliban and lamented they had made "ugly...this beautiful religion". India too has expressed its disquiet, believing trouble could spill over into Kashmir. The main danger now is that if Masood and Dostum's forces manage to command access to the valleys and passes through the Hindukush, which separates the northern provinces from the south, but are unable to push Taliban away from Kabul and Herat, it could result in a military stalemate and hence in a de facto division of Afghanistan.

NEW FROM SAGE

This pioneering study explicates the Rorschach Test from a clinical-

experiential-cultural point of view with special reference to Indian culture. Designed to equip students and clinicians with the latest advances in the use of the Rorschach Test and method, it provides a real-life context for looking at the responses by relating Rorschach to literature, films and the mundane routines of everyday life.

Since Indian foreign policy perceives the region from the perspective of its rivalry with Pakistan, there is a tendency to assess any evolving situation in the region as being a zero sum game in which every gain for Pakistan is a loss for India. It is interesting to note that both the ministry of foreign affairs (MFA) and the ministry of defence (MOD) in their annual report 1995-96 nowhere refer to the US role in Afghanistan. Its singular obsession with Pakistan emerges as a recurring factor. MFA says that the situation in Afghanistan "continues to be unstable", and goes on to say that it has been "further exacerbated by the interference of Pakistan directly and more so through its creation of Taliban". Taking this a notch higher, MOD says that Taliban "were armed and trained by Pakistan's Inter-Service Intelligence" and goes on to say that "Pakistan's attempts to install a pliable government in Kabul would have serious security implications for us". Significantly, it expresses "serious concern" about where ISI "has been getting funds from" and about the spread of "religious militancy", but refuses to acknowledge any link between US connivance in the matter. This silence is ominous.

The expansion of the US sphere of influence has to be situated in the larger context of its augmented military presence in the Gulf and the Indian Ocean, the acquisition of a new base in Bahrain, the upgrading of Diego Garcia, and evolving military relations with GCC, Pakistan, Sri Lanka, Singapore, Kenya and India. Significantly, whereas Pakistan comes under US Central Command, India's military exercises are undertaken with the Pacific Command. MOD (1995-96) had noted the "US decision in May 1995 to establish the Fifth Fleet under the US Central Command with Bahrain as the homeport", as well as to strengthen its "policy of dual containment of Iraq and Iran" in order to protect "its oil interests" and "wider strategic interests". The last mentioned is not spelled out. In fact, together with MEA (1995-96) it speaks of the Indian defence secretary's visit to the US in September 1995 for the first meeting of the Defence Policy Group (covering security issues) and the Joint Technical Group (co-operation in defence technology), and refers to the May 1995 joint naval exercise. Incidentally, the DPG and JTG were established during the visit of the US defence secretary in January 1995. What these two reports do not say is that the US has shown an interest in using Indian ports for the rest and recreation of its naval forces in the region and using the Indian ship industry for repair and maintenance jobs. It is also seeking to acquire naval and telecommunications facilities from Sri Lanka. This indicates that the US is engaged in bringing a large number of countries under its influence through

bilateral tie-ups in which the overall geo-strategic goal of the US is never brought to the forefront. The small news item on October 25 merely states that at the Indo-US DPG meeting the two sides shared their assessment of the Asia-Pacific region. Just two days prior to this, a similar DPG meeting took place between the US and Pakistan in which the two sides discussed the situation in west and central Asia.

Against this background, developments in Afghanistan acquire a regional character outside the immediate environs of Afghanistan. This perception appears to be missing from the official Indian assessment. Seen in this light, the government of India must proceed on the basis of enlightened self-interest. The Indian government's response has to be based on two factors. In the first place, having been silent during the 1980s when the Afghans were fighting against Soviet intervention, it does not enjoy popular credibility. In fact for years when Pakistan carried the burden of providing refuge for millions of Afghans, the GOI harped on the US arming of Pakistan. Unfolding events in Afghanistan were considered from the vantage point of neutralising Pakistani gains. To do the same by way of support for any faction would be to compound that error. It ought to be clear that it is in the interest of Afghanistan to have good relations with Pakistan, just as it is all right for Pakistan to expect to gain from peace in their having borne the brunt of the burden of millions of refugees. Furthermore, the CAR are trying to break out of skewed trade links with Russia and are desirous of developing alternate routes. Having two outlets to the Arabian Sea for international trade would allow them to reduce dependence on any one route. In this sense, good relations with both Iran and Pakistan are critical for CAR. If this be true for CAR then it will be better for the GOI not to get identified with an Afghan faction, because in the event of national reconciliation it could be left high and dry. The chances of this are not as remote as they appear. The fact that the US, the UN, and OIC have stepped up their pressure for a ceasefire and negotiation is indicative of this. Also, it is doubtful if Taliban can be vanquished militarily without an alternative programme for re-uniting and re-building Afghanistan which elicits the support of substantial sections of the Pushtoon-speaking population; Hekmatyar proved to be an exercise in vain.

Does this mean the world should silently acquiesce in the retrogressive project of Taliban? If India is really concerned at this it has to use multilateral forums to apply pressure for an international peace-keeping force to contain the warring factions paving the way for elections. Which obviously means that India will have to shed its claim of sovereign immunity when discussing human right abuses and suppression of universal democratic rights. It also needs

reiteration that there is an ideological dimension to the conflict. If the GOI believes that religious militancy is the antithesis of India's secular-democracy, then it can carry conviction only if it is seen as defending a non-discriminatory and non-exclusivist polity untainted by appeasement of communal fascists and apathy towards the rights of women and minorities.

Secondly, the GOI must accept that its preoccupation with Pakistan obscures the larger threat posed by the US. With its weapons of mass destruction and strategic tie-ups in the region, the US is prepared to counter any effort which challenges its imperial interest. It is a moot point whether a country which is trying to lure foreign investors can at the same time freeze military relations which deny US easy access in the region. But opposition to US expansion of its sphere of influence in the neighbourhood is vital for India.

Conversely, it must work towards rapprochement with Pakistan, without which it would be placed at a disadvantage in increasing economic relations with CAR. It would be argued that improving relations with Pakistan is a two-way process. But the policy of reciprocity has been a total failure. Unilateral policy measures, many Pakistani commentators and Indian business organisations argue, would encourage growth of trade and allow Pakistani business to consider India as a credible and reliable source. India's history of trade links with CAR could then be seen as an added incentive. The alternative is to obscure the real sources of threat and exaggerate the mutual hostility between neighbours. It is important to note that the Indian government has begun to show signs of discarding old baggage. For instance, it has accepted the principle of international arbitration in the Mahakali Agreement with Nepal and that Nepal has a first claim on the river water. Again, there is realisation that Bangladesh's claims on a larger share of river water is not unjustified. Research has shown a correlation between low dry season water flow causing drought conditions in upstream Bangladesh districts, which also account for very high share of migration to India. A settlement will also benefit India by the prospect of winning rail and road transit facilities through Bangladesh. Similar recognition is needed vis-a-vis Pakistan. The sheer size of our country with its industrial base and military buildup dwarfs Pakistan and therefore reduces the threat it poses to a manageable dimension. Indeed, failure to solve disputes with neighbours and inability to solve democratically internal conflicts have diverted resources and sapped the energy of our people. Were the GOI to change its approach, its credibility in the region will improve and result in expansion of economic relations, whereas right now it is a spectator which tries to make ineffectual gestures from the sidelines.

Kashmir: Self-determination, Communalism and Democratic Rights

K Balagopal

About 25,000 people, by official count, have been killed in Kashmir in the last six years, about two-thirds of them by the Indian armed forces. Kashmiris put the number at 50,000. Yet democratic public opinion in India has remained largely silent, except for occasionally expressing disapproval of army atrocities. Is only killing people in a staged cross-fire a human rights violation? Is the denial of the right of self-determination itself not an act of human rights violation?

NOW that cynical realism believes it has won some sort of a victory in Kashmir, it is time to talk of some principles – principles pertaining not only to the way the rulers of India have been dealing with Kashmir, but also the way progressive and democratic-minded Indians have been responding to Kashmir, and to the problems stemming from the mode of expression of the cause of Kashmiri self-determination. Criticism of the rulers is easy and uncomplicated, at least in principle, if one has no material or ideological interests vested in the matter. The others are less easy, less familiar and less comfortable, but unless we learn to formulate such critiques, the cause of progress and democracy will remain stuck at 1989.

India has quite a sizeable section of intellectuals, activists and political movements committed to the democratic cause. 'Democracy', of course, is not an uncomplicated expression, and if the bourgeois version of it is full of problems, then so is the leftist version of it. Indian democrats, movements and activists, for instance, have reacted strongly to quite a few instances of suppression of the democratic aspirations of different sections of the people, as a matter of democratic principle; but they have remained brutally silent – or else exhibited a low-key response – about others. One need not add that there are a few honourable exceptions. The silence is not due to oversight or preoccupation with more urgent matters. That may be excused. The silence, on the contrary, is studied and deliberate. It is quite frequently even theorised. A close analysis of the reasons proffered for the lack of equal enthusiasm to speak up in each of these cases would reveal a lot of unsuspected problems with what is commonly understood as the democratic worldview by those who believe their understanding is untrammelled by bourgeois or other limitations.

DOUBLE STANDARDS

Kashmir is one example. About 25,000 people have been killed in Kashmir in the last six years, by official count, about two-

thirds of them by the Indian armed forces. Kashmiris put the number at 50,000. Western human rights organisations and some Indian civil rights groups have documented army atrocities on the Kashmiris in considerable detail. Kashmiris, for their part, have not only documented their suffering but also argued over and over again their case for the exercise of the right of self-determination. Their arguments are difficult to refute except by resorting to cynical political 'realism', which can be given progressive padding by referring to the US machinations in the south Asia. Yet, the democratic public opinion of India has remained largely silent except to occasionally express disapproval of army atrocities. Kashmiris tirelessly ask every human rights activist they meet whether only getting killed in a staged cross-fire is a human rights violation; and whether the denial of the right of self-determination is not in itself an act of human rights violation. The response from much of democratic public opinion in India is a stony silence.

A prominent leftist intellectual, writing in the columns of this journal, has cautioned those who would defend self-determination in Kashmir to realise that what they are defending is religious self-determination. Others, equally well known for their progressive views, have said that the option of plebiscite cannot be allowed to the Kashmiris because it is likely to be exercised communally. In other words, they will be allowed to choose only if they are not going to choose Pakistan, which choice, if made, is axiomatically believed to be on religious or communal (and it is not clear whether the two are the same) grounds. Nobody has as yet said that elections must no longer be held in Maharashtra because the electorate is exhibiting a tendency to make the communal choice of voting for the BJP and Shiv Sena, but the same argument is believed to be valid in the case of Kashmir. If someone wishes to argue that there is a difference between a choice made within the Indian state and the choice of seceding from the Indian state,

then one would like to hear some argument that would show that the double standards are justified by this difference.

Is Kashmiri self-determination a religious aspiration? Is it the case that it is necessarily classifiable as either religious or secular? Is all that is religious necessarily communal? Is a religious aspiration to be denied even if it is not communal? Assuming that it is communal, is all that is communal necessarily to be banned in order to get rid of it? How far is the idea that the freedom to choose ought to be and can be denied in order to prevent harmful choices valid? It has a certain validity in the case of physically harmful things such as drugs, but how far can one take it in the realm of ideas and identities without making nonsense of the notion of democracy? In general, is the potential for evil human beings best exorcised – or at all exorcised – by depriving them of their right to make free choices? What, anyway, is the source of evil – such as, for instance, communal divisiveness – in human beings, and how are we to ever overcome it?

A comprehensive discussion of these questions is necessary if democratic public opinion in India is ever to complete a self-critical examination of its attitude towards the 'Kashmir problem', and the dubious doctrinal certitudes that underlie it. What can be attempted here is only a preliminary discussion of it.

IS KASHMIRI IDENTITY RELIGIOUS?

What exactly the Kashmiris mean by 'azaadi' may not be easy to determine. Perhaps all of them do not mean the same thing. In any case, there are too many guns around for a frank expression of views. Moreover, a troubled people soon learn to tell whatever the questioner expects from them, a deviousness that their troubled state teaches them. One thing is however clear, that they have a strong sense of their distinct identity, and 'azaadi' is an emotive expression of that distinctness, even if in concrete political terms it means different things to different people, or nothing more specific than a yearning for a free existence for many. Everywhere in Kashmir, though more in urban than in rural areas, the response to any talk of 'azaadi' is spontaneous and enthusiastic, even in the least propitious circumstances.

Most secular-minded persons in India will immediately ask: is this identity religious? One thing can be said without any hesitation: it is certainly not irreligious. If that puts a question mark on our sympathy for that identity, then there is something wrong with our understanding of popular identities. The identity of a people is what they are in their own eyes, the self-image about which they feel strongly, irrespective of how one interprets it in relation to their material existence. And religion is an integral part

of what most people are in their own eyes. Islam, the way Kashmiri Muslims believe it and practise it, is very much a part of the identity that they feel so strongly for. If irreligious or non-religious identities alone deserve support, then no national self-determination movement can ever be supported, because there is no national identity – at least in the third world – that is totally devoid of a religious dimension. Of course, this raises the question whether such a religious identity can guarantee the security and the cultural freedom of minorities, and what assurances will be given in this regard. The Islam that Kashmiris believe in and practise has in the past been on the whole a syncretic and relatively open system of beliefs and attitudes, which has prevented the Islamic element of the Kashmiri identity from becoming a hindrance to a common Kashmiri identity shared with the Hindus. Communal fanaticism has not been a notable characteristic of the Kashmiri mind. Hopefully, the events of the last six years have not made much difference to this, though embittered emigre pandits do say that things have irrevocably changed now. It is perhaps not an insignificant matter that the Sikhs in Kashmir have not left the valley, and do not seem to feel the kind of discomfort that one would expect in the presence of an alien fundamentalism. How much of the pandits' views is born of distrust, which no doubt finds evidence in the actions of the Pakistan-backed fundamentalist elements in Kashmir, and how much is a realistic appreciation of actual change in the attitudes of the average Kashmiri Muslim is a matter of doubt. There is certainly plenty of hostility towards India in Kashmir, but little hatred of Hindus as such. And even as regards the hostility towards India, one hears people say with surprising regularity that what they hate is India and not Indians. That they feel impelled to express this clarification is perhaps a tribute to their pride in their tolerant and friendly culture.

But the question whether Kashmiri self-determination is religious self-determination seeks specifically to know whether the Kashmiri desire to exercise the right of self-determination harks back to the two-nation theory: that, being mostly Muslims, they must join Pakistan. Whether such a desire must necessarily be branded communal is a legitimate counter-query. And whether – be it communal or not – it is to be met by suppressing the desire of self-determination is another legitimate counter-query. There are certainly some in Kashmir who frankly believe in the two-nation theory as a political faith. The Jamaat-e-Islami of Kashmir holds the view that as a Muslim majority region, Kashmir must be in Pakistan; and so do most of the other (smaller) Islamic organisations. There are even a few who believe in pan-Islamism as an ideology. However, it is worth mentioning the views of People's League leader Shabir Ahmed Shah; one of

the most respected of the Hurriyat Conference leaders, a cultured and soft spoken man who has a rare concern for ethical propriety in politics. He makes a distinction between what he calls religious fundamentalism (hatred or denigration of other religions), which in his view is wrong, and political fundamentalism (by which he means the inseparability of religion and politics), which in his view is not wrong. He has gone out of his way to address the pandit refugees in Jammu and ask them to come back to the valley, for Kashmir in his view is incomplete without them. The question whether he has an answer to all the difficulties that are likely to arise from such a viewpoint need not detain us now. What is instructive is the clear distinction he makes, and the vocal concern for tolerance and amity between Hindus and Muslims that he – like many Kashmiris – is able to combine, not as a matter of political tactics, but of genuine conviction, with his unflinching faith in the only Truth.

But by all accounts, it appears that for what may be called the average Kashmiri Muslim, Islam means the humane and tolerant tradition of the religion as interpreted by the Kashmiri sufis, whose influence is symbolised by the ziarats that dot the valley, and is as inseparable from the Kashmiri identity as the latter is inseparable from Islam. As a consequence, pan-Islamism or the two-nation theory, it is said, do not attract the Kashmiris much. How true is this opinion? It is interesting that when the Kashmiris are asked whether liberated Kashmir is likely to be a theocracy or a secular democracy, those who identify with the syncretic and humane tradition answer without hesitation that it will be a secular democracy, whereas the fundamentalists reply in evident doubt that 'it is for the people to decide'. A more interesting test of the belief is the ideology being resorted to by the Indian army's surrogates in Kashmir, the sponsored counter-insurgents, all of them criminal gangs, in their bid to attract legitimacy in the valley. Their proclaimed worldview is the synthetic and tolerant culture of what is being called Kashmiriyat. They evidently profess this ideology, not to attract the pandits who are a minuscule minority, nor Indian public opinion, which is happy with any counter-insurgents, howsoever criminal and howsoever oriented ideologically, but the Kashmiri Muslims. Kuka Parrey alias Jamshed Shirazi, the Shahenshah of these army-led criminals, has repeatedly said that his enmity with Pakistan-supported groups such as the Hizb-ul-Mujahideen is because they are out to destroy the tolerant and humane traditions of Kashmir. It is not known how honestly he believes all this, for as the JKLF leader Yasin Malik points out, this man was a pan-Islamic militant before he turned into an agent of the Indian army, but it is instructive that he professes to do so. It is evidently aimed at the common Kashmiri Muslims, and neither

the Indian state nor the pandits who are interested only in his guns and not his ideology. And yet, any perceived insult to Islam would enrage the Kashmiris and result in violent popular outbursts, such as were seen twice in the past, in 1963-64 and 1973, much before the rise of militancy.

How does one make sense of all this? Does it mean, somebody will ask in exasperation, that when – and if – it comes to choosing, Kashmiris will not choose Pakistan on grounds of religious affinity? Or that they will? How does one understand their choice if they do? And how if they do not? Progressive-minded people are accustomed to two modes of thought. One, stemming from the Marxist tradition, which has a framework of interpretation that is said to provide answers to all basic social questions, and a strategy of class struggle that is said to provide solutions to all basic social problems, at least in principle. But the answers and solutions provided by that tradition to questions concerning religious and ethnic identities, and indeed to all problems other than those concerning economic class struggles, have proved extremely inadequate. And the second, more recent tradition, stemming from what is usually called the post-modern worldview (if a view that will not unequivocally endow the world with any greater reality than that of a mental construct can be graced with that title) in which questions do not call for answers, but an interrogation of the question, usually to discover that it really means something else. Neither of these traditions will really help us answer these questions, though the Marxist tradition is at least capable of being revised and reformulated to provide a useful guide to thought. Hopefully, at least in the coming century, radical thought will get over this empty choice between dubious certitudes and the certitude of only doubt, and learn to seek real answers to the real problems of real human existence.

WILL KASHMIRIS CHOOSE PAKISTAN?

In the meanwhile, what about the question we began with: is Kashmiri self-determination religious self-determination? If it comes to choosing, will they choose Pakistan? It is difficult to know for certain. It is quite possible that if both India and Pakistan honourably guarantee not only the existence but also the peaceful development of Kashmir (for it will be a landlocked country if it comes into being), most Kashmiris will prefer an independent Kashmir. But if that guarantee is not forthcoming, as is quite possible, they may well choose Pakistan, not for reasons only of religious affinity but also because it makes social and economic sense. Kashmir was, prior to partition, linked to the rest of the subcontinent through what is today's Pakistan and not through the Banihal pass. Its commercial and social (not merely religious) links were with today's Pakistan.

To travel by road from the Kashmir valley to Pakistan is easy all the year round, whereas to go to India is a tedious journey that leaves you exhausted by the time you reach Jammu, unless you have the money to fly. And that road too is closed for about three months in the year. This 'atut ang', this inseparable organ of India, is unapproachable from India for a quarter of the calendar year, unless one has the money to fly, and this has been so for the last 50 years for which Kashmir has been a – repeatedly proclaimed – 'atut ang' of India. Such is the shame we bear. And in these days when the market is everything, when development is allegedly only market-driven, does it not make perfect economic sense to choose the country with which communication links are palpably better, that too when the region, like Kashmir, is dependent upon export of apples, dry fruit and handicrafts, and the import of tourists? At least our World Bank-driven intellectuals and the Manmohan admirers among our newspaper columnists must accept that for Kashmiris the choice of Pakistan is the most rational one.

But suppose that Kashmiris want to choose Pakistan on the religious ground that they feel happy and fully satisfied in their identity if they live with their co-religionists, what exactly is objectionable about it? Communalism, in the sense of a hateful attitude towards people of other religions, is bad (though what one does about it is another matter). But what exactly is wrong about empathy with one's co-religionists if it does not entail hatred or disparagement of other religions? It may be said that religious identities inevitably lead to communal hatred. That the possibility is there cannot be denied, but there is nothing inevitable about it, and anyway the same danger is present with linguistic and ethnic identities. But human beings find it difficult to live without identities. It would certainly be nice if people did not have a tendency to gather together in religious, ethnic, linguistic groupings, and lived happily together in the most disparate groups. That is not easy for human beings, and is never going to be easy, though it is both necessary and possible to mitigate feelings of prejudice and hatred born of disparate identities. But if self-determination based upon language or ethnicity is not regarded as bad so long as it is not driven by sectarian hatred of others and makes territorial sense, why should not religious self-determination be acceptable on the same footing? One hopes somebody will give some answer other than that Lenin or Stalin said this or that about 'the nationality question'.

Realpolitik, of course, has an answer, which many (Hindu) leftists in India will not feel ashamed to echo. With the Taliban capturing Kabul and the mullahs of Teheran closing in on deviant women, the danger of Islamic fundamentalism becomes a convenient argument for India and Indians

to deny freedom to the Kashmiris. Even if the Kashmiri Muslims are themselves not communal, it will be said, the successful secession of Kashmir will strengthen – if only in spirit – the forces of Muslim fundamentalism, which it is everybody's duty in today's world to thwart. Poor Kashmiris, therefore, will have to be sacrificed for the noble cause of what we call secularism and what the US calls democracy. But whether anybody likes it or not, and whether the Kashmiris are sacrificed or not, there is a good likelihood that the first half of the next century will belong to Islamic fundamentalism the way the first half of this century belonged to socialist dogmatism. The reign of Islam will in all likelihood get into a crisis faster than that of Marxism-Leninism, for the wisdom of the mulla backed by the gun of the mujahid has far, far fewer answers to the problems of modern human existence than the formulas of Marxism-Leninism. And then, perhaps – unless some new dogma comes up in the meanwhile, which cannot be ruled out, given the human hunger for absolutes – we can all sit down to think out a viable (that is to say, humanly possible) alternative to the mode of life imposed by this monstrosity called corporate capitalism, sans dogmatic and utopian assumptions about absolutely and exclusively true ideas, endlessly perfectible human beings and paradisaical human relations. Why should poor Kashmiris lose in the meanwhile?

Let us get back to two questions raised earlier, and try to discuss them, for they are of importance to progressive theory and practice. One is that Kashmir has seen a very determined militant struggle for 'azaadi' for more than six years with widespread mass support and even sporadic mass participation. And yet nobody is able to say with certainty what exactly the Kashmiris mean when they talk of 'azaadi'. Why is this so? The second is that, assuming that all that has been said above about the Kashmiri ethos is wrong, and that the Kashmiris are driven by rabid fundamentalist hatred of secular/Hindu India to raise the demand for self-determination, as embittered *emigre* pandits say, is the denial of that right in the name of refusing to acknowledge the legitimacy of communalism a justifiable attitude, as many leftists in India seem to think?

ASSESSING 'WHAT PEOPLE THINK'

The first question is pertinent to many more contexts than just Kashmir. How does one gauge 'what the people really think' in the presence of arms? Armed rebellions are raging all over the world, including India. All of them claim to speak in the name of some oppressed section of the people. It is certainly true that there can be no armed upsurge without some degree of support from the people in whose name it speaks. But how deep is the support? To what extent does the rebellion really represent 'the

people's interests' as it claims? How does one get behind the bullets and assess what the alleged real protagonists think about the whole thing?

There is no easy answer to this question, but today it is – and is going to be for a long time to come – a vital question for a democratic attitude towards politics. For armed politics has come to stay. More and more, dissenting politics in the world tends to take to arms, and that creates the problem of understanding what exactly the politics represents. Till now weapons have been seen by radical intellectuals in terms of their efficacy in realising the cherished goal of 'liberation', the one-point terminus of much radical thought. The fact that most intellectuals are struck simultaneously by mortal fear and romantic awe of weapons has made a closer look at armed politics difficult. If we are able to get over the infatuation with the terminal notion of liberation and learn to see progress as a (real, but) much more imperfect and wobbly process, staggered in time and liable to regression, whose ideal summation may be called liberation to satisfy the common human urge for perfection in ideas, then it becomes easy to see armed politics for what it is: a form of politics. And as a form of politics it is liable to be questioned for its democratic content and not just the 'liberative' potential of its aims. What exactly is its relation with the people it claims to represent? How much freedom does it allow those people to direct its activity? What are the mechanisms it has created to ensure that those people can effectively hold it answerable to them? These are today important questions for a democratic understanding of political movements, for the era of peaceful mass movements is rapidly giving way to the era of the rebel's gun, for a variety of reasons, some understandable in the sense that the choice is evidently ineluctable, and some certainly not.

Such questions would not pose a major problem in the case of unarmed movements. When a Medha Patkar or a Sharad Joshi claims to speak on behalf of the evacuees of the Narmada dam or the farmers of Maharashtra, the truth or falsity of the claim is tested easily enough. The people in whose name they claim to speak have no reason to support them or to keep silent if they do not agree with them, and the disagreement will soon be evident. It is different with armed politics. As Abdul Ganil, the voluble professor of the Persian language who officiates as the spokesperson of Kashmir's All-Party Hurriyat Conference likes to say, "when the guns speak, politics becomes silent". More precisely, the politics of those who carry the gun may or may not become silent, but the people in whose name the gun speaks gradually withdraw into silence. It is partly due to the fear of getting caught (literally and figuratively) in the crossfire, if one draws attention to oneself by talking

too much; more particularly, there is the fear of being branded an 'agent' of the other party, by either party. To add to this there is the rather tricky fact (from the point of assessing 'what the people really want') of the very human tendency to find oneself in agreement with those who have power in their hands. All authority thrives upon this weakness, whether it is the authority of the state or the authority of the rebel's gun. When one views authority in this role as an ideology, as something that commands obedience not by virtue of its truth but by virtue of its power, it should be realised that the ideological trait is based upon this very human weakness. (All ideology, incidentally, draws sustenance from some weakness in the human subject, whether individual or collective, whether purely psychological or social-psychological, a fact that is of far-reaching consequence for rethinking radical theories of human existence and progress.) Armed rebellions, therefore, frequently give the impression of greater public acquiescence in their ideas and deeds than would be the case if they were unarmed. It may be asked: how does one judge this when – or to the extent that – the acquiescence is willing and conscious? The argument here is certainly not that there is something that the people 'really' believe in as against what they think they believe. Any such notion can be quite fascist. But the ideology of power that induces acquiescence reveals its presence when its authority takes a beating – as when the armed rebels are driven back – and the people find themselves (it is not the case that this always happens) doubting their past acquiescence. One is then left wondering what exactly the ideas acquiesced in represented when they were apparently widely accepted.

In this situation, to know what the people want, or to ensure that what they want alone is expressed in their name, is not easy. The former is a problem for analysis, but the latter is a problem as well for democratic politics, the problem of ensuring the accountability of 'people's movements' to the people. It is of course true that 'what the people think' is not a stable thing. It changes as their perception of their strength changes. The fact that there is an armed – and therefore powerful – force functioning on their behalf may well affect their perception of what they want. Such a genuine perception of their strength must be distinguished from the ideology of the gun referred to earlier. The distinction is revealed, as said above, when the gun takes a beating, but not before. The problem is that there is no way of knowing the exact extent to which the silent or vocal assent of the people is an indication of the perception of their strength, and not any of the reasons enumerated earlier. But the fact that what the people want is not a static nor an easily determinable thing, is certainly no excuse for allowing anybody with effective weapon power to claim that their power

entitles them to represent the people's aspirations before the world, and to pass off all their deeds as the deeds of the people, taking advantage of the silence that follows armed politics. Practitioners of armed politics frequently resort to such claims, with the added prestige of liberators or mujahids to back them. But their accountability to the people is not something one can leave to their self-discipline, reposing confidence in their commitment as 'liberators' of the 'masses'. Nobody can be trusted so far with power. It is, and must be, a matter of public concern, a matter of concern for the democratic intelligentsia and the human rights movement, which must learn, in these days of armed politics, to be more concerned with the democratic content of political forms of rebel movements than the millennium their weapons promise to bring about. In Kashmir, for instance, one frequently hears the opinion that the outlook of the Kashmiris is more truly represented by the worldview of the militarily badly weakened Jammu and Kashmir Liberation Front (JKLF) than that of the heavily armed Pakistan-backed Hizbul-Mujahideen whose ideologues in the All Party Hurriyat Conference speak confidently in the name of the Kashmiris. If this is true, such a tragic anomaly must itself be as much a matter of concern to democratic-minded analysts and human rights activists as the denial of Kashmiri aspirations by the Indian state. And now we have tragedy turning into farce with the thoroughly unpopular India-backed counter-insurgent gangs claiming from within the bunkers of the Border Security Force that it is they who represent the true voice of the Kashmiris.

FREEDOM AND EVIL

Let us turn to the second question: assuming that a people wish to exercise the right of self-determination on purely communal grounds, is that right then to be denied to them in the interests of progress and democracy? Here the question is not whether freedom is an absolute thing; nothing in this world is or can be absolute. That much the history of the 20th century, the century of grotesque absolutes, teaches us. But the question is: what is the relation between freedom and evil? Is freedom a thing to be necessarily suppressed in order to forestall evil? Or does freedom perhaps have a positive role in overcoming evil? This is a difficult question, but it is likely to be posed again and again as fundamentalism of religious and ethnic varieties sweeps across the world. Progressive-minded persons are likely to be caught on the same side as dictators unless some serious thought is given to the matter.

What is the nature of evil in human social consciousness and behaviour? By evil we here mean oppressive, hateful and other similar traits that set people one against the other. We are not here asking this question with reference to the actions and ideas of those whose position in the social structure

implies and requires such evil. We are asking this about the acceptance of and participation in such evil by others, without which it cannot sustain itself. And about other situations where one cannot point to any dominant vested interests that are served by the evil. Why is it that not only those who have a vested interest in perpetuating a particular form of evil but even the 'common people', as they are usually called, become accomplices in it? And are they always only accomplices and never the originators of evil? In particular, what prevents people from overcoming divisive and hate-filled fundamentalism and reaching out to their fellow-creatures in friendship and love, which obviously benefits everyone excepting only those who profit by dividing the people? Why do people who gain nothing materially from it succumb to it?

All the answers that radical theories have are centred on the externality of the sources of evil in popular consciousness. Evil in people's minds is a consequence of successful hegemonic devices put in motion by the oppressors and internalised by the masses because of the pressures of oppression and deprivation; or else it is a skewed perception of reality caused by conditions of oppression and privation. A more sophisticated explanation is that the presence of multiple hierarchies at all levels of society makes possible the reproduction, at all levels, of the divisive and oppressive ideology of power, which basically serves the interests of the ruling classes.

These explanations contain enough truth to make them seem sufficient to those who do not wish to face more uncomfortable questions. The hegemonic efforts, the people's privations and the multiple hierarchies are all equally external to people's consciousness. They act upon it from outside and corrupt it from outside, which is a comforting idea to hold. But in truth, the human mind is not just an empty receptacle that receives the hegemonic ideas of the rulers, nor a bad reflector that somehow converts its sufferings into hatred for the wrong party taking the cue from the motivated codes built into the ruling culture, nor a copying machine that reproduces in thought the ideology of power that stems from the omnipresent structures of dominance. Even if an idea has its roots in hegemonic manipulation or other external conditions, it becomes possible only if there is something it can catch on to in the structure of the recipients' consciousness. We do not take in ideas from outside. Ideas (including ideology, which is often supposed to originate in the interests of others) are shaped in the process of making sense of our existence in the course of interaction with external reality, a process that involves on the side of the subject the whole of the human personality, which is a dynamically shaped product of the interaction between the complex human psychic structure and external conditions

and influences. Unless this edifice of our psychic structure and the process of formation of the personality and of consciousness provide scope for certain patterns of belief and response, attachment to the ideas (or ideology) is not possible, whatever be the external interests they serve, or the external conditions they originate in, if any. It is not enough, therefore, to have a theory of the material basis – or rather, more properly, the external conditions – of evil in human consciousness and behaviour. It is necessary also to have a theory of its human basis. It is not enough to analyse the external interests served by the evil, or the external conditions that underlie it; nor merely to devise strategies for getting rid of them. It is necessary also to understand the internal potential for complicity with such evil in the structure of the human personality, and the moral conditions in which it can be overcome, or at least subdued. Radical theories have shaped plenty of theoretical tools for looking critically at the structures and processes of oppression, but when it comes to looking critically at the oppressed, the only theoretical tool available is the notion of ideology, whether it originates in the hegemonic manipulations of the rulers, or the privation of the oppressed, or the omnipresent multiplicity of the structures of oppression, or some combination of these.

This very basic gap in radical theory can easily lead to an abdication of the responsibility of theoretical effort, in the name of eschewing 'totalising' thought. If by 'totalising' thought is meant any effort to lay down a finite set of interpretative principles that will explain 'everything', it is certainly to be eschewed. That is impossible, and the dogmatic belief that it is possible will in all likelihood lead to totalitarian politics. But the world is an interconnected totality, whether one likes it or not, and it is the responsibility of theory to make as much sense of it as is realistically possible, if any real progress is to be achieved in human affairs. That attempt must not be called 'totalising' in the pejorative sense. To take in the world only as unconnected bits and pieces is to give up the responsibility of thinking theoretically about progress.

It is not proposed to make any attempt here to fill up this theoretical gap, but if it is clear that the human complicity with or capacity for social evil has roots within, as much as the evil may have roots without, it should also be clear that a self-critical attitude is necessary if evil is to be overcome. A merely critical attitude towards the external conditions of existence is not sufficient. And freedom is an essential precondition for a self-critical attitude towards one's inner potential for the bad. Only a free people will be self-critical. In particular, an unfree people, shackled in the name of their attachment to evil, will never look at the inner roots of their attachment to it, but will use their unfreedom to make a virtue of it. Freedom is a necessary

precondition for self-criticism, though it runs the risk (which will immediately be pointed out) that it does not always guarantee it. It is because evil in the consciousness of people is always seen to have roots exclusively without, that progressive-minded persons are attracted to the seemingly sensible idea that the best way to exorcise evil is to build walls that will keep it away, restrict the freedom to make recourse to it, and work to alter the material conditions that have given rise to it. Or perhaps the reasoning is more cynical: that people, if they are allowed the freedom, will be fatally attracted by evil, and so the only way to prevent their degeneration is to shackle them until the utopian millennium in which everybody is an angel descends upon the earth. But on the contrary, the freedom to critically overcome one's capacity for and complicity with evil (oppressive and hateful values and structures that set one human being above or against another) can be a positive aid to the process by which human beings will attain whatever perfection is possible for them. If complicity with hateful and oppressive ideas is seen to be not something imposed from outside, but as something that grows in the process of interaction between the inside and the outside, then we will realise that freedom and the responsibility that freedom brings with it will alone make possible the self-critical attitude necessary to overcome it. In general, human beings need to fight not only existing structures of oppression, but also their capacity to produce oppressive structures again and again. Not only the oppressive conditions of life, but also their own complicity in the oppression of each other. To deprive them of freedom is to deprive them of the precondition for a responsible attitude towards what they are and what they do.

All this is not meant to set up freedom as one more panacea to replace other cure-alls, but only to point out that in the difficult task of transformation of human existence, freedom is not just a glorious end that is to be realised at the last (which in practice means that it is indefinitely postponed), but is also an instrument that aids the process. The necessity of freedom to fight oppression is of course well recognised, but the necessity of freedom for the fight against oneself too needs to be recognised. What is usually called social transformation is also simultaneously human transformation, which is partly at least human self-transformation, and freedom is a necessary condition for it. This still leaves out a lot of problems and does not answer the difficult question: what exactly is the point at which the freedom of action of religious and ethnic fundamentalists should cease in the interests of human civilisation, but at least it will serve to provide an understanding that will distinguish progressive-minded people from dictators when both of them claim to worry equally about the misuse of freedom by fundamentalists.

We can turn at the end to less controversial matters, which are yet matters that have not attracted sufficient response. This is what the Indian state is doing in Kashmir in its effort to bring the Kashmiris to their knees (or their 'senses', as our newspapers say euphemistically). Many will already put this in the past tense, perhaps. By hook or crook Kashmiris, it is already being said, have been subdued and 'brought to their senses'. The swearing in of the Farooq Abdullah government is seen as the turning point.

What will happen in the future cannot be said with certainty. The insurgency will no doubt go on for a long time. Comparisons with Punjab are self-deluding, for the feeling for 'azaadi' is much deeper in Kashmir. The continuance of the insurgency will no doubt be blamed on Pakistan by most Indians, and certainly by our rulers. Pakistan's interest in keeping Kashmir burning is no secret. Its interest is without doubt as mala fide as is India's interest in Kashmir: territory, security, national ego, and everything else except what the Kashmiris desire. But if and to the extent that insurgency keeps raging, the main reason is going to be not Pakistan, but the Kashmiris themselves. The statement repeatedly made by India's politicians and columnists, that the Kashmiris are tired of militancy, is a half-truth. They are sick of the endless sacrifice of lives and blood. They are sick of the seemingly hopeless situation in which they are caught. They are convinced that they are only pawns in a larger battle being fought by the world of Nation States, in which their desire has the least priority for everyone. They had hoped that either Pakistan or the west or the UN would help them achieve their goal: the simple opportunity to decide how they would like to live. But now they are convinced that all these powers are interested in something else. They were half hoping that India, which always speaks in terms of the values of justice and equality, would not be able to stand up to the pressure of the sheer logic of their case and the justice of their arguments. But now they know that India has very brutal answers in its arsenal to all their pleas of justice, and all the impeccable logic of their arguments. Kashmiris may be sick of militancy, but they are much more sick of this betrayal, betrayal of principles by India and betrayal of faith by the other countries. And what they are not sick of is their hope to be free some day.

What we, as Indians, should be engaged in is not the familiar amoral game of political stargazing: what Pakistan will do, what the US will not do, what Farooq Abdullah will achieve, and what New Delhi will not allow to be achieved, etc. We should be more properly concerned with the brutal way in which the present state of affairs has been brought about in Kashmir, if we are, that is, concerned about democracy and democratic

values as our first priority, and are principled enough not to hedge our concern with tactical 'realism', or the kind of opportunism that calls in its aid considerations of 'larger historical issues' or 'the global political context'.

Very brutal suppression, of course, is the answer, and there is no need to recount the numerous instances of fake 'cross-fire' killings or mass massacres of the people by India's brave jawans. But what needs to be explicitly mentioned is the latest and the most cynically efficacious means employed by the Indian state in Kashmir, as part of its 'game plan' (a Kashmiri Congressman's words) to get through with the elections and install an administration of Kashmiris in Srinagar, to show the world that 'normalcy' has returned to the valley. The replacement of General Krishna Rao's administration by an elected Kashmiri government was to be made possible by the augmentation of India's armed forces by armed Kashmiri surrogates: not a statutorily established force of Kashmiri policemen, but unlawful gangs of armed Kashmiri youth, sheltered in or around the ubiquitous bunkers of the armed forces, doing their job of abduction, torture and killing, but only more efficaciously, more knowledgeably and more anonymously, and looting and raping Kashmir withal. Unlike the armed forces, which stay – and need to stay – separate from the local society, and operate in unwieldy and visible groups, these local substitutes can (ideally) live within the local society and act as anonymous individuals. The ideal, of course, is spoilt somewhat by the fact that when they are, as in Kashmir, almost unanimously detested by the public – even by many men of the Congress and National Conference – they cannot live and operate too far away from their uniformed protectors, but nevertheless the advantage of operating through unlicensed local gangs is not slight. More than the physical and logistic advantage is the moral advantage: if Kashmiris kill Kashmiris, some in favour of Pakistan and some in favour of India, then what can poor General Krishna Rao's administration do? Or the army hordes in Srinagar's Badamibagh, for that matter? But what they should not be doing, and are evidently only too plainly doing, is to protect, arm and patronise one gang against another, and openly abet their crimes in the interests of the Indian state and its strategy of not allowing the cession of the prized 'atut ang' at any cost. Nobody in Kashmir makes a secret of the fact that it is this 'game plan' that has made possible the terrorisation of Kashmiri society to an extent sufficient to sap the resolve of the Kashmiris and hold elections successfully.

"This Kuka Parrey's gang are of course a bunch of criminals, but you just watch, it is they who will make elections possible in the valley": this gleeful comment of an understandably bitter pundit on his occasional visit from Jammu back to his half-blown-

up home in Srinagar, just before parliament polls, is plain truth. One of the gang leaders, a colourful character called Papa Kishtwari alias Ghulam Mohammed Lone, put it with embarrassing Innocence when he said to a visiting human rights activist that "it is my gun that will make democracy possible in Kashmir".

To privatise an insurgency by introducing protected surrogate criminal gangs is of course not an idea invented by India's home ministry. 'It is done everywhere', Indians are quick to explain in justification, and usually add (as if they have discovered the piece of wisdom) that 'all is fair in war'. Even some Kashmiris, the kind who are fair even to the enemy, say the same thing, though in tones of frustration and not glee: 'It is done everywhere, and we cannot blame India alone'. Of course it is done everywhere. But presumably, we wish that it should not be done anywhere. If it is unpardonable to militarise a society in the name of tackling an insurgency, then it is unpardonable a hundred-fold to criminalise it.

But a criticism of the rulers that is not accompanied by self-criticism of the rebels is of no use. Where the rebels are not prepared for self-criticism, the criticism will have to come from outside. It is no secret that the Indian Army's Rashtriya Rifles, the counter-insurgency wing that is described by Ghulam Mohammed Magami, the Congress MP from Srinagar, as a "gang of ruffians", which is the premier agency for the recruitment of the Kashmiri counter-insurgent gangs, has found sufficient material to work on precisely because of the methods of operation adopted by the militant groups, and the problems stemming therefrom. The recruits are almost all criminalised former militants of the various groups, or victims or kith and kin of victims of the vengeful acts of violence indulged in by the militant groups. Quite a few are gangs of former militants who have turned to the Indian army for protection, having lost out to a rival group in violent battles for supremacy. It is unlikely that Kashmiris are unaware of the roots that counter-insurgent criminality has in the very methods of operation adopted by the mujahideen. But it is part of the silence that accompanies weapons – added perhaps to a misplaced loyalty that does not allow public criticism of the liberators – that nobody in Kashmir is willing to locate these uncomfortable sources. The Hurriyat Conference leaders, otherwise intelligent and rational men, maintain stonily that all the recruits to what in Kashmir are called the renegade gangs were Intelligence plants within the militant movement from the very beginning, and there is therefore no question of criminalisation of militancy to be addressed when complaining about the criminalisation of the state's counter-insurgency strategies. This is, of course, a hopeless abdication of the responsibility to think self-critically.

But then that brings us to the responsibility of Indians, at least those who claim to speak on behalf of humanity and justice, to think self-critically about our own silence in the face of the government's criminality. Forgetting for the moment what is the proper democratic attitude towards the Kashmir issue, the counter-insurgency tactics being adopted by India's rulers should, as a matter of principle, cause serious disquiet. Physical suppression supplemented by manipulation with the help of local opportunists has always been the government of India's only response to the militant separatist struggles in the border states, but the tactics of sponsoring private pro-India gangs of armed local youth is something qualitatively worse. It creates an atmosphere of terror that is palpably more intense than that induced by state lawlessness. The Indian government has been doing this systematically for the past few years in all the border states. In the north-east it has made use of ethnic divisions to evil effect. That the insurgents of the north-east have frequently provided scope for this is a different matter. Everywhere the state has dangled the temptation of safe crime to attract local youth to its counter-insurgency tactics. And there is enough criminality in any human society for these wretched tactics to succeed. The state's pact with them is that so long as they do the required job of attacking the partisans of secession, armed or unarmed, the gun-wielding militants or the intelligentsia, or even human rights activists such as the late Parag Kumar Das of Assam or Jalil Ahmed Andrabi of Kashmir, they are free to indulge in rape, loot and extortion for their private profit. They can wreak vengeance on their personal enemies, maim them or kill them. It does not require much imagination to realise that such state-sponsored armed gangs can soon degenerate into warlords above and beyond the reach of the law. There cannot be a more vicious abuse of the basic norms of lawful governance than this wanton criminalisation of society. To do this to a people merely because they have asked for the right to leave this country is an act of base cruelty. Suppression by the military is a palpable degree less vicious. It injures the people physically but does not destroy the ethical integrity of their society. Small wonder that sensitive Kashmiris declare now that they hate India much more today than they ever did in the past, even in the past six years of reckless violence of the Indian armed forces.

Will all of us speak up at least now and protect a basic principle of democratic governance from further degeneration? Or are we content to let the Kashmiris, Nagas and other people similarly situated hate us for what our rulers have done and are doing to them, satisfied that in the interests of secularism and opposition to US hegemony, their dreams of what they call freedom and what we call secession are being effectively contained?

Political Theories and Social Reconstruction: A Critical Survey of the Literature on India by Thomas Pantham; Sage, New Delhi, 1995; pp 230, Rs 265.

SOME 50 years ago India formally embarked onto the task of defining and building a just society within the parameters of the nation-state. The Constitution was both a starting point and a basis for this exercise. Ever since, different aspects of this exercise – including this basis – have been repeatedly examined. As a result, the theorisation about our past and the present has occupied a central position in political theory. Broadly speaking, three sets of people have participated in this exercise: political actors, non-academic observers and professional social scientists. The role of professional social scientists has been largely peripheral in setting the terms of political discourse. Nonetheless, a growing number of the academic community finds it essential both to relate itself intellectually to the complex social-political processes in the country and to theorise about these processes with a view to formulating alternative images of our collective self.

This has generated considerable literature which belongs to 'political theory'. The book under review has undertaken a survey of works that broadly fall into the area of political theory. The main focus of this book is on the literature published between 1971-92. The time-frame results from the fact that this work is the product of a survey of research undertaken by Pantham for the ICSSR. However, the author has briefly reviewed the state of political theory prior to 1971 and has also covered works not falling in the time-frame whenever clarity and continuity so dictated.

Pantham was assigned the survey of research on the theme, 'Models and Strategies of Change: Problems of Value, Order and Change'. This, then, is not a survey of works on 'political theory' in general. After initial upsurge in behavioural research in the 1960s, the later decades have witnessed renewed interest in theory. Pantham has chosen a specific area of studies in theory: theorisations of Indian social-political reality. While, thus, the scope of the present work is limited in terms of the time-frame and the frame of reference of the theorisation, Pantham has not restricted the review only to works of political scientists. Instead, the present study has reviewed works of economists and historians as well. This

strategy has proved to be useful in opening up a broad canvass of theorisations. Incidentally, inclusion of other disciplines also points to the relative limitations of political science although Pantham has generously avoided commenting on this aspect.

The book discusses different approaches to the theorisation of Indian politics. These include the liberal democratic, Marxian, Gandhian and Hindutva approaches. Besides, Pantham has devoted a separate chapter to discuss the formulations of V R Mehta and Rajani Kothari. On the whole, the book adopts the strategy of reporting major works belonging to each of these approaches along with a summary of main criticisms levelled against the same. Only on occasions, Pantham has chosen to add his own critical comments. However, references to his earlier writings help in clarifying his position on various issues under discussion.

NEHRUVIAN MODEL

Nehru's socialist rhetoric coupled with emphasis on modernisation and mixed economy has attracted considerable attention from scholars. Of late, Nehruvian model has come under criticism from many quarters: the supporters of alternative development as well as the protagonists of liberalisation. The Nehruvian model was firmly entrenched in the Indian Constitution which itself is seen as part of the liberal democratic discourse. However, any critique of Indian Constitution has to take into account two factors: (a) the Indian Constitution visualises a democratic and independent nation-state in the background of imperialism and in the context of neo-imperialism; and (b) the liberal democratic ideology of the Indian Constitution produces space for the democratic struggles for people's rights. In fact, the civil liberties movement in the country could survive mainly because of the availability of the liberal democratic instrument in the form of the Indian Constitution.

Such a contextualisation of the Indian Constitution can help in developing a sound critique of the Nehruvian model. In the global context of neo-imperialism in the post-second world war period, protecting the Independence of nation-state was an

important task. Nehru devoted the energies of the newly born independent state to this task. He did this not only by way of a political rhetoric but through the idiom of 'modernisation'. Also, the Nehruvian model adopted a non-authoritarian and welfarist strategy. This provided ideological space for democratic struggles as well as for socialist struggles. In other words, Nehru model combined the strengthening of a capitalist state apparatus and keeping alive the project of socialist democracy. Much of the recent enthusiasm in debunking the Nehru model seems to be missing this 'paradoxical' nature of the Nehruvian model which has been captured by Sudipta Kaviraj. Pantham appears to be in general agreement with Kaviraj (p 32); he goes a step further and argues that Nehru 'strove to institutionalise' a democratic-socialist state (p 33). This assessment goes against the fact that capitalism grew under the aegis of the Indian state not only after Nehru but during Nehru's time also.

Following Bhiku Parikh, Pantham has argued that the Indian state is a combination of communitarian moralities and liberal democracy. Noting that this aspect has almost completely missed the attention of scholars, Pantham has recommended that this combination needs to be studied in greater detail (pp 171-72). Although Parikh and Pantham appear to be endorsing the communitarian morality, such endorsement needs to be considered in the context of following factors: (i) communitarian morality implies autonomy of communities *vis-a-vis* each other and *vis-a-vis* the nation-state. Thus, communitarian morality, apart from generating questions of identity, leads to justification of an insular existence of communities. (ii) Secondly, the logic of communitarian morality extends justification to the Hindutva discourse where claims of existence of a mega-community form the basis of communalist politics. (iii) And thirdly, communitarian morality may also strengthen the hold of castes over the individuals. It is precisely for these reasons that Ambedkar turned to the 'liberal' logic with a view to breaking the hold of communities over the individual. This concern prompted him to ultimately extend support to a predominantly 'liberal' constitutional instrument.

Pantham has also summarised the works revolving around the role and nature of Indian state. Notable in this regard are the arguments of Rudolph and Rudolph and Atul Kohli (pp 49-55). Although the Rudolphs talk in terms of 'political economy', they are mainly concerned with

the politics of economic development. The state-centred approach of Rudolph and Rudolph characterises Indian politics as non-class, centrist politics and while they suggest that state is the source of 'exploitation and injustice', their approach does not recognise the class-caste character of the Indian state. Kohli, too, is not comfortable with the Marxist approach as it fails to grasp the politics of change. Kohli's emphasis on 'institutionalisation' makes him a supporter of state-autonomy. However, he believes that an autonomous, partially insulated state would, then, engage in reformist intervention. Whether 'partial insulation of state from society' would accentuate domination of entrenched classes over the state remains unanswered in Kohli's scheme. This problem arises due to two factors: (i) an overarching concern with 'order' and governability, and (ii) a scepticism about mobilisation of various social groups ('merely for securing access to state resources').

A richer and more complex set of theorisation has emanated from scholars belonging to various strands of Marxism. Both the richness and complexity stem from the attempt to understand nature of the Indian state on the one hand and to provide theoretical links between India's capitalist development and politics of the dominant classes. Pantham has summarised arguments regarding these issues by a number of economists. But what makes the chapter on Marxist and neo-Marxist theories interesting is a brief summary of neo-Marxist theories in general. This section (pp 63-75) deals with the twin questions of underdevelopment and mode of production in the pre-colonial societies. Among those scholars who have made important departures from orthodox Marxist arguments, Pantham has included Andre Gunder Frank, Wallerstein, Laciau, Emmanuel, Samir Amin, Hamza Alvi and Pranab Bardhan.

Pantham's survey of Marxist theories of Indian politics includes a brief section on the question of transition to socialism. Following the argument of K N Raj regarding 'intermediate regime', Pantham puts forth the thesis that (a) the dominant classes depend on support from 'intermediate' classes, and (b) these intermediate classes "can still try to usher in a mass-based polity" (p 78). There have been very few systematic studies on the political inclinations of the intermediate classes. It has been argued that sections of 'intermediate classes' have become partners in the ruling alliance and Pantham himself accepts that the intermediate classes have, since independence, supported the dominant classes (p 77). In fact, the intermediate classes not only support but perform a legitimising-hegemonising role for the

dominant classes. This leaves very little room for optimism as far as the role of a whole range of middle classes is concerned.

Pantham finds particular merit in the work of Arun Bose (*India's Social Crisis: An Essay on Capitalism, Socialism, Individualism and Indian Civilisation*, 1989). He concurs with Kviraj that Bose's analysis opens up new possibilities for understanding Indian social reality in a Marxist perspective. Bose takes into account the nation-specific cultural specificities as legitimate aspects of the global capitalist system. This allows Bose to turn attention to the specificity in Indian society, viz, caste. Bose attempts to integrate political economy with Dumont's theory. This opens up the possibility of understanding the specific nature of India's dominant classes. The question of domination has to be understood in the context of hierarchical caste structure of Indian society. Pantham believes that through a critique of Bose's argument, it is possible to arrive at fresh formulations of class/caste domination and new paradigms of civil society/state interaction in the Indian context (pp 177-78).

Probably the most important development within Marxist theory has been the formulation of 'subaltern studies'. However, this school has had only a moderate impact on studies belonging to the formal discipline of political science. In view of this, Pantham has chosen to give a detailed summary of the main formulations and criticisms of subaltern studies. This includes the works of Partha Chatterjee, Ranjit Guha and Gayatri Chakravorty Spivak and critical commentaries by Dipankar Gupta, Rosalind O'hannon and Mridula Mukherjee (pp 82-100). The emergence of the subaltern school has given rise to two major debates which, if continued, will undeniably enrich political theory in India. Firstly, the nature of India's freedom struggle has been debated with renewed vigour. The validity of the 'nation-state' representing the entire political arena has now been challenged. Scholars belonging to the subaltern school have raised questions about the class character of the national movement.

On the other hand, they have also questioned the role of the Gandhian movement in Indian politics. Gandhi is seen as perpetrator of the 'passive revolution'. In fact, this assessment of Gandhi originates in the subaltern understanding of the nationalist struggle as arrogating subaltern aspirations and subsuming them under the discourse of the 'nation-state'. While the subaltern studies have made an important contribution by trying to integrate Gramscian ideas into their thinking, Pantham has been particularly critical of the essentialising tendency and a 'negative assessment' of Gandhi. Failure to

creatively understand the Gandhian project has, indeed, been a major limitation of the subaltern studies. Pantham underscores the need for a 'critical-creative' interrelation between Marxian and Gandhian concerns (p 179) in order to avoid 'mere substitution...within the same sign-system' (p 101).

Gandhian thought, thus, provides the basis for debate over the role and nature of class-politics, the critique of capitalism and interaction between social reconstruction and tradition. Gandhi's discourse correctly understood the link between imperialism and the capitalist frame of values. Therefore, it tries to bring together the two types of struggles – the swarajist (anti-imperialist) and the sarvodaya (social reconstructionist) struggles. This led Gandhi to speak in terms of the 'people' instead of classes. Also, Gandhi was concerned not only with the material contradictions in civil society but moral contradictions (in terms of public/private), too. The main impediment, however, in creatively confronting the Gandhian moment, has been Gandhi's position *vis-a-vis* tradition. Liberals and Marxists alike have been uncomfortable with Gandhi on this score. Gandhi has either been branded as a traditionalist, supporting 'peasant-communal moralism' or hailed as a post-modernist.

In this context, the present volume summarises the works of Parikh, Pantham and Ashis Nandy. Nandy has argued that Gandhi was a critical-traditionalist in that he claimed to uphold traditions but simultaneously was prepared to reject traditions. Gandhi was also not averse to incorporating elements of modernity. In his own works, spanning almost a decade between 1983 and 1992, Pantham has been arguing that Gandhi's thinking goes beyond liberal-utilitarian framework; Gandhi's satyagraha extends the principle of morality to the public/political domain and Gandhi attempted to go beyond dichotomisation between the self and other. Pantham's preoccupation with situating Gandhi in Habermasian discourse on the one hand and in post-relativist framework on the other somewhat obscures critical/emancipatory context of the Gandhian discourse.

In the background of liberal, Marxian and Gandhian theorisations of Indian politics, Pantham reviews the contributions of V R Mehta and Rajani Kothari. Mehta seems to take inspiration mainly from Gandhi while elaborating the argument of Integral Pluralism. However, Pantham notes that Mehta's 'modified version' of Gandhism is not free from orthodox western liberal-democratic framework (pp 149-50 and 182-83). Also, in spite of being inspired by Gandhi, Mehta's integral pluralism does not

grapple with the issues of social action for transformation and capitalist social relations. Rajani Kothari's writings, both in the pre-emergency period and later works, have been extensively summarised by Pantham along with major criticisms of Kothari's works (pp 150-67 and 184-86). It is noted that Kothari's early writings employ the modernisation framework. He was among the few political scientists who appreciated the two-way interaction between modernity and tradition. Kothari also sympathetically evaluated the consensual Congress system during the Nehru era. This evaluation stemmed from a search for viable national-state model of democratic development and also from Kothari's assessment that political leadership was capable of acting autonomously since it was comparatively free from social-economic elites. This evaluation invited criticisms from Bhambri and Ashok Mitra among others. In the post-emergency period, Kothari shifted the emphasis from democratic development and autonomous political institutions to mass struggles and the issue of decentralisation. He now perceives the development-oriented task of nation-building as violative of plurality and freedom. This has led him to formulate a theoretical framework of 'alternative democracy'. This framework has been faulted by Satyamurthy and Mohanty for a lack of 'proper' class analysis. However, it needs to be emphasised that in Kothari's recent works he proceeds with class analysis of the character of state and state-oriented development and turns to the Gandhian discourse for constructing an 'alternative vision of democracy'. This positioning of his theory allows Kothari to take an anti-capitalist, anti-authoritarian and anti-communalist stand. However, his post-emergency writings have become increasingly sceptical of the nation-state and led him to posit radical potential mainly in the scattered, non-party 'peoples' movements' – a position liable to the charge of romanticisation; both because it implies peoples' movements as authentic representations of popular struggles and aspirations and also because this position holds that such non-party movements can effectively confront the state.

ISSUE OF HINDUTVA

The last two decades have witnessed a rise in Hindu communalist politics and a shrill rhetoric based on Hindutva. The contemporary formulation of Hindutva attempts to integrate the arguments of Golwalkar, Savarkar and Deen Dayal Upadhyay. Pantham has briefly summarised the main arguments of these three ideologues of Hindutva (pp 127-31) before turning to the discussion of contemporary ideology of

Hindutva. He makes mention of Gandhian socialism and the arguments of Swapna Dasgupta. The latter relies mainly on the argument of majoritarianism; just as Girilal Jain did in his last years. The contemporary Hindutva discourse deceives a student of political ideology because it relies on different arguments at different junctures depending upon political expediency. Besides, the contemporary Hindutva discourse has a hidden text of a communal understanding of the self and of our history. This hidden text operates in middle-class drawing rooms and kitchens; constantly breeding suspicion, hatred and a vacuous nationalism. In academia it is represented by projects of rewriting 'our' history, glorifying violence for 'good' cause and espousal of Hindu metaphysics. In view of this nature of Hindutva discourse, Pantham has summarised, at length, the criticisms of contemporary Hindutva ideology (pp 138-45). However, he is aware of more serious issues involved in being able to critique and counter Hindu communalism. These are: meaning and nature of secularism, religiosity, nature of the liberal-secular state; Hindu state and (mis)appropriation of nationalist as well as Gandhian legacy. It will not be sufficient to employ the capitalist logic of 'secularism' alone, for countering Hindutva nor will it suffice to counter communalism merely by upholding the cause of minority. In fact, Hindutva ideologues would be too at ease if a critique of Hindutva is pitched merely within the 'secularist' framework. As Pantham has hinted, a critique of Hindutva and Hindu communalism can squarely base itself in Gandhian ideas.

The present volume, thus, identifies the main locations of theoretical confrontation: liberal, Marxian, Gandhian and Hindutva schools of thought. Since this volume does not deal with abstract theorisations, the theoretical standpoints surveyed in this volume include not only criticisms but emotive polemics, too. Such a survey, by its very nature, is bound to be inconclusive. Pantham has given only a very brief and sketchy outline of strengths and weaknesses of different sets of theorisation. Readers would have benefited immensely if the author had chosen to systematically spell out his assessment of the theorisations of Indian social reality.

From Pantham's observations following issues stand out as major areas of contestation which require the attention of scholars: nature of Indian state, the stage of capitalist development, the issue of the grand narrative of development and the relationship between democracy and popular struggles. The Gandhian, Hindutva and Subaltern schools will doubtless provide ideological vigour to scholarship. But at the same time,

contemporary scholarship has had to take note of Ambedkar's powerful critique of Hindu religion and society. The last two decades have seen insightful and many times controversial studies on thinkers for whom the caste factor provides the foundational paradigm of social analysis. Works on Phuley, Ambedkar as also Periyar have been rightfully claiming a place onto the intellectual map. One wishes that Pantham might have noted this development at least in the concluding chapter; because, this development has made theoretical contestation both, more fierce and more people-oriented. The formulations by Phuley and Ambedkar have brought to the forefront of theory issues of ideology of Hindutva and caste-based domination. It is not sufficient to discover the material basis of caste-exploitation. Caste system survives also because of the justification implied in the notion of caste. Following Phuley-Ambedkar, it is now possible to employ caste-terms ('shudra-dwija'/brahmanic-non-brahmanic) as analytical categories to understand social reality. Also, this school of thinking has made theory more sensitive to the issue of the hegemonising role of tradition. This awareness should help in developing a non-orientalist critique of tradition. Finally, the power-structure in Indian polity can be more meaningfully understood by integrating the valuable insights of Phuley-Ambedkar with the other theories in search of the emancipatory project.

Pantham's survey of Indian political theorisation begins with a discussion of the 'swaraj-sarvodaya discourse of our freedom movement'. Phuley anticipates this discourse with his criticism of the Indian National Congress. Both Phuley and Ambedkar raise the pertinent issue: whose nation – freedom for whom? In this sense, they, rather than Radhakrishnan, become the eminent exponents of 'swaraj-sarvodaya' discourse.

There is one more reason why Phuley-Ambedkar along with Marxist and Gandhian thought need to be brought to the centre stage of political theory. An influential section of theory scholars, for a variety of reasons, appear to be entranced by ideas of anti-foundational, relativist school of thinking. Such thinking appears as counterpoint to capitalist modernity. However, in this thinking there is a tendency to deny the realisation of emancipation through collective action. The discourse of Phuley-Ambedkar, like those of Gandhi and Marx proceeds on the basis of the emancipatory project. Pantham, himself, is aware of the problems involved in relativist versions of theory (pp 120, 175, 184, 188), although he does not elaborate on this point. With their firm belief in the foundational character of moral principles and their search

for emancipation, Phuley-Ambekar's ideas can help in keeping the emancipatory project alive in theoretical exercises.

In the last few pages of this volume, Pantham discusses problems faced by and the role expected of Indian political theorists. Following Kothari and Kaviraj he, too, emphasises that 'original' political theorisation of Indian society "can be found not in the writings of the academic social and political scientists but in the praxiological works of...thinker-leaders of our national/freedom movement" (p 186). While there is no need to contest this fact, it is not necessary to lament it either. 'Moral-political' theorisation of social reconstruction is very unlikely to follow from the exercise of professional academicians. Left to academicians, theory may only become more sophisticated and in the process less concerned with social reconstruction.

Then, what is ailing Indian political theory? A few points may be ungrudgingly conceded. Teaching and research in political theory in India leaves much to be desired. Secondly, in spite of some improvement in the period since 1970, scholarly attention by political scientists to the task of critiquing our thinker-leaders has not been adequate. Thirdly, a genuine dialogue between Indian political theorists and their western counterpart is for the most part lacking. And finally, *a la* Bhiku Parikh, Indian scholars find the double burden of mastering both the western and Indian traditions too heavy to bear. Hence the 'poverty of Indian political theory'.

Or, is there some other burden? Except for occasional or 'orientalist' interest in, say, Gandhi or Hindutva, western political theorists happen to ignore the moral-political theories of Indian thinkers. Acquaintance with Phuley, Periyar or Ambedkar, for the most part, is restricted to 'India specialists' only and not to political theorists in general. As Pantham himself notes, Habermas or Rawls do not take note of the Gandhian discourse. Thus, Indian theorist assumes the 'burden' of educating (convincing?) his western counterpart about the moral-political theorisation that has taken place in India.

At the same time, the western counterpart decides what it means 'to do theory'. As Bhiku Parikh has said, the Indian political theorist 'needs to go west' in order to understand 'what it is to do political theory' – that is the *only way* (Parikh quoted by Pantham, p 192; my emphasis). In this journey to the west, most often, the Indian political theorist loses control over 'what kind of political theory to do'. He does the 'theory' which is the dominant mode of thinking in the west at a given point in time. Incidentally, Gandhi refused to do precisely this. He refused to be drawn irretrievably

into the western discourse. He chose to talk to the Indian people instead. Our contemporary theory seeks western 'audience'; and in the process many times loses track of its main objective, i.e., moral-political theorisation of social reconstruction of our society. Being intelligible to west becomes the prime concern of theory. Can this also be a reason for the 'poverty' of Indian political theory?

Dalit Common Sense against Hindutva

Arun Kumar Patnaik

Contending Identities: Dalits and Secular Politics in Madras Slums by S Anandhi; Indian Social Institute, New Delhi, 1995; pp 63, Rs 40.

THOSE of us interested in the grass roots articulation of the Hindutva ideology, especially among the dalits, women, adivasis and workers will find it very useful to go through the monograph under review. This work specifically deals with the organisation of the dalits into the 'Hindutva' fold and also points out the inherent limits of the assimilation strategy adopted by the Hindu communal forces.

By deploying a range of conceptual tools borrowed from Antonio Gramsci, James Scott, Periyar and the contemporary debates on India's secularism, the author surveys the political and ideological responses of the dalit activists in four Madras slums. She successfully demonstrates how the Hindutva ideology of the Sangh parivar, the parliamentary Dravidian politics of the DMK/AIADMK, etc, even while incorporating the dalits into their hegemonic designs, remain extraneous to the dalit formations.

Anandhi has worked out her monograph in four stages. First, she offers a critique of narratives on secularism in contemporary India. The hegemonic secularism of the Indian state by compromising with the religious identities of the majority or minorities has finally given rise to the idea of majoritarianism which considers the activities of the minorities as essentially separatist and subversive for the nation-state in India today. The Left-liberals endorse modernity uncritically by seeking 'secularism from above' as initiated by the Indian state. The anti-modernists like A Nandy and TN Madan, to name two, end up in idealising the so-called 'tradition' as a means to counter communalism. All such intellectual efforts however fail to recognise "secularism as a contestatory practice which would concretely challenge caste, class and gender oppressions and reconstitute collective and individual identities" (p 4).

Second, the author goes on to locate the failure of the present-day Dravidian politics in Tamil Nadu to establish any organic

relationship with the dalit formations. She identifies two phases in the history of Dravidian politics: the non-parliamentary Self-Respect Movement (SRM) (1928-1949) and the parliamentary cretinism of the DMK/AIADMK (since 1949). During its SRM phase, it was well recognised that "the struggle for freedom was multiple, with porous boundaries, shifting identities and numerous agents of change" (p 23). Periyar denounced not merely brahminical casteism but also non-brahmin casteism (p 25). The unity between the Adi-Dravidas (dalits) and the Dravidas (sudras) was a key concern in order to form "a united front against Hindutva" (p 24). So also, the critique of the caste order must articulate a critique of male domination. Thus, the struggles against multiple structures of domination like caste, Hinduism and male domination must be carried out by a united front of the dalits, sudras and women themselves. But this pluralist vision of struggle and unity was gradually replaced by an atomistic approach of the DMK/AIADMK which are steeped in the parliamentary mode of mass action (p 26). Their atomistic approach privileges the language-based identity as the most crucial issue of struggle and overshadows the plural agenda of the SRM. This approach valorises the Tamil past by glossing over the current contradictions as well as the past conflicts inherent in Tamil history. But, when forced by circumstances, the current Dravidian leadership somehow speaks of religion, it does not however address caste or gender oppressions or vice versa (p 27).

As a result of this atomistic approach of the current Dravidian leadership, the Hindu identity, caste identities and so on remain unproblematised, thus providing a platform for the Hindu communal forces to organise the dalits around religious issues. Third, the author examines the dalit responses to the Hindu communal agenda through a survey of four slums in Madras city. Faced with poverty, unemployment, insecurities in

unskilled employment in the informal sector and the lack of cultural dignity, the dalits "look for new and broader identities that transcend caste" (p 36). Capitalising on their precarious existence, the RSS and Hindu Munnani volunteers, consisting of 10 to 15 brahmin youths, carry out the project of assimilating the dalits into a pan-Hindu identity and cultivate in them hatred against the Muslims. They conduct night schools, bhajan sessions and shakhas for the young dalits. The dalit youths are told that Ambedkar was an RSS activist and are also occasionally offered money to launch hatred campaign against the Muslims. The dalit women are also encouraged to participate in 'public' activities such as the shilanyas puja (p 37). The impact of this Hindu communal agenda is well recounted by a dalit panchayat leader of Anumanthapuram slum, "We were very proud that a brahmin, placed high in the social hierarchy, who treated us as untouchables, has voluntarily come to us to impart knowledge and involve us in various public activities. We felt honoured and obliged to them" (p 38).

The 'Sangh parivar' attempts to systematically break the syncretic religious practices prevalent among the Hindus and Muslims in the slums. In its place, it re-imposes idol worship in public by funding and organising the Vinayaka Chaturthi celebration in the slums. Sometimes, each person is paid Rs 500 and provided with a Vinayaka statue. Idols 'representing' each slum are carried in public procession for immersion. The dalit panchayat leaders are given 'honour' of initiating these processions under the guidance of the Sangh parivar. The dalit collectivity/leadership thus generated is finally fed with rumours to create anti-Muslim riots especially during the immersion processions. The riots are important mechanisms to split the Hindu-Muslim bonds that might exist in economic or cultural spheres. The riots also mark the act of assertion by the dalits as Hindus in the entire process of their communalisation. The riots lock a number of negative stereotypes about Muslims in memories of the dalits who are their main actors, if not directors. A dialectical process of inclusion and exclusion thus sets deeper in the dalit common sense through communal pro-paganda, institution-building and riots directed by the Sangh parivar. On the one hand, the dalits feel integral part of a pan-Hindu identity/honour and, on the other hand, they develop an anti-Muslim consciousness. This process of 'filtration' of a communal ideology into the dalit common sense is brilliantly captured by the author (pp 30-43).

However, this monograph's uniqueness lies in the manner in which the author examines dalit common sense and develops,

on its basis, a critique of the caste-based Hindutva agenda in the final chapters (pp 44-60). She explores how the dalits are pulled by contradictions in different directions. On the one hand, they may feel honoured by Hindutva's strategy to assimilate them. On the other hand, they realise that the Hindutva agenda ignores a critique of the caste order which is chiefly responsible for their degraded existence. Driven by such contradictory pulls, some dalit leaders who were earlier co-opted by the Hindu communal forces have now begun to re-think their pro-Hindutva stances. A dalit leader recounts that the dalits are 'pawns' in the pan-Hindu agenda against Muslims with whom they have rather a few things in common such as 'beef-eating' (p 46). Many dalit activists view the Hindutva agenda as an upper caste game plan against the poor cutting across the religious boundaries, as the Muslims are generally seen as poor as the Adi-Dravidas (p 49). Thus, the dalit common sense against the caste social order provides a significant antidote to the expansion of the Hindutva forces. Dalits recognise that 'poverty' cuts across religious boundaries. They recognise that caste/brahminism is one of the root causes of the degraded existence of the dalits. As a result, they show an urge for solidarity with the poor Muslims (p 52). In dalit praxis, one also discerns a formation of a democratic social order, an urge for unity with the oppressed communities. The author succinctly shows how these progressive elements present in dalit common sense could provide alternatives for reorganising India's polity fractured by the hegemonic secularism of a strong nation-state on the one hand and an ever homogenising agenda of the Hindutva forces on the other hand.

The present monograph, in my view, stands apart from earlier works on Hindutva's mass mobilisation programme such as the ones by Tanika Sarkar ('Women as Communal Subject', *Economic and Political Weekly*, August 31, 1991), Tapan Basu and others (*Khaki Shorts and Saffron Flags*, 1993) and Gyan Landey ('Hindus and Others', *Economic and Political Weekly*, December 28, 1991). The latter works offer a voluntarist critique of Hindutva as their critique is devoid of a basis in the subaltern common sense. These works smack of the Frankfurt Left's critique of western fascism. They argue that Hindutva forces succeed in assimilating the subaltern classes/communities by transplanting the Hindutva ideology in the common sense of the subalterns just as western fascism gained ascendancy by conquering the mass psychology. Such a one-sided analysis of subaltern consciousness/praxis fails to recognise the simple fact that if the subalterns (or a section) are already fully co-opted within the Hindutva fold, then our critique of Hindutva turns out to be a self-defeated enterprise because our presumed agency(ies) is not with us. Moreover, such a formulation also begs a question: where do ideas for a counter-hegemony programme come from?

Anandhi's monograph is illuminating for those who are disturbed by the above implications and questions that follow any voluntarist attack on a hegemony system. She locates 'resources of hope' in the positive elements of an otherwise contradictory praxis of the subalterns themselves, and suggests that everything is not lost for new democracy insofar as dalits and the dalit women are concerned despite the homogenising designs of Hindutva forces.

This book provides an insightful understanding about the multivarious factors associated with dairy farming under tropical conditions involving different farming systems located under varied agro-ecological conditions.

Manufacturing Productivity Growth

Method and Measurement

J Mohan Rao

Work on productivity measurement in Indian industry has left unaddressed several critical issues of method and the correspondence between theoretical measures and the indicators used to measure them. Before issues of interpretation are engaged, these methodological issues need to be clarified and, where possible, the measures recast.

The critical issues fall into four broad areas: (1) the method of growth accounting at the aggregate manufacturing (or any other) level; (2) biases imposed by particular methods of aggregation; (3) the econometric identifiability of the production function (at any level of aggregation); and (4) the interpretation of measured productivity growth.

The first and third issues are addressed in this paper for the organised sector of Indian manufacturing. Problems of aggregation and interpretation will be taken up separately in a companion article.

I Introduction

ANALYSES of India's industrial performance, particularly for the period since the crisis of the mid-1960s, appear to have proceeded on two virtually parallel theoretical tracks. One approach has been to focus on supply side constraints, particularly those originating in the trade and industrial policy regimes and, to a lesser extent, public investment in infrastructure. The second approach has tended to emphasise demand constraints, relating these in turn to agricultural performance and/or shifts in income distribution, while also addressing sectoral disproportionalities within industry, including those arising from infrastructure bottlenecks. While a good deal of the debate of the past two decades has been framed in terms of an assumed opposition between these approaches, it is certainly possible to combine important elements of both in a complementary fashion.¹

The purpose of this paper is not to reopen that debate, at least not in any direct fashion. Its focus is rather on a particular method of empirically measuring industrial performance that has acquired some prominence in recent years [see especially Ahluwalia 1991 and Goldar 1986]. The approach relies on an accounting decomposition or an econometrically estimated decomposition of the sources of growth. The results in the Indian case, particularly those due to Ahluwalia's extensive study of manufacturing at both aggregated and disaggregated levels, have been taken by some to be 'proof' of the deleterious effects of the industrial policy regime through the 1970s and the beneficial effects of policy liberalisation starting around 1980. Although neoclassically inspired and aiming to buttress a neoclassical position on the determinants of growth, the approach nonetheless provides a potentially valuable,

empirical starting point for understanding performance. Acceptance of this starting point requires nothing more than approval of a production function-based characterisation of production possibilities, not an especially neoclassical theoretical position.² It is an altogether different matter that this starting point may well lead to diverse substantive conclusions depending on the theoretical frame within which it is interpreted (in conjunction with other empirical relationships).

However, the work on productivity measurement by Ahluwalia and others before her has left unaddressed several critical issues, of method and the correspondence between theoretical measures and the indicators used to measure them. Before issues of interpretation are engaged, these methodological issues need to be clarified and, where possible, the measures recast. The most important of these relates to the question of the proper deflation of value added—a question first raised in an excellent paper by Balakrishnan and Pushpangadan (1994). These authors (hereafter B-P) argued in favour of the separate deflation of the output and material input components of value added by their respective price indices and against the use of a common output price deflator which Ahluwalia and others had employed. Their computations showed that this procedural modification was critical enough that Ahluwalia's conclusion of a 'turnaround' in productivity growth was reversed.

This study broadens the critique initiated by B-P and, within the limitations of available data, demonstrates the empirical relevance of each revision proposed. The critical issues fall into four broad areas: (1) the method of growth accounting at the aggregate manufacturing (or any other) level; (2) biases imposed by particular methods of aggregation; (3) the econometric identifiability of the production function (at any level of aggregation); and

(4) the interpretation of measured productivity growth. The first and third issues are addressed in this paper for the organised sector of Indian manufacturing. Problems of aggregation and interpretation will be taken up separately in a companion article.

The paper is organised as follows: Section II asks whether productivity should be based on a measure of 'physical' output or on a measure of value added in production. The question is closely allied to the aforementioned contribution of B-P. We argue that the alternative deflation procedure due to B-P is also potentially susceptible to bias but can be replaced by an exact procedure that avoids any bias. So long as separability of material inputs from value adding final factors in the production function is hypothesised, productivity may be based on either output or value added measures of production. This recognition leads to an exact procedure for deflating value added that avoids biases inherent in both single deflation and double deflation.

Section III develops a correction to the measure of productivity growth conventionally based on the assumption of product market competition when that assumption is untenable. When firms have price-setting power, the direction of bias in the conventional measure is generally indeterminate but can be allowed for by employing information on the applicable competitive cost of (or return to) capital.

In section IV, we reconsider productivity measurement exercises that are based on the econometric estimation of the 'production function'. The principal advantage claimed for estimating production functions over growth accounting in identifying total productivity is that it avoids imposing the assumption of perfect competition in product and factor markets which growth accounting is supposedly obliged to. But the econometric identification of the

FIGURE 1: MATERIALS AND MACHINERY RELATIVE PRICE INDICES
(1970-71 = 100)

production function is itself suspect owing to simultaneity in the determination of input intensities and output levels. Attempts to get around this problem have, to put it mildly, not been successful though success is sometimes claimed on the basis of smuggling perfect competition back in as in the so-called dual approach. Apart from simultaneity, flexible functional forms that minimise a priori restrictions in estimating the production function may not be well-behaved. The data demands in estimating such forms may also compel a reliance on cross-section evidence which, if there is significant heterogeneity in outputs and inputs, can only yield unidentified or mongrel production functions.

Section V sets out the main results from recasting growth accounting based on the procedures laid out in the preceding sections. Relative price trends are first noted and their influence on current-value versus constant-value indices of input intensity (or partial productivity measures) is described. This is followed by a discussion of the various productivity indices obtained, the magnitude and trend differences among them and what they may imply concerning Ahluwalia's hypothesis of a 'turnaround' in industrial performance in the 1980s. The final section underlines the limitations of data, at least in the Indian context, that all studies of growth accounting must confront.

II Total Productivity or Total Factor Productivity?

Partial measures of productivity (of labour or capital, for example) implicitly assume a Leontief technology. Productivity change

overtime is properly reckoned by such partial measures only if equi-proportionate changes in input coefficients are assumed. If such a characterisation of technology and technical change is invalid, then, leaving aside the problem of heterogeneity of inputs such as 'capital' or 'labour', total productivity must be measured on the basis of the concept of a production function admitting input substitutability. But a choice needs to be made between specifying output as gross production or as the 'value added' in production. The former option leads to a notion of total productivity (TP) while the latter gives rise to the widely deployed measure of total factor productivity (TFP). The choice hinges on whether one believes the production function to be separable in material inputs and factor inputs. To be empirically based, the choice requires identification of an engineering or econometric production function, a task which is frequently unimplementable in practice. At any rate, if the production function is not known, then, the choice is basically theoretical and may be difficult to refute empirically.

It might be argued nevertheless that by Occam's principle, TP is the preferred alternative because it entails one less a priori restriction on the production function. TFP measures are secured only by insisting that the production function is separable in material and factor inputs; no such restriction is needed for TP measures. Common sense also would point in the same direction: after all, firms may secure economies by choosing material input levels jointly with factor input levels and separability need hardly apply as a general restriction on

FIGURE 2: INPUT INTENSITY INDICES, MANUFACTURING

their choice sets. Indeed, one might argue that TP is a complete index of productivity because it accounts for material input conversion efficiency besides efficiency in value added. On the other hand, information regarding TFP (if its empirical measurement does not do too much violence to the underlying technological reality) appears to have greater intrinsic value for it is value added that is the final measure of the value of production. With this in view, it seems desirable to measure TFP while recognising the separability restriction underlying it.

Note, however, that with either measure of output, accounting for production growth must impose other a priori restrictions in any case. First, all firms included in the accounting must be assumed to possess the same production possibilities, describable by a well-behaved, constant-return-to-scale production function. Second, firms must produce outputs of undifferentiated quality with inputs of undifferentiated quality. Finally, the nature of shifts in production possibilities over time must also be restricted: the production function must be assumed to be a stable function of relevant inputs and of time which rules out shifts that involve non-smooth jumps of the function over time. In light of these necessary assumptions which cannot be held to be particularly 'realistic', the assumption of separability would not appear

to be a gross additional transgression of realism.

While TFP can be measured only if the separability assumption is maintained, it is also the case that there is an exact relationship between TFP and TP under that assumption. This may (or may not) seem obvious but deriving the relationship throws useful light on the convoluted problem of 'single' versus 'double' deflation. Suppose the production function is given by

$$Q_t = F(L_t, K_t, M_t, t) \quad \dots(1)$$

where L , K and M stand for labour, capital and material inputs respectively, and Q for gross output. Production is assumed to be subject to constant returns to scale in the three inputs. The function F itself is assumed to be stable through time with any shift in the underlying input-output relations being captured as a smooth function of time. Assume also that measures of real output and real inputs can be constructed and that firms maximise profits taking all prices to be beyond their control. Differentiating (1) with respect to time and writing the result in growth form yields:

$$g_Q = \alpha g_L + (1-\alpha-\beta)g_K + \beta g_M + \delta \ln F / \delta t \quad \dots(2)$$

where g_i is the rate of growth of the i th element in the production function, α is the competitive (imputed) share of labour in gross output and β is the competitive

(imputed) share of material input. Although the time subscript has been dropped in equation (2), here and elsewhere below, all elements (including β in particular) in the growth decomposition are, in principle, functions of time. The last term is the residual of output growth not accounted for by the growth of inputs and is termed 'Total Productivity Growth'. Taking a purely supply-side view of output determination, the residual may arise from any change in the production function and is then taken to stand for all sources of productivity improvement (or its opposite). Equation (2) yields an expression for Total Productivity Growth:

$$TPG = g_Q - \alpha g_L - (1-\alpha-\beta)g_K - \beta g_M \quad \dots(3)$$

Note that (3) is a general expression for TPG that holds whether or not the production function F is separable. To derive a similar expression for TFPG, assume that F is separable in the value adding factors L and K and the material input M . Assume also that 'value added' V is produced by L and K according to the following constant-returns function:

$$V_t = G(L_t, K_t, t) \quad \dots(4)$$

As before, given competition and profit maximisation, we can get a decomposition of growth in value added:

$$g_V = s_L g_L + (1-s_L)g_K + \delta \ln G / \delta t \quad \dots(5)$$

where s_L is the competitive (imputed) share of labour in the value added function (4) and the last term, called 'Total Factor Productivity Growth', is the residual of value added growth not picked up by factor accumulation and, in a supply-side approach to production, is taken to stand for all sources of improvement in value added productivity. Equation (5) may be rewritten to yield an expression for Total Factor Productivity Growth:

$$TFPG = g_V - s_L g_L - (1-s_L)g_K \quad \dots(6)$$

The growth decompositions in (6) and (3) are linked by the value added identity which, in current price terms, is given by

$$\pi_t V_t = P_t Q_t - \mu_t M_t \quad \dots(7)$$

where P , π and μ stand for the nominal price of output, value added and materials respectively. Note that π is a notional price, not a market price. If π is otherwise determined, then, real value added is given by

$$V_t = P_t Q_t / \pi_t - \mu_t M_t / \pi_t \quad \dots(8)$$

Differentiating (8) with respect to time and rewriting the result in growth terms gives

$$g_V = \frac{P_t Q_t}{\pi_t V_t} (g_Q) - \frac{\mu_t M_t}{\pi_t V_t} (g_M) + \frac{P_t Q_t}{\pi_t V_t} (g_P - g_\pi) - \frac{\mu_t M_t}{\pi_t V_t} (g_\mu - g_\pi) \quad \dots(9)$$

FIGURE 3: PRODUCTIVITY INDICES, MANUFACTURING

i.e., the growth of real value added is the difference between the growth of output and of material inputs weighted respectively, by the value of output and the value of inputs per unit of (nominal) value added plus the similarly weighted difference between the growth of the price of output and of materials relative to the growth in the price of value added. Recall that π , the price of value added, is unobserved and as yet

undetermined. It is naturally defined so as to set the last two terms in (9) equal to zero at each point in time for this leaves the measure of real value added growth independent of the changing prices of output and inputs relative to the price of value added, i.e., the implicit deflator of value added should be set so as to have a price-neutral measure of value added growth. This yields a rule, determining the

growth of the nominal price of value added, given by

$$g_{\pi} = \frac{P_t Q_t}{\pi_t V_t} g_p - \frac{\mu_t M_t}{\pi_t V_t} g_v$$

The growth in the implicit deflator is the difference between the share-weighted growth of the output price and of the input price, the weights being reckoned with respect to value added. The above rule ensures that there is a time-invariant measure of real value added. Given the definitional equation (7) and the first-order condition that defines β as the imputed share of materials, i.e., $\mu_t M_t = \beta P_t Q_t$, we get the following expressions for the growth of the implicit deflator of value added and of value added itself:

$$g_{\pi} = \frac{g_p}{1-\beta} - \frac{\beta g_v}{1-\beta} \quad \dots(10)$$

and

$$g_v = \frac{g_Q}{1-\beta} - \frac{\beta g_M}{1-\beta} \quad \dots(11)$$

Observe that the price of value added is stationary either if P and μ are unchanging or if $g_p = \beta g_v$, both of which would be fortuitous conditions. Otherwise, the implicit deflator of value added varies over time according to the rule in (10). The growth of real value added, as (11) shows, is obtained by weighting output growth by the factor $1/(1-\beta)$ and material input growth by the factor $\beta/(1-\beta)$. Clearly, g_v is zero if real output growth equals β times real material input growth; if output and input grow at the same rate, real value added grows at that rate as well. Hence, (10) and (11) define the exact deflator of value added and growth rate of value added respectively.

TABLE 2: INPUT INTENSITY AND PRODUCTIVITY INDICES (Manufacturing, 1973-74 - 1992-93)

Year	Mat Inp to Output (Current Prices)	Capital to GVA	Mat Inp to Output (1960-61 Prices)	Capital to GVA (1960-61 Prices)	Labour to GVA	TFP* Index	TFP*(M) Index	TFPDD Index	TFPSD Index	Output Index

Substituting (11) into (6) yields

$$TFPG = \frac{g_Y - \beta g_M}{1 - \beta} - s_L g_L - (1 - s_L) g_K \dots (12)$$

Substituting for $(g_Y - \beta g_M)$ from equation (3) and simplifying gives an expression for TFPG in terms of TPG:

$$TFPG = \frac{TPG}{1 - \beta} + \left(\frac{\alpha}{1 - \beta} - s_L \right) (g_L - g_K) \dots (13)$$

Now α is the imputed share of labour in gross output while s_L is its share in value added. Since $(1 - \beta)$ is the share of value added in output, $(1 - \beta)s_L$ is the share of labour in output and must equal α . It follows that the second term in (13) is zero and we are left with $TFPG = TPG/(1 - \beta)$. TPG can be calculated using (3): while material inputs have to be measured in real terms using an appropriate input price index, this calculation obviously requires no measurement of value added. Yet, if the separability assumption is entertained, then, TFPG can be readily obtained from the formula just stated, i.e., $TFPG = TPG/(1 - \beta)$, and no double or single deflation of current value added is needed.

While this link between TFPG and TPG, given separability in the production function, may seem obvious, it points up problems in the 'double' or 'single' deflation of value added to estimate TFPG. Under double deflation, the values of output and of material inputs are separately deflated by their respective price indices to arrive at a measure of real value added:

$$Q_{RT} = \frac{P_0 Q_t}{P_t/P_0}; M_{RT} = \frac{\mu_0 M_t}{\mu_t/\mu_0} \quad \text{and} \quad V_{RT} = Q_{RT} - M_{RT} = P_0 Q_t - \mu_0 M_t \dots (14)$$

where the subscript R stands for 'real' (output, inputs or value added). Differentiating the last expression for real value added (V_{RT}) with respect to time gives

$$\frac{\delta V_{RT}}{\delta t} = P_0 \frac{\delta Q_t}{\delta t} - \mu_0 \frac{\delta M_t}{\delta t}$$

which may be expressed in growth terms as

$$g_v = \frac{g_Y}{1 - \beta_0} - \frac{\beta_0 g_M}{1 - \beta_0} \dots (15)$$

where $\beta_0 = \mu_0 M_t / P_0 Q_t$, i.e., the share of materials in output, both being evaluated at base prices. Although the double-deflated growth expression in (15) has the same form as the one in (11), β_0 in (15) is derived by valuing output and inputs at some base year prices whereas the valuations in (11) are based on current prices deflated by a time-dependent implicit price of value added. Substituting (15) into (6) and substituting (3) into the result yields the following

expression for TFPG with double deflation:

$$TFPG_{DD} = \frac{TPG}{1 - \beta} - \frac{(\beta - \beta_0)(g_Y - g_M)}{(1 - \beta)(1 - \beta_0)} \dots (16)$$

For any given year, $TFPG_{DD}$ equals $TPG/(1 - \beta)$ either if output and material inputs grow at the same rate in that year or if $\beta = \beta_0$, i.e., if the price of material inputs relative to the price of output in that year is the same as the relative price in the base year. In all other cases, the double-deflated measure of TFPG will be biased in proportion to the deviation of the input-output price relative from the base level. The direction of bias is indeterminate not only because the numerator need not necessarily be negative (it will be positive if, despite a rise in the price of inputs, the material/output ratio rises due to technical change) but also because there is no assurance that β_0 is necessarily less than unity (though β must be less than unity for positive current value added). If β_0 is more than 1, this implies that value added at base prices is actually negative, a possibility that cannot be ruled out.¹ Apart from these possibilities, the double-deflated measure may be 'expected' to be downward biased relative to the true measure.⁴

Analogous reasoning establishes that when current price value added is deflated by the output price index alone (so-called single deflation), the growth in total factor productivity is given by

$$TFPG_{SD} = \frac{TPG}{1 - \beta} - \frac{\beta(g_Y - g_P)}{1 - \beta} \dots (17)$$

Clearly, the bias of the single-deflated measure of TFPG in a given year is inversely related to the *change* in the relative price of material inputs in that year. By contrast, the bias of the double-deflated measure depends on the *level* of the relative price of material inputs in a given year as compared to the base year. Beyond this, no definite claim can be made as to the relative size of the bias of the two indices.

To sum up, if the production function is assumed not to be separable, then, any measurement of TFPG is conceptually ill-founded. In such a case, productivity growth will have to be measured only by TPG which captures all relevant sources of change though not separately of influences raising 'value added' productivity. But if the production function is assumed separable, then, a measure of TFPG can be obtained indirectly

from the measure of TPG. In this case, the measurement of TFPG directly from value added data is unnecessary. Growth accounting can proceed without reference to value added even though total factor productivity is measured together with total productivity. Measuring TFPG with single or double deflation of value added will, in general, lead to a bias (generally downward in the case of double deflation and in inverse relation to the change in the material-output price relative in the case of single deflation). There is no definite basis for choosing between single deflation and double deflation and both are unattractive; but it is not a choice that need be made.

III

Price-Setting in Product Markets

Unlike agricultural sellers for example, sellers of manufactured products rarely operate under textbook conditions of competition. Typically, manufacturing firms set prices using some rule of mark-up over prime costs. Given market demand, the rule will be conditioned by how the mutual interdependence among sellers within the market is managed. Under conditions of uncertainty, concerning the state of demand, the markup rule may not even depend on 'objective' demand parameters.

If such price-setting power prevails, then, it has potentially important implications for the measurement of productivity growth. The growth accounting procedure, with the modification noted above, can be adapted to a monopolistic product market setting also. To set the stage for the formal analysis of these implications, the growth accounting equation (3) may be rewritten as under:

$$TPG = g_Y - \sum_{K,L,M} \epsilon_i g_i \dots (18)$$

The output elasticities $\epsilon_i = (1/Q)(\delta Q/\delta I_i)$, where I_i is the quantity of the *i*th input (factors or material inputs), depend on the parameters of the underlying production function. With profit maximisation under conditions of all-round competition, these output elasticities equal the respective actual input shares; that is to say, $\epsilon_i = s_i = P_i/PQ$ where P_i is the competitive price of the *i*th input.

The equality of output elasticities and actual output shares ceases to hold under conditions of monopoly power because the

TABLE 3: TOTAL FACTOR PRODUCTIVITY GROWTH RATES

Productivity Index	1973-74 - 1980-81		1981-82 - 1992-93		1973-74 - 1992-93	
	Per Cent	t-ratio	Per Cent	t-ratio	Per Cent	t-ratio
TFP*	5.5	3.2	-2.2	-2.8	2.0	3.0
TFPDD	4.6	3.2	(-0.2)	-0.4	2.2	5.3
TFPSD	(-0.2)	-0.2	2.1	5.7	1.3	5.5

Note: Growth rates in parentheses are statistically insignificant at the 5 per cent level.

output decision of the firm affects the output price it secures, say according to the demand function $P = D(Q)$. Assuming strict factor market competition and no uncertainty in demand, rents arising from the exercise of market power will accrue to the residual claimant within the firm. It is reasonable to suppose that that claimant is the profit recipient or 'owner' of the firm, i.e., capital. With this assumption in place, we may write down the optimisation problem facing the firm as follows.

$$\text{Maximise } D(Q)Q(K, L, M) - wL - \mu M - r_c K \quad (18)$$

where w , μ and r_c are the competitive wage, material price and cost of capital respectively (for convenience, we assume that the price of capital goods is unity). The first order conditions are:

$$P \frac{\partial Q}{\partial L_i} + Q \frac{\partial P}{\partial Q} \frac{\partial Q}{\partial L_i} - P_i = 0 \quad (19)$$

Thus, the marginal revenue product, not the value of the marginal product, of the i th input is equated to its price. Multiply (19) through by $1/PQ$ to get

$$\frac{1}{Q} \frac{\partial Q}{\partial L_i} + \frac{Q}{P} \frac{\partial P}{\partial Q} \frac{1}{Q} \frac{\partial Q}{\partial L_i} - \frac{P_i}{PQ} = 0 \quad (20)$$

The first term is the output elasticity ϵ_i of the i th input; the second term is the product of ϵ_i and the reciprocal of the elasticity of demand, say $\eta = -(P/Q)(\partial Q/\partial P)$; and the last term is the competitive output share of the i th factor. Thus,

$$\epsilon_i = \frac{\eta}{\eta - 1} \frac{P_i}{PQ} \quad (21)$$

It is easy to show that $\eta/(\eta-1)$ is unity plus the markup over marginal cost. Hence, the monopolistic seller sets the output elasticity for each factor equal to $(1 + \text{markup})$ times its competitive share.

Let s_L , s_M and s_K be the actual output shares of labour, materials and capital respectively. While s_L and s_M will also equal the respective competitive shares at market prices, the actual share of capital, s_K , will be greater than s_{Kc} , the competitive share of capital. Clearly, if r is the actual profit rate, then, $s_{Kc} = (r_c/r)s_K$. Since constant returns to scale are assumed to hold, $\sum \epsilon_i = 1$. Thus, the adding up condition, given (21) may be written as follows:

$$\sum \epsilon_i = \frac{\eta}{\eta - 1} \left[\frac{wL}{PQ} + \frac{\mu M}{PQ} \right] + \frac{\eta}{\eta - 1} \frac{r_c K}{PQ} = 1 \quad (22)$$

$$\text{or, } \frac{\eta}{\eta - 1} [s_L + s_M + s_{Kc}] = 1 \quad (23)$$

While the actual shares add up to unity, the competitive shares add up to only $(\eta-1)/\eta$.

Equation (23) can be solved for the demand elasticity η (or the markup factor $\eta/(\eta-1)$) in terms of the observable shares and profit rates. Using the relationship $s_{Kc} = (r_c/r)s_K$, we get

$$\frac{\eta}{\eta - 1} = \frac{r}{(1 - s_K)r + s_K r_c} \quad (24)$$

With the markup thus measured in observable terms, the formula for TPG, corrected for the exercise of price setting or monopoly power, may now be readily derived using (18), (21) and (24):

$$\begin{aligned} \text{TPG}_M &= g_Q - \sum \epsilon_i g_i \\ &= g_Q - \frac{\eta}{\eta - 1} (s_L g_L + s_M g_M + s_{Kc} g_K) \\ \text{or, } \text{TPG}_M &= g_Q - \frac{r}{(1 - s_K)r + s_K r_c} [s_L g_L + s_M g_M + \frac{r_c}{r} s_K g_K] \end{aligned} \quad (25)$$

After substituting from equation (18) and simplifying, this formula can be rewritten in terms of the 'competitive' measure of TPG:

$$\text{TPG}_c = \text{TPG}_M + \frac{(r - r_c)s_K}{(1 - s_K)r + s_K r_c} [s_L(g_L - g_K) + s_M(g_M - g_K)] \quad (26)$$

So long as $r > r_c$ (so that some measure of monopoly power is exercised), the equation of output elasticities with observed shares (which is the conventional method, based on the assumption of all-around competition) to measure TPG produces biased estimates unless all inputs grow at the same rate. TPG_c will be an overestimate of true productivity growth if capital, whose measured share overstates its production contribution, grows less rapidly than labour or material inputs. It will be an underestimate of true TPG if capital grows more rapidly than the other inputs. The only additional information required to arrive at the 'true' measure of TPG (TPG_M) is the competitive profit or interest rate (the competitive cost of capital).

IV

Identifying Production Functions

An alternative to growth accounting – the direct derivation of output elasticities from an econometrically estimated function – exists and has been adopted by Ahluwalia (1991), among others. Ahluwalia estimates production functions for aggregate manufacturing as well as for various sub-sectors of manufacturing. Though the results by no means coincide in the two approaches, the production function estimates of TPG

appear to corroborate her principal finding of a turnaround in productivity growth in aggregate manufacturing in the early 1980s. But the 'production function' she estimates is a 'value-added function' and based on the same single deflation procedure she follows with growth accounting. Hence, her production-function-based findings are no less exempt from errors in the measurement of real value added than her accounting estimates. Our concern here is with the general claim that the econometric approach is superior to the accounting approach.

The putative advantage of estimating an econometric production function (which Ahluwalia accepts) rather than accounting for productivity growth is that assumptions such as constant returns to scale and perfect competition need not be imposed. When estimated, the parameters of the production function directly provide factor imputations (whereas growth accounting takes observed factor shares to be competitive and derives the relevant parameters from these shares) and the contribution due to shifts in factor productivity over the estimation period. Moreover, if flexible functional forms are used, returns to scale or homotheticity can be directly tested for. In this sense, the production function approach may be seen to be more scientific than its accounting counterpart. But the claim to scientificity cannot be made only on the apparent advantage just noted; what matters is the advantage after allowing for the adequacy of estimation of the production function itself. Accepted practice, however, routinely flouts the desiderata of best econometric practice. And even best econometric practice, it would seem, cannot overcome basic difficulties that arise in the identification of the production function. This section delineates the key difficulties involved.

To start with, the widely accepted claim that growth accounting must assume perfect competition is not valid: we have shown that reasonable corrections for product market monopoly power can be made. The minimal assumptions shared by both approaches are (1) a well-behaved production function; (2) stability of the function through time except for 'smooth' shifts; and (3) cost minimisation (which is only a subset of profit maximisation). However, growth accounting must make the additional assumption of constant returns to scale and derives output elasticities (with or without corrections for monopoly) from observed factor shares. An implication of the latter is that observed shares are taken to derive from a situation of market equilibrium. By contrast, if a production function can be estimated, neither of these assumptions need hold: returns to scale can be themselves estimated together with input-output relations whether or not markets are in equilibrium.

This is the advantage of the econometric alternative. How real is this advantage?

The crucial issue here is whether the production function is econometrically identifiable. Let us assume away all problems connected with the quality of data or of aggregation. Thus, assume that output and all inputs are correctly identified at the appropriate level. Consider cross-section estimation. If all firms in the sample possess the same homothetic technology, face identical product and input prices and minimise costs, then, they will all choose the same technique of production. There will be no observable variance in technique on the basis of which the production function can be estimated.

If the production function is non-homothetic, then, techniques will indeed differ depending on the scale of output chosen by each firm. However, it remains the case that output and input choices will be undertaken simultaneously; estimates of the 'production function' in isolation, assuming input levels to be independently given, will be biased and inconsistent. Such estimates cannot be interpreted in terms of the underlying structural model. In fact, the size distribution of firms in terms of output is itself a principal variable in the theory of industrial organisation under imperfect competition and therefore presumed to be structurally determined.

In practice, firms often differ in their techniques of production, sometimes substantially. Were this not the case, the well-established econometric cottage industry churning out cross-section estimates of production functions would long since be out of business. Note the implication of the variance in techniques in relation to the

premises: firms with the same technology and presumably selling in the same market nonetheless face statistically significant variation in factor prices. But without further analysis, it cannot be assumed that the differences are necessarily exogenous. For one thing, firms may in fact vary in their access to different technologies: the 'market' for technology need hardly be perfect. If so, the very basis for fitting a production function, the assumption of a common technology, does not exist. For another, firms may face different prices in product and/or input markets. If these variations are due to differences in product or input quality, then, the widespread practice of treating output and inputs as homogeneous would incur measurement errors, potentially equal in extent to all the measured variance in technique. To be sure, some of the variance may be due to genuinely exogenous price regimes but this has to be affirmed empirically, not assumed a priori. Finally, firms may not all be behaviourally identical. They may vary in their proclivity or ability to optimise their resources (relevant factor markets may be non-competitive enough to support this source of variation as seems evidently to be the case in Indian industry). In such a case, the observed input-output relationship would not define the production frontier.

The problem is hardly alleviated in time-series estimation. While techniques will of course vary with changing prices over time, (a) the problem of simultaneity between output and input decisions remains; and (b) the estimation of a time-series production function must impose irreducibly arbitrary restrictions as regards the nature of technical change over time. In the extreme instance,

suppose that the production function undergoes discrete changes from year to year (a possibility that cannot be ruled out without knowledge of the evolving production function itself). Obviously, such a possibility cannot be tested for (and ruled out) econometrically as the number of dummy variables must equal the number of observations. Hence, time-series analysis invariably assumes a stable production function through time except for shifts that can be econometrically controlled for. This particular difficulty, we hasten to add, would also nullify accounting estimates of productivity growth and is therefore not germane to the present comparison of the accounting and econometric alternatives. But it does impugn time-series estimation of production functions.

Time-series estimation is also frequently plagued by auto-correlation and multicollinearity (in the Indian case at least, especially between time and the capital-labour ratio). Moreover, the use of the 'flexible' translog function to allow for non-homotheticity is itself subject to important limitations. Restrictions on the function, which may be required to ensure that it is well-behaved over the sample observations, "rob the translog function of much of its flexibility, including the ability to approximate a non-homothetic production structure" (Little, Mazumdar and Page 1987:164). The best known study of manufacturing production functions in India presents translog estimates without, however, testing for their good behaviour [Ahluwalia 1991].

Ahluwalia's estimates rely on the translog function because of its virtues but since this leaves too few degrees of freedom in

TABLE A1: OUTPUT AND INPUTS
(Manufacturing, 1973-74 - 1992-93)

her time-series sample, she combines cross-section (2-digit level) industrial data together with time-series. Yet, the premise of her output measures is that the products at the two-digit level are distinct⁵ which conflicts with the basic premise of the econometric estimation that all enterprises share the same technology. In addition, each 2-digit industry is allowed its own intercept while the slopes are taken to be shared by all industries which also denies the existence of a common production function among the same enterprises/industries.

One oft-resorted solution to the simultaneity problem exploits the fact that under a regime of competitive markets (all firms facing identical product and input prices) and constant returns to scale, factor shares will be equal to their respective output elasticities. The production function parameters can be estimated from the share equations under these conditions. But observe that this procedure imposes the untested restrictions of homogeneous output and inputs, constant returns and, above all, identical prices. This last assumption can be readily tested against the actual data. In the Indian case, if the sample includes the typically wide range of small, medium and large firms, then, the assumption of identical prices will predictably fail to hold. Yet, the best known study of micro-level industry production functions in India, which is specifically addressed to the issue of 'small versus large', takes resort to this solution despite the large dispersion in prices [Little, Mazumdar and Page: 1987]. But more pertinently to the context at hand – the estimation of aggregate productivity growth – such a procedure voids even the putative advantage of production function estimation: if the production function is to be econometrically identified only by imposing the assumptions of constant returns and competition, then, one might as well save oneself the bother of estimating these functions and resort to growth accounting instead.

V

Productivity Trends, 1973-93

This section reports the productivity growth results of applying the above-developed procedure for deflating value added, with or without correction for monopoly power in product markets, for the organised segment of Indian manufacturing. The organised segment includes all factories registered under the Factories Act and excludes manufacturing enterprises employing fewer than ten workers with power and those employing fewer than 20 workers without power. The period of study extends from 1973-74 through 1992-93. The choice of time period was dictated by the availability

of data.⁶ Table A1 presents the basic output and input measures employed in the present exercise (the source being the Annual Survey of Industries).

In employing this data for the purposes at hand, the following, rather heroic, assumptions are maintained: (1) Manufacturing output, which is total industrial output less the output of electricity, gas, water and repairs, is taken to be a single homogeneous output with a single well-behaved technology. (2) The wholesale price index (WPI) for manufacturing (base 1970-71) is taken to be the price of this homogeneous output. (3) Labour input into manufacturing is measured by the 'number of employees' and no skill or quality adjustments are made to arrive at a measure of labour in efficiency units. The marginal product of this homogeneous factor is measured by the mean 'emoluments' per employee for aggregate manufacturing. (4) Similarly, total material inputs and the total capital stock for manufacturing are treated as homogeneous aggregates to form material and capital input measures as described below.

The flow of capital services is assumed to be proportional to the (changing) stock of capital. Unlike previous studies, total 'productive capital' inclusive of both fixed and working capital is used. The exclusion of the latter is defensible only if its ratio to fixed capital remains unchanged over time which is demonstrably not the case: not only is this ratio non-negligibly large but it also varies significantly over the period (between 11.3 and 16.3 per cent).⁷ Real productive capital is measured as the sum of working capital deflated by the manufacturing WPI (at 1960-61 prices) and fixed capital at replacement values (also at 1960-61 prices). The construction of the fixed capital series at replacement values follows the perpetual inventory method as described by B-P.⁸

We also follow B-P in the construction of a material price index for manufacturing which is needed to derive the real value (or quantum) of material inputs. This involves two essential steps. First, an appropriate basket or mix of material inputs into manufacturing is identified for a base year. Second, the wholesale price indices for the components of this basket are aggregated using their respective weights in the base year mix to arrive at the material price index. The basket that B-P employed involves 19 items (inclusive of 'own' manufactured inputs such as chemicals and chemical inputs and 'purchased' inputs such as electricity and minerals) and their weights are based on the input-output table for 1973-74.⁹ Dholakia and Dholakia (1994) observed correctly that the input mix employed by B-P applies to all manufacturing rather than to the organised segment alone and proposed an alternative set of weights applicable to

registered manufacturing. But, as B-P noted in their reply [Balakrishnan and Pushpangadan 1995], the method by which these alternative weights are derived is not specified. At any rate, the two sets of weights are insignificantly different from each other which is also pointed out by B-P. While there are undoubted difficulties, due to data limitations, in arriving at the correct set of weights, we thought it fit to stick with the original set of weights proposed by B-P not only to ensure comparability of results but also because theirs appears to be a reasonable even if not the ideal approach to arrive at the needed index. The results we report below are subject to revision, we expect of a minor order, when a more appropriate input price deflator becomes available.

Table I presents the material input price index that we obtained together with the published WPI for manufacturing and for machinery and metal tools ('machinery' in the table). Column 4 also shows the implicit price of gross value added (GVA) obtained in the course of calculating Total Productivity Growth following the procedure in Section II. These various price indices are used to calculate relative prices which appear in the last four columns of Table I and in Figure 1. The first main observation from these is that the material/output price relative rose during the first half of our period peaking in 1982-83 at 126 per cent of its base year level. It declined virtually steadily thereafter but was still about 109 per cent of the base level at the end of the period. Among 'purchased' inputs, mineral oils and especially minerals rose in price (relative to manufactured output) throughout the period with the sharpest increases coming in the early 1980s; the relative price of electricity, on the other hand, remained fairly stable through 1980-81 and rose sharply thereafter. Among 'own' inputs, textiles and chemicals fell while the relative prices of paper products and especially basic metals rose very sharply for most of the period. Clearly, the trend in the relative price of material inputs is explained not only by rising prices of purchased inputs but also by realignments in relative prices within the manufacturing sector. It no doubt reflects, at least in part, the cumulative effects of the oil price shocks.¹⁰

These relative price trends in materials and output show up in the implicit price of value added. The implicit price relative to the price of output (expressed in per cent of its base value) falls rather sharply over the first half of the study period to only 53 (in 1982-83); it rises gently thereafter to about 77 in 1991-92 and substantially in 1992-93 to reach 95. The implication of these measurably large swings in the price of value added is that the current-price series of value added will understate the growth

of real value added in the first half and overstate that growth in the second half of the study period. This is a key observation that underlies the main results on productivity growth, in comparison with previous estimates based on single deflation and (to a lesser extent) with B-P's estimates based on double deflation, to be discussed below.

Table 1 also shows that the price of machinery (a rough index of the price of capital goods) fell a bit during the second half of the period when imports of capital goods rose under a liberalised regime while a domestic excess of capacity was building up. But it is the last two columns that point to the second main observation regarding price trends: the significant swings in material prices and the mild shifts in machinery prices are both substantially amplified when expressed relative to the implicit price of value added. Figure 1 shows the amplification effect quite clearly. Over the period of study, the share of material inputs in output (in current price terms) ranged between 73 and 80 per cent; since the value added share of output is correspondingly small, the change in the relative price of materials to output is amplified several times over in value-added terms.¹¹

Naturally, these price shifts are implicated in any comparison of input intensities (equivalently, partial productivity indicators) at current and constant prices. Figure 2 together with the first five columns of Table 2 help make these comparisons. Material input intensity is measured as the ratio of the value of material inputs to the value of output (at current or constant prices). Similarly, capital intensity is expressed as the ratio of the productive capital stock to gross value added (also at current or constant prices). Several conclusions emerge from a perusal of Figure 2 and Table 2. First, while the material intensity of production, in current price terms, shows a definite uptrend through 1982-83 and a scarcely noticeable trend thereafter, in constant price terms the trend is strongly downward until 1984-85 and upward thereafter. The difference arises from the shifts in the material-to-output price relative noted above and any substitution away from materials that this engenders. Second, capital intensity in current terms broadly rises until 1985-86, falls over the next four years and rises again over the following three; by contrast, there is a pronounced trend fall in the capital intensity of constant-price value added till 1982-93 and an equally pronounced trend increase thereafter.¹² The contrast is due to the trends in the implicit price of value added as well as the (less significant) shifts in the price of machinery relative to that of value added. Finally, the (constant price) value added productivity of labour rose more than two-fold over the entire period but virtually all

of the increase had taken place by 1983-84. Putting these observations together, a sharp contrast emerges between two sub-periods (dividing at around 1983-84 though the turning points vary for each input). During the first, the partial productivity indices of materials, capital and labour (all in 'real' terms) show a marked rise; during the second, material productivity declines significantly and capital productivity declines even more sharply while the rising trend in labour productivity tapers off.

The reader will not have failed to notice that the two rough periodisations – one in terms of trends in (real) partial productivity indices and the other in terms of relative price trends – overlap significantly even if they are not perfectly coterminous. The question might well be raised whether the productivity trends are real or artefacts of the price deflators employed. While we believe that there is still room for refinement in the price indices used, it would be surprising indeed if the clear trend differences in productivity that Figure 2 reveals would be simply ironed out by any such refinement. The overlap in the price and productivity periodisations seems rather to be a coincidence, a spurious correlation. It is nevertheless fair to state that a definitive judgment on this matter must await more detailed work refining the constructed price measures.

The right half of Table 2 sets out the computed indices of Total Factor Productivity which are also represented graphically in Figure 3.¹³ Table 3 reports semi-logarithmic trend growth rates for the productivity indices for the whole period as well as for two sub-periods (1973-74 to 1980-81 and 1981-82 to 1992-93, hereafter 'Period 1' and 'Period 2', respectively). The sole criterion for the periodisation here follows Ahluwalia's central conclusion that there was a break in the trend of manufacturing productivity around 1980-81 following reforms in industrial and trade policy.¹⁴

Observe first that the estimates of TFP with the correction for monopoly power (TFP*M) are very close to the estimates of TFP without the correction (TFP*) for most years.¹⁵ In fact, the difference between the two index values does not exceed 3 per cent in any year. The computed markup rate (reckoned in terms of output, not value-added, prices) is under 8 per cent for virtually all years. The markup factor, it should be recalled, is calculated for all of organised manufacturing – for small and large enterprises and for public and private ones. This may help account for the relatively low value of the markup and the correspondingly small correction needed in the TFP index. Whatever the reason, the discussion that follows leaves TFP*M out.

Table 3 (row 1) shows that the trend rate of growth of TFP was 2 per cent for the entire period. However, it was as high as 5.5 per cent in Period 1 and negative 2.2 per cent in Period 2. The contribution of productivity growth to value added growth was 33 per cent for the study period and, 52 per cent and -96 per cent, respectively, for Period 1 and Period 2. These results are obviously in keeping with the trends in partial productivity already noted and suggest that the early 1980s do mark a turning point but not from negative to positive productivity growth but the other way around. Consider, on the other hand, the productivity index based on single deflation (TFPSD). For the full 19-year period, its trend rate of growth was 1.3 per cent. The productivity growth rate for Period 2, however, is 2.1 per cent and for Period 1 -0.2 per cent (but not statistically significant). Though Ahluwalia's study period ends in 1985-86 while ours extends through to 1992-93, the computed TFPSD index clearly replicates Ahluwalia's conclusion of a positive turnaround in productivity growth.

Finally, consider the productivity index obtained from double deflation (TFPDD). The exponential growth rates in this index are 2.2 per cent for the whole period and 4.6 per cent and -0.2 per cent (not statistically significant) for Periods 1 and 2, respectively. Whereas TFP* yields a significant adverse turnaround in productivity growth between the two periods (a swing of 7.7 percentage points in the growth rate), TFPDD implies a shift only from positive growth to zero growth (a swing of 4.8 percentage points). But the differences between the index values of TFP* and TFPDD are substantially smaller than the differences between TFP* and TFPSD. In this sense and for the specific instance of Indian manufacturing during the chosen period, the double deflation index suffers significantly smaller bias than does the single deflation index. But this need not hold in general. Given the relative price trends over the period, the reader may verify that the biases in the computed TFPDD and TFPSD indices reflect the cumulative effect of the biases in the corresponding TFPG estimates as formalised in equations (16) and (17).

VI Conclusion

We should like first to reiterate the limitations of data that underlie this study in common with all previous studies of productivity growth in Indian manufacturing. Although the productivity index (TPG*) proposed in the present study does away with the biases induced by the single and double deflation procedures, it is nonetheless reliant, as are previous studies, on price

series that have one or another base year. These index numbers cannot accommodate changes in the commodity composition of aggregated output occasioned by the emergence of new products or new materials. But observe that such 'structural' shifts already deny the validity of the assumption of a stable production function necessary to growth accounting. The use of chain indices can only allow for shifts in the weights of a fixed vector of inputs and, at any rate, requires price series based on each year in the period considered which are unavailable. An additional data problem that the present study makes clear is the need for a secure basis for deriving an input price index for manufacturing. The capital stock series used in this and previous studies may also be faulted for being based on replacement ratios derived from data three decades back in 1960. An appropriate dose of scepticism is clearly called for when viewing the productivity index reported in this study as the true measure of industrial performance.¹⁶

The substantive results of this study are at variance with the perception of an improvement in industrial performance in the 1980s as compared with the previous 15 years. However, such a perception needs to be carefully checked against the data for relevant time periods and relevant indices of performance. In terms of the growth in the real value of output our calculations based on ASI data show an exponential rate of 6.9 per cent per annum for the 1973-74 to 1992-93 period; this breaks down into 8 per cent for Period 1 and 7 per cent for Period 2. Though the inter-Period difference is not large, if Period 1 were extended backward to say 1970 or 1965, the difference in growth rates between the two Periods would vanish or even change in sign. Similarly, a different base year, say 1980-81, for the output price series may also make a difference. However, real value-added growth rates are indeed very substantially different between the two periods, a difference that is submerged in the current price numbers of value added. The exponential growth rate is 6.1 per cent for the study period but 10.6 per cent for Period 1 and only 2.3 per cent for Period 2. While index number problems are also probably implicated, the difference cannot be dismissed out of hand on that count. The oil price shocks (and administrative price reforms?) produced significant realignments in relative prices (which certainly show up in the material-input-to-output relative price index employed in this study) that must be accounted for in any assessment of 'real' trends. This is precisely what our procedure seeks to do. While there is room for refinement in the statistical base, it seems clear that the established perception regarding trend shifts is in need of a change.

Notes

- 1 For a model combining an independent investment function governed by profitability and utilisation in industry and an agricultural sector whose output is limited by infrastructure supply, see Rao (1993). Growth is shown to be simultaneously determined by demand constraints (including the mutuality between industry and agriculture) and by supply constraints (reflecting a mix of public financing and supply efficiency parameters).
- 2 If capital (or for that labour) is heterogeneous, then, the appropriate response is to treat it in its disaggregated forms rather than discard the production function itself.
- 3 Dholakia and Dholakia (1994) provide a numerical example of the possibility of negative value added under double deflation.
- 4 B-P acknowledge that double deflation adds a measurement bias due to the "prices used being index numbers with fixed base" (see Balakrishnan and Pushpangadan, 1995, p 463). We have identified this bias precisely; having identified it, it can obviously be eliminated.
- 5 She chooses to measure real output by deflating nominal output at the 2-digit level by their respective wholesale prices, a practice not followed by us (or B-P and Goldar).
- 6 The ASI did not publish statistics for the year 1972-73. Although aggregate statistics for industry and manufacturing are available for earlier years, statistics disaggregated by size of establishment or by ownership are unavailable for years prior to 1973-74. Since the present study (including the paper to follow) aims to provide growth decompositions for both aggregate manufacturing and its disaggregates by size and ownership, it was decided to have a uniform period throughout. This restricts the period of study to 1973-74 to 1992-93.
- 7 The aggregation of working capital and fixed capital, on the other hand, may be defended on the ground that even if they entered the production function as separate arguments, optimisation would render their marginal products equal.
- 8 Goldar (1986) incorporates a positive rate of discard of fixed capital (at 2 per cent per annum) which the present study does not. Since the discard rate in Goldar is constant, any difference this makes in TFP estimates will not be measurably large.
- 9 B-P also used the weights based on the 1983-84 input-output table. In the present study, only the input price index based on the 1973-74 weights is employed. Note also that the wholesale price indices for output and all material inputs have 1970-71 as base.
- 10 The separate influence of increases in administered prices, especially of products produced in the public sector, cannot be ruled out; however, it would be difficult to separate out such an influence from the other major exogenous price shocks (particularly of energy). As far as we are aware, no careful analysis of the pass-through of the oil price shocks into the manufacturing sector exists.
- 11 Though the amplification effect largely reflects the output-to-value-added multiple,

it also depends, as is evident from equation (10), on variations in this multiple through time together with variations in the input and output prices.

- 12 Rising capital 'output' (meaning value added) ratios, reckoned in current price terms, have been a bone of contention in the debate about industrial performance. Rising machinery prices relative to output prices cannot, however, bear any part of the explanation for the rise in (current price) capital intensity during the period of study. While the machinery price relative rose through 1978-79, capital intensity was actually declining from 1975-76 through 1978-79. For the rest of the period, machinery prices fell or at least did not rise.
- 13 TFPG rather than TPG indices are reported as the former are familiar stock-in-trade in productivity studies and also to ensure comparability with previous studies based on single or double deflation. Note also that since the data are annual time-series, all TFPG indices are computed using the Divisia-Tornquist approximation.
- 14 Actually, Ahluwalia identifies two distinct break years: her growth accounting-based analysis suggests 1980-81 as the turning point while her econometrically estimated production function exercise points to 1982-83. In point of fact, no substantively or statistically significant difference emerges from either choice. We have retained 1980-81 as the break year not only because this alternative is highlighted by Ahluwalia herself but also because that choice gives the maximum benefit of doubt to her turnaround hypothesis.
- 15 We have used the loan rate charged by the IFCI and IDBI as the 'competitive cost of capital' for the organised segment of manufacturing.
- 16 Sastry (1995) also notes that while ASI material inputs are inclusive of taxes and duties, output values are ex-factory.

Rukhmabai: Debate Over Woman's Right to Her Person

Sudhīr Chandra

Justice Pinhey's verdict rescinding Dadaji Bhikaji's claim to restitution of conjugal rights over his wife, Rukhmabai, snowballed in the late 19th century into a verbal duel between the Anglo-Indian press and the native press. While the Anglo-Indian press was exultant at the proven moral superiority of the British legal system, the native press was alarmed at the threat of socio-cultural subversion of Hindu family and society the judgment posed. Only in the writings of Malabari and a few other reformers do we find a justification of the verdict based on native discourse of conjugal norms.

I

ON September 21, 1885, an extraordinary judgment was delivered by Justice Pinhey of the Bombay High Court in a suit for restitution of conjugal rights. Filed a year-and-a-half before, the suit involved Dadaji Bhikaji and Rukhmabai who, during the 11 years that they had been married, had never lived together. When in March 1884 Dadaji made the first legal move to claim the company of his wife, Rukhmabai refused on the ground of his poverty – he was unable “to provide her lodging, maintenance and clothing” – and bad health, which was such that she could not “safely live with him”. To these contingent objections Rukhmabai soon added a principle of cardinal importance. She questioned the validity of her marriage with Dadaji. Married when she was 11, before she had “arrived at years of discretion”, she refused to be bound to it. A marriage – even a Hindu marriage – ought not to be hindering on a spouse who had not consented to it.

The case came up for hearing on September 19. The same morning *The Times of India* carried a long letter by ‘A Hindu Lady’ which detailed the tragic plight of Hindu women. To make sure that it did not escape the readers’ attention, *The Times of India* carried an editorial to commend the letter.¹ Given the importance of the premier Bombay daily, and the everyday routine of Anglo-Indian officials, it can be assumed that Pinhey must have read the letter and the editorial before leaving for the court, and that the proceedings in the case later in the day must have confirmed the impressions of the morning’s reading.

The following day was a Sunday and the hearing in the case resumed on September 21. After the evidence and the arguments for the plaintiff had been presented, Latham, the advocate-general, got up to present Rukhmabai’s defence. Before he could speak, the judge told him:

Mr Advocate-General, unless you are particularly anxious to make some remarks for the assistance of the court, I think I need not trouble you as I am prepared to dispose of the case at once.

The advocate-general naturally evincing no such anxiety, Pinhey proceeded to

pronounce a hard-hitting and morally charged verdict. Ever since he heard the case on Saturday, he had been “looking into the authorities” which had convinced him that “the plaintiff cannot maintain this action”. Having given the verdict straightaway, he proceeded to elaborate the grounds thereof.

It was a “misnomer”, Pinhey began, “to call this a suit for the restitution of conjugal rights”. According to the practice in England and British India, a suit for restitution of conjugal rights was one that, in the event of separation and living apart after cohabitation, either spouse could bring against the other. The suit filed by Dadaji was not of that character. In a narrative reflective of his axiomatics Pinhey observed:

The parties to the present suit went through the religious ceremony of marriage eleven years ago when the defendant was a child of eleven years of age. They have never cohabited. And now that the defendant is a woman of twenty-two, the plaintiff asks the Court to compel her to go to his house, that he may complete his contact with her by consummating the marriage. The defendant, being now of full age, objects to ratifying and completing the contract entered into on her behalf by her guardians while she was of tender age.

Having unabashedly shown his sympathies, sympathies natural in one favouring marriage as a contract and consent as essential to it, Pinhey unburdened his shocked sensibility in morally charged diction:

It seems to me that it would be a barbarous, a cruel, a revolting thing to do to compel a young lady under those circumstances to go to a man whom she dislikes, in order that he may cohabit with her against her will. ...

It was, however, on legal grounds that Pinhey avoided doing what appeared to him barbarous, cruel and revolting. As he examined the case law over the agonising weekend, he found that no court had ever ordered “a woman, who had gone through the religious ceremony of marriage with a man, to allow that man to consummate the marriage against her will”. Neither the law nor the practice of the courts in England and India would therefore justify him in “making such an order” or Dadaji in “maintaining the present suit”.

Pinhey realised the futility of expecting an English precedent that would be “on all fours” with the suit before him. For, unlike infant

and early marriages in India, marriages in England were between persons of mature age, and consequently the nuptial and the consummation of marriage were not normally separated much in time. He regretted – and this is important – that “the practice of allowing suits for the restitution of conjugal rights”, which had “originated in England under peculiar circumstances”, was at all transplanted in India. It had “no foundation in Hindu law – the religious law of the parties to the suit” before him. “Under the Hindu law”, he emphasised, “such a suit would not be cognisable by a Civil Court”. Indeed, for many years after he came out to India – in 1851 – the courts did not admit such suits. They began doing so only in the wake of the post-1857 judicial and legal reconstruction that occasioned the amalgamation of the supreme and sader courts into the high courts.

Pinhey’s regret about the transplantation in India of English legal practice was heightened by the fact that it had been discredited in England. Crystallised in Sir James Hannen’s judgment in *Weldon vs Weldon*,² English opinion against the practice had resulted in the Matrimonial Causes Act – Stat 47 and 48 Vic, cap 68 – of August 1884. The act removed the penal provisions of the law which subjected to imprisonment and/or attachment of property a spouse who disregarded the court’s directive to resume cohabitation.³ The act had in fact rendered ‘almost inoperative’ the practice of allowing such suits.⁴

However salutary the changes in England, and whatever the position under the Hindu law, Pinhey knew that he was bound by the unregenerated English law that still obtained in India. All he could do was to refuse to enlarge its application ever so little to include institution within the meaning of restitution of conjugal rights. Legally not incumbent, such an enlargement would be morally reprehensible. In his impassioned words, he was not bound.

...to carry the practice further than I find support for in the English authorities, especially when the granting of the relief prayed would produce consequences revolting not only to civilised persons, but even to untutored human beings possessed of ordinary delicacy of feeling... I am certainly not disposed to make a precedent, or to

extend the practice of the Court in respect of suits of this nature beyond the point for which I find authority.

Secure in the belief that he had devised a legal way out of a moral dilemma, Pinhey was 'glad' that⁵

in the view of the law which I take, I am not obliged to grant the plaintiff the relief which he seeks, and to compel this young lady of twenty-two to go to the house of the plaintiff in order that he may consummate the marriage arranged for her during her helpless infancy.

The moral exuberance of Pinhey's oration belonged in the tradition of those trenchant judicial pronouncements – a classic example being Justice Maule's oft-quoted speech in *Regina vs Hall* (1845), exposing the inequity of English matrimonial laws,⁶ which churned the conscience of Victorian England and facilitated many an important legislative intervention. However, the anxiety to provide his moralism with the cover of law led Pinhey to explain not only the 'why' but also the 'why not' of his verdict. Worried lest his sympathy for the 'enlightened and cultivated' lady be misunderstood – as indeed it was and on purpose – he took pains to clarify that he had not accepted her entire defence. For example, he was in no doubt that Dadaji was a poor man and had given 'much false evidence' about his pecuniary position; and that his uncle had on the same point given, 'if possible, evidence less credible still'. Yet, poverty was 'not one of the reasons' for the rejection of Dadaji's claim. "A poor man", Pinhey felt constrained to reassure, "has as much right to claim his wife as a rich man to claim his".⁷

If Pinhey's cautious concluding remarks were meant to offset the flamboyance of his judgment, the effect was more than neutralised by an outburst from him moments after the conclusion of the judgment. The sheer force of this outburst made it inseparable from the morally charged judgment of which it was not a part. Gaining a fame and a notoriety that enshrined it in popular remembrance longer than the judgment proper, the outburst was sparked off when Dadaji's counsel, Vicaji, took exception to the award of costs to Rukhmabai. Referring to Pinhey's ruling that in Dadaji's case a suit for restitution of conjugal rights did not lie, Vicaji pleaded:

I submit to your lordship that this is not a case in which the plaintiff should be ordered to pay costs. He has been acting under advice of counsel who considered the suit would lie

After the inconsistencies and lies in the evidence for the plaintiff, revealing the despicability of those among whom he was being asked to despatch Rukhmabai, this for Pinhey was the last straw. He had done well, in the judgment, to limit the expression of his displeasure about Dadaji and his

collaborators to the false evidence tendered by them. But he was ill-prepared for an appeal in the name of the plaintiff's innocence. It brought forth the wrath that had been welling up since the week-end:

When the plaintiff found that the young lady was unwilling to share his home, he should not have tried to recover her person, as if she had been a horse or a bullock (*The Times of India*, September 25, 1885).

II

Pinhey's judgment immediately aroused diametrically opposed reactions. It was for some a bold declaration of the Indian woman's right to personal freedom and dignity. For others it was an assault on the sanctity and integrity of Hindu marriage and family that threatened to turn the whole society upside down. The more perceptive among the latter realised the urgency of challenging the judgment to seek its reversal. The prospect of appeal worried the former; They did not want the charter Pinhey had given Indian women to be aborted.

The result in the Dadaji Bhikaji vs Rukhmabai case was now a subject of contentious social debate. No longer two anonymous litigants, the wife and the husband now emblemised the opposing socio-cultural divisions which their private dispute had helped sharpen.⁸ It would henceforth concern these opposing forces, as much as the individual litigants, to seek a resolution favourable from their point of view, no matter how prolonged or expensive the litigation became.⁹

What Pinhey's verdict provoked was a 'war in discussion'. (*Native Opinion*, April 11, 1887). This was not simply a 'civil war', one in which antagonistic positions were taken by different groups in Indian society with regard to the conception of a desirable Hindu/Indian order and the modalities of achieving it. It was also a cultural war between the rulers and the ruled in which the two sought to distinguish their social institutions, ideals and values from those of the other to proclaim their own superiority. It soon developed, in the parlance of our own day, into a well-organised semiotic war.

The Times of India was the first to comment on the verdict, one of the most laudatory. Its remarks set the pattern, generally, for the discussion of the case in the Anglo-Indian press. In a flattering editorial the following day, the Bombay daily described the judgment as 'the embodiment of righteousness and common sense'. Offering in touching terms a brief account of Rukhmabai's tragic life, it referred to the letters of 'A Hindu Lady' – though maintaining the mystery of the pseudonym – to remark that she

never dreamt of a harder case than this when she told us that the evil custom of infant marriage had destroyed the whole happiness of her own life in a pitiable manner.

Happily Justice Pinhey "declined to allow the law to be made an instrument of torture". "He showed", the paper continued, "that a suit of this kind was a creation of the English law, which was intended to refer only to persons of mature age, who accepted the responsibilities of marriage with their eyes open". "There was", moreover, "no authority in English law to support a case like this, and his lordship did not wish to extend the law further". He also said that there was "nothing more barbarous than to compel a young lady to go to a person whom she disliked".

The Times of India saw in the judgment 'a shrewd blow at the whole system of infant marriage' that could not 'fail to have a most wholesome influence in the direction of reform':

With the use of a little firmness and common sense. Mr Justice Pinhey has, in the course of a morning's work, probably done more for the amelioration of the wretched condition of Indian womanhood than has ever, yet been accomplished. (*The Times of India*, September 22, 1885).

The celebration of Pinhey's verdict overpitched its moral righteousness. Comparatively little attention was paid to its foundation in law. This was to an extent unavoidable in view of the resounding moralism of the verdict. But there was something in the cultural arrogance of the average Englishman and woman in India and England which ensured that certain significant aspects of the verdict were relegated to the zone of their cognitive blindness. Thus, *The Times of India* justified the English law of restitution of conjugal rights in terms of the obligation of mature men and women to honour responsibilities they had accepted with open eyes. It overlooked Pinhey's lament that a law which had long been discredited, and recently changed, in England, still operated in India. Similarly, Pinhey's assertion that restitution suits were alien to Hindu law was ignored as if it had not been made at all.

This is reflected even more sharply in an editorial as *The Times of India* stayed with Pinhey's verdict for the second consecutive day. Humanising the verdict, as it were, almost to the point of denuding it of any legality, the paper commented:

Mr Justice Pinhey has decided that a young girl married in her twelfth year, and without any consent of her own to a man unable to maintain her and in a feeble state of health could not ten years afterwards, when she had arrived at years of discretion, be forced to live with him.

Having secured both law and morality on the side of the English – and oblivious to the denunciation of the British Indian legal machinery that the following, italicised praise for Pinhey's verdict implied – *The Times of*

India proceeded to attack Hindu laws and society:

The Hindu marriage laws are as unjust as they are unnatural. But a distinct step in advance has been gained by Mr Justice Pinhey's decision... And for the first time, so far as we remember, in India, the law distinctly refuses to be made the instrument of this personal degradation. (italics added, *The Times of India*, September 23, 1885).

Now that an English judge had struck for social reform and a brave Indian girl, inspired by English ideas and example, had stood up 'to vindicate the rights of Indian womanhood', it was for the Indian reformers to build on these gains. For if utilised properly the agitation commenced by the Rukhmabai case could produce 'very far-reaching consequences'. Their responsibility was particularly grave, the paper warned, in view of the plaintiff's rumoured intention to appeal (*The Times of India*, September 25, 1885).

This was the general pattern of reporting on the case in the Anglo-Indian press. This was so partly because of the wide reliance on *The Times of India's* coverage of the case, because the city's other leading daily, *Bombay Gazette*, was lukewarm about it.¹⁰ More important than that, there was an overall similarity in the Anglo-Indians' stance with respect to the country of their temporary domicile.

Thus, despite local professional rivalry, the *Bombay Guardian* reacted to the case in a manner not distinguishable from that of *The Times of India*. It claimed, unjustifiably that for years it had been 'singular' in its opinion that the government should "recognise nothing as marriage in which the marrying parties were not of marriageable age, and in which they did not voluntarily make the compact". Someone was needed to 'break the ice', and Pinhey had done just that. Of course, this could not have been possible without Rukhmabai's refusal "to be sacrificed". In taking "this noble stand", the *Guardian* wrote, "she has very ably fought the battle, not for herself merely, but for the millions of her sisters."¹¹

In far-away Allahabad the *Pioneer* was quick to grasp that the problem lay in "the awkward grafting of our English marriage laws upon a Hindu marriage system to which they were never intended to apply". But, betraying the typical Anglo-Indian lack of receptivity to those portions of Pinhey's judgment that related to the English and Hindu laws with respect to restitution of conjugal rights, it could see nothing wrong with the English and right with the Hindu laws. It regretted that the unfortunate grafting had made English laws an instrument to compel English judges in India to "give legal sanction to some of the glaring iniquities of Hindu customs". Luckily Pinhey's 'far-reaching and most salutary decision' had shown a way out of the awkward situation.

It had 'legally' established that "a girl whose marriage has gone no further than a formal ceremony in her infancy cannot in after-years be compelled against her will to accept the position of a wife".

The *Pioneer*, too, exhorted the Indian reformers, anxious to remove the abuses of their marriage customs, to make use of Pinhey's verdict. Explaining how the judgment could yield 'a great deal', the paper worked out its logic:

The next step would be to establish the argument that a woman who cannot be compelled by law to accept the position of a wife is not a wife in the legal sense, and that, therefore, should her so-called husband die, she cannot become a widow. This position, once established by law, would have enormous effect upon the evils of Hindu womanhood. The force of the baneful custom is almost entirely owing to the claims which infant marriages give to family property. But, unless the law recognises the marriage, the claims to property would be valueless, and thus the one great incentive to infant marriages would be removed.

Further, trusting that the reformers would not 'overlook the importance of this simple argument', the *Pioneer* advised them to "take every means to secure that Justice Pinhey's decision shall be upheld, and subsequently carried to its logical conclusion."¹²

Coming from the powerful Anglo-Indian press, especially the *Pioneer* with its virtual position as an official organ, the advice to Indian reformers revealed an all too glib reliance on the rhetoric of moral-cultural superiority. The reformers could well have turned Pinhey's judgment to their advantage if it became a precedent for future judicial decisions. But while its validity hung in the balance, they could hardly have done more than their self-righteous declaimants to prevent its reversal. Malabari, the great crusader for the cause of Indian women whose stakes in the Rukhmabai case could not have been lower than those of the Anglo-Indian declaimants, understood this when he wrote as he anxiously awaited the outcome of the appeal against the Pinhey verdict:

It is lucky for Rukhmabai that she has counsels like Messrs Inverarity and Telang. The latter, who has his whole heart in the business, may be trusted to do all he can for her. But it is hard to see what can be done, unless the final Court of Appeal refuses to recognise unconsummated infant marriages (*Indian Spectator*, March 6, 1887).

Farther off in Lahore, the *Civil and Military Gazette*, second to none in imperial pride, saw eye to eye with *The Times of India* to the extent of being close to plagiarism. There was one difference, however. While drawing freely upon the comments and reports of its Bombay contemporary, occasionally employing the same words even, the *Gazette* was aggressively revelling in its tone about

Hindu laws and customs, indeed about the very character of the Hindus. Displaying the other side of English humour – by no means uncommon in contemporary Anglo-Indian writing, especially when it was directed at India and Indians – the Lahore daily tended to employ for effect exaggeration rather than understatement. Assuming an air of high neutrality and seeming not to be sparing Pinhey either, it wrote:

Whatever may be Mr Justice Pinhey's shortcomings, in the matter of jealous Hindoos who bite off the noses of their mistresses, it cannot be denied that he has most notably helped forward the cause of social reform...

With gleeful sarcasm the *Gazette* then described how the stepdaughter of a "well known native doctor in Bombay was married, at the mature age of eleven years, to a man suffering from symptoms of consumption, and unable to support her...". Not failing to mention the bit about the barbarity of compelling a young lady, the *Gazette* continued:¹³

The idea of establishing any comparison between the marriage of an English man and woman of mature years, and two native children of nineteen and eleven, would strike most people as preposterous (emphasis added).

Yet again, true to the pattern, there is in these spirited comments not a trace of comprehension of Pinhey's criticism of English and appreciation of Hindu laws on the subject. The *Civil and Military Gazette* rivalled *The Times of India* in undermining the legal basis of Pinhey's verdict. For example, it wrote, "From the evidence it appeared that the present plaintiff was not able to maintain his wife; and a decree was accordingly given for the defendant with costs" (*Civil and Military Gazette*, September 30, 1885).

That the Anglo-Indian response with regard to this case should be similar seemed but natural to the *Indian Daily News*. Owned by a merchant and tending to cover business and sports more than politics, the *News* was a sober Anglo-Indian daily. "European sympathy", it wrote, "is naturally on the side of the Judge's decision". Providing proper salience to Pinhey's admonition that a woman was not a horse or a bullock, and quoting verbatim his stirring refusal to do something 'barbarous', the *News* found the verdict 'thoroughly' in accord with 'European notions of justice and equity'. It added its own precious commentary: "It is abhorrent to European ideas that a girl bound as a child, before she could possibly exercise any personal choice in the matter, to a man whom she grows up to detest, should be forced to go and live with that man".

Unlike its Anglo-Indian contemporaries, however, the *News* was sympathetically

inclined towards the husband as well. It wrote:

But the fact can scarcely be conveniently put out of sight that the man also has a grievance. He is saddled with a wife who is not a wife . . . not in the sense that she is a burden upon him . . . but in the sense that she is still legally his wife. Mr Justice Pinhey's judgment, though it debars him from access to his wife, does not sever the marriage tie. So if the young wife is a victim of the unfortunate marriage custom of the country, the husband is only a degree less a victim.

With its exceptional ability to empathise, the *Indian Daily News* was quick to inter: "The case points very clearly to the necessity for legislative interference in the matter of infant marriage"¹⁴ But even the *News* could see in the judgment little besides the triumph of 'European notions of justice and equity'.

The whole stress in the Anglo-Indian reading of Pinhey's verdict was on the oppressive social system of the colonised and on the possibilities of changing it that, in a morning's work, an English judge had opened for those among the colonised who cared to reform their society. It is not that these papers literally blacked out those portions of the judgment that castigated the English legal practice imported into India and emphasised the non-admissibility of restitution suits in Hindu law. The blacking out was more imperceptible. It occurred in the act of reading.

It was a reading that celebrated Pinhey's judgment, but without grasping his analysis of developments in India and England that gave him the strength to deliver such a judgment. It could come up to the point of highlighting his ruling that in India a suit for restitution of conjugal rights was 'a creation of the English law'; but without facing the inference that the rulers who created the law could not escape responsibility therefore.

The entire blame, in this reading, rested with Hindu laws and customs. So complete was the imagined contrast between the English and native sensibilities that, in the face of palpable evidence to the contrary, it was believed that Pinhey's verdict had no supporters among Indians. The very logic that prompted the English, to hail the verdict led them to assume that the natives would be hostile to it.

III

Precisely those reasons that caused the Anglo-Indians to celebrate Pinhey's judgment impelled sections of Hindus/Indians to condemn it strongly. What the *Pioneer* called the 'simple argument' of the judgment appeared to these Hindus/Indians as the thin end of the wedge. Beginning with a questioning of the traditional customs of marriage, they feared, it would destroy the foundations of Hindu/Indian society. The initial, and main, opposition, however, came from among the

Hindus as they were most directly affected by the judgment.

Hostile reactions to Rukhmabai and to Pinhey's verdict came from all over the country. The earliest and, perhaps, the best argued critique appeared in the *Native Opinion*. This Anglo-Marathi weekly from Bombay was controlled by Vishwanath Narayan Mandlik (1833-89), a leading authority on shastric and Anglo-Hindu laws. His long introduction to the *Vyavahar Mayukha*, which he translated into English, and the scholarly appendices at its end, bear witness to his understanding of shastric and customary laws.¹⁵ Often considered an arch reactionary – in the Rukhmabai case controversy he unabashedly stood behind Dadaji – Mandlik was, in fact, not opposed to social reform *per se*. Living in a subject country, however, he believed in the primacy of political reform.¹⁶ Moreover, as against social legislation, he favoured the idea of 'reform from within'. For this we have the testimony of Narayan Ganesh Chandavarkar (1855-1923) who, as editor of the progressive Anglo-Marathi weekly *Indu Prakash*, was locked in a running battle with Mandlik during the Rukhmabai case, as also on numerous other occasions.¹⁷ Bchramji Malabari (1853-1912), the great crusader of Indian women's cause who had made Rukhmabai's case his own, thought otherwise. 'Mr Mandlik's career', he wrote, 'is known to have been devoid of every liberal sentiment.'¹⁸ We have little reason to disbelieve Chandavarkar. But during the Rukhmabai controversy – which is when Malabari assailed Mandlik – the *Native Opinion* wrote as if determined to prove Malabari right.

Those who viewed Pinhey's verdict as a threat to their domestic and social life ignored its legal base even more than did those who welcomed it as an occasion for self-laudation. Their anxiety, in fact, was aggravated by the ways in which the judgment was projected in the Anglo-Indian press. The verdict was also, to an extent, designedly misconstrued. But it was a misconstruction for which many Hindus were predisposed; it did not strain their credulity. Ironically enough, even these Hindus missed the respect for their law that was implicit in Pinhey's ruling that suits for restitution of conjugal rights, only recently discredited in England, were unknown to Hindu law. What worried them was the fear of socio-cultural subversion following the judge's refusal to force a Hindu woman to cohabit with her husband.

The *Native Opinion*, in a powerful indictment, declared that the verdict, 'to say the least of it', involved 'a revolution in the marital laws of Hindus'. It was 'entirely subversive of the principles that have governed society for ages'. 'Apart from the merits of the particular case', the weekly warned:

this decision is calculated to alarm the Hindu community, who have all along been under the impression, and very justly so, that their marital relations were to be governed by their own ancient laws whose protection was secured to them by legislative enactment and by the decisions of the Highest Courts in India and in England. We think that the Hon'ble Judge in departing from that law has fallen into the error of mistaking his functions. . . . Mr Justice Pinhey has tried to legislate and not to interpret existing laws; and when a judge attempts to do so then there is an end to all stability. The single decision of Mr Justice Pinhey will convulse the whole community. Husbands and wives would be deprived of all their rights under the Hindu Law and Mr Justice Pinhey will have done all this in the Court-house and not in the Council-chamber.

If the concluding sentences in the excerpt sound like rebutting *The Times of India's* exultation about a momentous morning's work by Pinhey, the *Native Opinion* was, indeed, reacting to its Anglo-Indian 'brother'.

The *Opinion* disputed Pinhey's propositions – calling them 'serious inaccuracies' – "that a suit of this kind was a creature of English law, and that there was no decision on this point". "Suits for restitution of conjugal rights", it rebutted, "have often been brought in Indian courts and those courts have often given relief to the plaintiff-husbands". These 'Indian decisions' showed 'conclusively' that such suits were "founded upon the Hindu and the Muhamadan Laws which, nobody can deny, are peculiarly Indian". It was, in fact, 'taken as settled beyond all dispute' that the 'Hindu Law authorities' recognised such claims.

There were decisions in which the Calcutta and Bombay High Courts had, under the Hindu law, granted, 'as well against grown up as against minor wives', the kind of relief prayed for by Dadaji. The pointed reference to minor wives was designed to take care of Rukhmabai's argument that she had been married when she was incapable of giving intelligent consent. These decisions, the *Opinion* added, had issued from judges like "Justice Couch, Melvill, West, and Mitter, men who, it must be allowed, know Hindu law and custom at least as well, if not better than the Hon'ble Mr Justice Pinhey".

This appeal to established judicial authority was capped, appropriately enough, by a reference to the privy council, the highest judicial tribunal for colonial India. This related to the Moonshee Buzloor Rukhmee vs Shumsoonissa Begum case, which was to prove a decisive authority in favour of Dadaji at the appellate stage in his case. This was a Muslim case in which a man had inveigled a rich widow with five children into marrying him six months after the death of her first husband. They lived together for some years, during which time the man managed fraudulently to make away with a great part

of his wife's fortune. He then commenced to ill-use her, virtually making her a prisoner in the house. Following magisterial intervention, she quit the husband's roof, with bare clothes on her back, and took up separate residence. Meanwhile she obtained a decree of five lakh rupees against the man. At this stage he brought a case of restitution of conjugal rights against her. His pleader argued that the case must be decided according to Muslim law, which did not permit a wife to separate from her husband, except upon a divorce; cruelty being no ground for the court to set aside the Muslim law.

The *Native Opinion*, significantly, spared its readers all these crucial details and quickly moved on to the privy council after quoting briefly from the Calcutta High Court judgment. Because of the pivotal role of this case in the disposal of the issue raised by Pinhey, and also because it helps us locate him within a certain juridic genealogy, we may follow the high court verdict in greater detail than did the *Opinion*. The judges, C Steer and W S Seton-Karr, observed:¹⁹

Are we to compel the Defendant to return to her Husband, convinced as we are that she should not be forced to return? If under the Mahomedan Law no Wife can separate herself from her Husband under any circumstances whatsoever, the law is clearly repugnant to natural justice. The Mahomedan Law giving no relief to a Wife, be the conduct of the Husband ever so bad, it is a case to be disposed of by equity, and good conscience. And on these principles, we have no hesitation in saying, that the grounds upon which the Defendant has separated from her Husband justify her in that step, and that we should be making the Court the engine of a grievous injustice, if we gave the Plaintiff free power and control over the person of the Defendant, by ordering her to return to him.

The *Native Opinion* demonstrated how, in overruling this verdict, the privy council had enunciated the guiding principles of the 'policy of the law in British India'. This policy forbade the disposal of certain categories of cases in accordance with equity and good conscience: 'i.e. according to what the judge may think the principles of natural justice require to be done in the particular case'. Instead, the privy council directed that:

in suits regarding marriage and caste, and all religious usages and institutions, the Mahomedan Laws with respect to the Mahomedans and the Hindu Laws with regard to the Hindus are to be considered as the general rules by which Judges are to form their decisions...

The *Opinion* further quoted with relish the privy council's strictures against the high court, maintaining that nothing was:

more likely to give just alarm to the Mahomedan community than to learn by a

judicial decision that their law, the application of which has thus been secured to them, is to be overridden upon a question which so materially concerns their domestic relations.

"We can safely say", the weekly charged, "that the decision of Mr Justice Pinhey is calculated to do what the Privy Council have so solemnly deprecated".

It further countered Pinhey's position about restitution suits being a creation of the British in India with the assertion that formerly also, 'when there were no courts like the present', claims for restitution of conjugal rights were recognised by Hindu law authorities. To these authorities, which consisted of caste heads, deserted 'Hindu husbands always carried their complaints', and the 'authorities always compelled the wives to go and live with their husbands'. (strikingly enough, husbands alone are mentioned in this context.)²⁰

On the question of how the traditional authorities enforced their decisions, however, the forthright Hindu weekly suddenly became vague. Instead of specifying the penalties, it wrote that these were 'at least as effectual in their effects as imprisonment'. The quaint tautology of 'effectual in their effects' apart, the invocation of traditional legal procedure carried an oblique disapproval of imprisonment for contumacy in restitution cases, a punishment which was a gift of the British.

The *Native Opinion* faulted Pinhey also on the merits of the case. It assumed, as did so many others, that the judge's 'mind was swayed by the fact that the defendant was married when a minor'. From that assumption it drew the inference that the judge must, therefore, have considered the marriage of Dadaji and Rukhmabai invalid. Perhaps realising the effect the argument would have on people for whom gods and goddesses were more than mere mythological figures, it pointed out that 'Hindu gods are married when they are minors'; and mischievously added: 'the Hindu Law does not give them any relief on that ground.' This done, it asked with a flourish: 'The question is, granting that the defendant was a minor when married, as all Hindu wives are, was it a valid marriage or not?' It proffered the decisive answer: 'If it was a valid marriage, and according to Hindu Law it indisputably was, the right of the husband in this case admits of no dispute.'

With concerns exactly the opposite of the *Pioneer's*, the *Opinion* dreaded the 'monstrous' consequences that would follow if marriages contracted during minority were declared invalid. Of several such consequences, it mentioned only one: 'the right of maintenance of wives and widows would be rendered null and void'. A consummation such as this, it wrote sarcastically, might not appear 'sufficiently alarming' to 'certain persons'. "But" it harangued, "a judge must deal with the whole country and its people and not with a few people who may perhaps

not be afraid to see the fabric of their society turned topsy-turvy all at once."

The weekly admitted that the judge had neither accepted the issue of poverty nor referred to the husband's state of health. But it shrewdly related the two issues to the question of the wife's dislike of her husband. Pinhey, we will recall, had admitted with injudicious candour his abhorrence for forcing a woman into the arms of a husband she disliked. But he had found in law an escape from what seemed to him an immoral course. The wife's dislike was no ground for his verdict. The *Native Opinion*, however, treated the moral impulse behind Pinhey's judgment as its legal rationale. It ascribed Rukhmabai's dislike for Dadaji to his poverty and poor health, the sole grounds on which – so the weekly insisted – she had refused to live with him. It twisted the argument about 'dislike' to contend that Pinhey had given his verdict because of the husband's straitened circumstances and other extra-judicial considerations:

Now as to the allegation of the husband's ability to maintain, we are glad the Judge does not hold that the poverty of the husband was a good answer to resist his claim. The inability to maintain is a relative term and can be used in almost every case. What may be competence to one may be poverty to another, and if such an indefinite definition were held good in such suits society would be sorely disarranged. With regard to dislike we may remark that there is only one case in which a wife can resist her husband's claim to conjugal rights and that is in the case of cruelty which involved danger or fear of danger to her person by the violence of the husband. We think the learned Judge completely misunderstood the law on the subject, like or dislike having nothing to do with the matter. We cannot but think that Pinhey was influenced by considerations other than judicial.

As for considerations other than judicial, the orthodox weekly mocked Pinhey's sense of moral outrage so as to deny him even the courage to defy law in the service of justice and conscience. Pinhey, it contended, had 'committed a grave error', and it dramatised the implications of the error in a way that would appeal to the conservative instincts of its readers:²¹

His decision in fact amounts to saying that any Hindu wife might any day refuse to go to her husband. It is according to him enough if she says that she dislikes him. The learned Judge does not seem to have seen the consequences of his judgment. It goes to the root of the marital tie and is entirely subversive of the principles that have governed society for ages.

These implications could arguably be teased out of Pinhey's judgment. The *Native Opinion*, in any case, was confident enough of the correctness of its analysis to predict

that, if appealed, the judgment stood little chance of being stayed. Nonetheless, it was an alarmist analysis; one produced by an anxiety about the very survival of cherished values and institutions. Hence, the note of panic and the resultant inclusion of issues that should have been ignored as irrelevant in view of Pinhey's verdict, e.g. poverty and ill-health, if not dislike as well. In this state of anxious excitement, it was difficult to realise that the critical distinction between the restitution and the institution of conjugal rights, as made by Pinhey, did not necessarily imply questioning the validity of marriages performed before years of discretion. The distinction was intended as a justification for not extending the application of a discredited alien legal practice.

That, in spite of the judge's intention, the distinction admitted of being interpreted as subversive of the Hindu custom of infant and early marriage, is evident from the similarity on this point in the triumphant Anglo-Indian and the alarmist Hindu views of it. This interpretation – so powerful was its hold – survived powerful arguments to the contrary from Latham and Telang before the appellate court.

Representing the fears and ruffled feelings of sections of Hindus, and backing its demolition of Pinhey's judgment with impressive legal erudition, the *Native Opinion* set the pattern for those opposed to Rukhmabai and Pinhey. Alarm was the dominant feeling in this response. Alarm got the better of whatever confusion there was about the verdict; and it also submerged the occasional admission of the humanitarian dimensions of the case and the verdict. This is exemplified by the *Mahratta*, an Anglo-Marathi weekly that appeared from Poona under the guidance of Lokamanya Balgangadhar Tilak (1856-1920), then fast emerging as a nationalist leader with pronounced Hindu leanings and opposed to official interference in socio-religious affairs despite admitting the need for social reform.

Writing a fortnight after the *Native Opinion* had launched its attack, the *Mahratta* tied itself into knots; but without for a moment losing the clarity of its opposition to Pinhey's verdict. The Poona weekly was glad to see that the verdict had not 'commended itself to the majority of our Hindu brethren'. At the same time, it claimed to stand 'for reform', admitting that the verdict appealed to its 'humanity on social and religious grounds'. In the same sentence, a bare comma separating the two statements, it also added that it felt 'forced to condemn' the verdict. The reason: 'Mr Justice Pinhey has not understood the spirit of Hindu laws.' He had sought to introduce reforms 'by violent means', and endeared himself to 'a certain set of reformers' – obviously those whom the *Native Opinion* had accused of revelling in the topsy-turvy of their society.

The *Mahratta* substantiated its charge by ascribing to Pinhey the view that 'among Hindus the performance of the marriage ceremony is merely a contract which might be set aside before consummation'. With his 'knowledge of local customs', the learned judge should have known that: 'A Hindu marriage, once entered, can never be dissolved.' Instead, the *Mahratta* complained: 'It is merely a principle of the English law, English custom that Mr Justice Pinhey had consulted in the present case'.

We have seen that what Pinhey had done was to refuse to extend the application of an English legal practice. In spite of using the term 'contract' for both Hindu and English marriages – cf the *Mahratta*'s scrupulous use of entered, rather than contracted, for Hindu marriage – Pinhey never assumed that Hindu marriage was a bond that could be dissolved. If anything, he had invoked the Hindu law, and recalled with regret its supersession by the British Indian law courts in matters relating to restitution of conjugal rights. In fact, after lashing out at Pinhey for forgetting the fundamental point about the indissolubility of Hindu marriage, the *Mahratta* itself remarked: 'The wife, then, may refuse to live with her husband, but for all that she is debarred from marrying another'.

What else had Pinhey done? After all, the *Indian Daily News* had been quick to grasp something that made it sympathise with the husband as well, and call for a change in the existing law, i.e., that Pinhey's decision had not disencumbered Dadaji because the marriage tie that bound him to Rukhmabai was beyond severance. At no stage in the litigation, it may be noted, did Rukhmabai's defence ever take the position that the rejection of Dadaji's plea for the restitution of his conjugal rights would bring her the freedom to enter into – or contract – a new marital relationship. She herself had no illusion in this regard. Such a freedom, she knew all too well, belonged exclusively to the husband, whether or not restitution was ordered.²² The following from a letter of hers which appeared in the *London Times* merits perusal in this regard:

... a man can marry any number of wives at a time, or whenever he chooses to do so, keeping all of them with him, or driving away those for whom he does not care much; while a woman is wedded once for all. She cannot remarry even after the death of her first husband,²¹ nor can she deny to live with him even on reasonable grounds.... Is it not inhuman that our Hindu men should have every liberty while women are tied on every hand for ever? (*Times*, April 9, 1887).

Instead of turning to the glaring sexual inequality of the traditional arrangements, the alarmist Hindu response spelt out the ominous consequences that Pinhey's verdict would have for women. The *Native Opinion*

having indicated the threat to the 'Hindu wives' and widows' right to maintenance, the *Mahratta* quoted the following elaboration of part of the same point from the *Indian Nation* of Calcutta:

Where a man possessed of property has married a girl of eight or nine, and died before consummation of marriage, it would be dangerous to hold that the infant widow was not entitled to her husband's property, because the marriage-contract had not been completed.

More and more Hindu critics of Pinhey stressed the risk posed by his verdict to the rights of Hindu wives in general, not just widows. For, the denial of the rights – indeed, the very status – of a wife on the ground of non-consummation of marriage could ensue even while the husband was alive. This argument assailed the verdict where it was supposed to be strongest. It sought to demonstrate that even in terms of humanitarianism, a plane at which the *Mahratta* itself sympathised with the verdict, Pinhey had harmed the interests of a whole class of hapless Hindu girls, those who had been married before the years of discretion and whose marriage had not been consummated.

Besides his humanitarianism, Pinhey's understanding of marriage as a contract also was attacked. The *Mahratta* mounted this offensive from an unlikely angle. It began by criticising the judge for having disregarded the authority of parents and guardians. It was Rukhmabai's legal guardians who 'had entered into the contract for her and on her behalf'; but the fact had received 'no consideration' from the judge. Giving its defence of traditional parental authority a sudden switch, the weekly directed the focus on hard material factors. Dadaji's family must have incurred on the marriage what in 'their poor circumstances' must have been 'a heavy expenditure'. Employing the language of contract with abandon, the *Mahratta* argued somewhat facetiously:

If he cannot get his conjugal rights restored, so much money becomes a dead loss to him. Can he file a suit against the legal or natural guardians of his wife for compensation? If they are dead, are heirs made liable? If they are not, who is to reimburse him for the pecuniary loss which he has suffered?

Coming back to the status of Hindu marriages, now threatened by this verdict, the Poona weekly observed in a pragmatic tone:

Infant marriages will not be discontinued in the space of a dozen years more. Are all the marriages that take place, in which the bride's age happens to be 11 or 12, or less, liable to the same construction?

It concluded with the hope that, because 'weighty considerations like these' had not found 'any weight with the learned Judge', 'a strong protest will be made all round

against the decision' (*Mahratta*, October 11, 1885).

The realism of the observation that infant marriages would not disappear within another dozen years may have been informed by a desire for their eventual disappearance. But the question about the validity of marriages effected when the brides were 11 or 12 belonged to a different class. It related to a crucial contemporary distinction between infant and early marriage, one in which only infant marriage was treated as undesirable. Early marriage, on the contrary, was considered essential for the functioning of joint family, the linchpin of Hindu social organisation. Those who thought along these lines could not accept a verdict that seemed to question so pivotal a custom.

Among the first to relate Pinhey's judgment with the institution of joint family was an anonymous correspondent to an Anglo-Indian paper of Bombay. Observing that 'however justifiable it might be in equity', the judgment was 'certainly not so in law', he repeated the usual charges relating to the role of extra-judicial considerations, i.e. poverty, ill-health and dislike; also that the judgment, even if 'chivalrous', was based on 'a misconception of the manners, customs, and usages obtaining in Hindoo society'. He continued (we may note the frequency with which the word 'Hindoo' recurs):

amongst the Hindoos the marriage of a woman after twelve is a very rare phenomenon. So the 'years of discretion' plea of the learned judge cannot hold good in the case of a Hindoo lady. What might seem good from an English point of view cannot certainly be adapted to the altered circumstances and peculiar constitution of Hindoo society. The joint family system in vogue amongst the Hindoos imposes certain restraints upon the social liberty of individual members of a Hindoo family, and the plaintiff's adherence to this traditional system should not interfere with his right to call his wife to live with him under the family roof.

The anonymous correspondent ended with a demand for 'rigorous action in the matter of infant marriages'.²⁴ He did so because, in his view, the necessity for such action had been 'proved' by the Rukhmabai case (which did not involve infant marriage). This shows the loose logic that marked much of the debate on this case. This lack of rigour was shared by many of Rukhmabai's supporters also, though she herself was very clear that her tragedy was due to early rather than to infant marriage.

In addition to questioning the defensibility of the judgment from every possible point of view, not excluding its equity and humanitarianism, the critics of Pinhey and Rukhmabai had to grapple with the problem posed by the identification of the much acclaimed 'A Hindu Lady' as no other than Rukhmabai. For, however hard they tried to

confine the controversy within the limits of abstract legalism, concrete humanitarian considerations kept obtruding irresistibly. And it made a difference if the victim was an accomplished and cultivated young lady.

The disclosure about the identity of 'A Hindu Lady' was first made by the *Bombay Guardian* in the course of commenting on Pinhey's judgment. However, *The Times of India*, which alone was supposed to know, chose to evade the issue. 'Whoever she may be', it said, the 'Lady' wanted her name to be kept secret (*The Times of India*, September 25, 1885). Rukhmabai's advisers may have calculated that it would be best to reveal the identity and harness the resultant sympathy when the lady, in the event of an appeal, was threatened with defeat rather than in the hour of an uncertain triumph. For the moment, consequently, the *Bombay Guardian's* disclosure was no more than a rumour.

But for those aware of the subversive potential of the case and the verdict, this was a disconcerting rumour which needed to be squashed. As always in such situations, the first reaction was to deny its veracity. The man who quickly sensed danger and moved to counter it was K R Kirtikar, once a protégé of Rukhmabai's stepfather, Sakharam Arjun, and now a hostile witness. Kirtikar spoke with the authority of one who knew Rukhmabai's family as an insider. In a letter to the *Bombay Gazette* he affirmed that, 'as far as I know' (and he professed to know a great deal), Pinhey's decision, 'legal or illegal, safe or dangerous', had 'no connection whatever' with the 'Hindu Lady' (*Bombay Gazette*, October 6, 1885).

IV

The *Civil and Military Gazette* saw in the alarmist Hindu response the true reflection of 'the native mind' on the issues involved in Pinhey's judgment. The *Bombay Gazette*, likewise, believed that the 'native papers unanimously disapprove of the judgment of Mr Justice Pinhey in the case of Rukhmabai and her poor illiterate husband' (*Bombay Gazette*, October 5, 1885). This summed up the English feeling in this regard. The number of Indian journals that supported the judgment was admittedly small as compared to those which either opposed it strongly or displayed an ambivalent attitude. In terms of their visibility, however, the former were not the kind that could be missed easily. The explanation for the general English assessment of the Indian reaction, therefore, seems to lie more in the mode of English perception than in the reality of Indian reaction.

The most visible, and also the most determined, Indian supporter of the judgment was Malabari's *Indian Spectator*. However, owing to Malabari's absence from Bombay when Pinhey unexpectedly cut short the proceedings in the case and delivered his judgment, the first write-up in the *Spectator*

turned out to be a masterpiece of vacillation rather than, what one would have expected, a passionate defence of the verdict. The writer, signing himself 'K', drew attention to the 'unconventional tone' of the judgment which, he was sure, would receive 'admiring plaudits' from 'our youthful reformers'. Even more, it would be 'consecrated by the Hindu girls of the period as their charter of emancipation from the thralldom of matrimonial slavery'. But for the more orthodox it would be 'a matter of very grave reflection'.

That 'K' identified himself among the orthodox is suggested at this point by the mock sarcasm with which he describes them as "those old-world people who still cling to the superstition that Hindu society is not after all the whited sepulchre as it appears to their latter day prophets". Still he could not shrug off the reformers' concerns and the women's pain. Joining issue with Pinhey, 'K' made with impressive succinctness a point that Vicaji, Dadaji's counsel, had somewhat struggled to argue before Pinhey. If the marriage between Dadaji and Rukhmabai was considered not consummated, it was so 'according to the English notion of that act'. He illustrated the point with a hypothetical scenario: "If the husband had died the next year, the girl would have been pronounced a widow by the Hindu and English law, and would have all her rights and privileges secured to her". "But", he continued, "the Fates reserved a better destiny for the fortunate girl, and, being well-connected and well-befriended, she ventured to take advantage of the general advancement of the time and emancipate herself from the prevailing ignorance, which is the badge of her sisterhood, by seeking the protection of the high court against the suit filed by her husband to compel her to live with him". "This", 'K' stressed, 'cannot but redound to her credit'.

But, at the same time, 'K' interpreted Pinhey's judgment, with obvious anxiety, as establishing that a Hindu marriage – 'a solemn compact' to which the spouses plighted 'their faith before God and man' – could be legally broken. Condemning what seemed to him the basis of Pinhey's reasoning, he wrote:

That gentleman had nothing to allege against the validity of the marriage according to the Hindu law, nor anything against the conduct of the husband towards his wife. But because the wife was an enlightened woman and the husband an illiterate man, the kindhearted Judge had his imagination up in arms against the claims of the husband, and thinking that it would be like delivering up an ox or a bullock to a driver to order the woman to obey her husband, disallowed the claim and sent away the wife rejoicing.

The verdict, 'K' commented, did 'infinite credit to the Judge's heart', but not to his 'legal acumen'. A judge was 'always supposed to base his decisions on law'.

After this pious pronouncement, however, 'K' himself countered Pinhey's ruling with an extra-legal argument; an argument that was designed as a moral-cultural offensive. He alluded to Smollett's *Memoirs of a Lady of Quality* in which the second husband of a wayward lady rushes post-haste to consummate the marriage; and caustically added that, being illiterate, Dadaji did not have the advantage of such examples.²⁵ With this piece of sarcasm 'K' manoeuvred to implicate not only Pinhey's judgment but an entire people and their civilisation for whom, as he would have it, a physical act was the validating moment of something so sacrosanct as marriage. "In plain English", he wound up the argument, "the husband had not perpetrated 'a legalised rape' on his Hindu wife, and therefore an English Judge finds it in his wisdom to cut asunder the solemn connection of a holy wedlock".

Turning upside down the comment about equity and justice *vis-a-vis* law in the context of Pinhey's judgment, 'K' remarked: "Verily, if this is really a triumph of law, we doubt very much whether it would be considered a triumph of justice". Calling for strict adherence to law on the part of the judge, 'K' had appropriated justice for the cause of that Hindu orthodoxy with which he identified himself. And this after conceding that its humanitarianism was the one ground on which Pinhey's judgment appeared virtually unassailable.

'K' then referred to a case of restitution of conjugal rights which a Parsi woman had brought against her husband. The latter "demurred to the claim, on the ground, amongst others, that he had received a liberal education in India... and had, moreover, gone to England, passed his examination, and joined the Medical Service of Government and that he was moving in a respectable educated society, for which his wife was not a fit companion". The case was decided against the wife by Justice Tucker on the ground of domicile, as the wife lived in Bombay while the husband was a resident of the mofussil. But, 'K' emphasised, with regard to the plea of educational incompatibility "the Judge was plain-spoken to a degree, and virtually told the husband that he was bringing education into discredit and disgrace by availing himself of such an excuse for putting away his legally married wife".

Having cited what he thought was an appropriate precedent, and assuming that a similar incompatibility was the basis of Rukhmabai's defence and of Pinhey's decision, 'K' concluded on a note completely opposite to the one with which he had begun. After reminding the reader that the case mentioned by him was between Parsis, he lamented:

But in the present instance it is a Hindu wife who alleges the plea, and the benevolent quixotry of another Judge allows its validity

Such is the glorious uncertainty of English law! (*Indian Spectator*, September 27, 1885).

This was, perhaps, the most articulate expression of a mind that oscillated between the extreme positions with both of which it seemed to sympathise. Others, too, felt drawn in opposite directions; at times without being quite aware of their own vacillations. For example, the *Kaiser-i-Hind*, a Gujarati weekly from Bombay, was happy that Pinhey had by his judgment dealt a severe blow at the objectionable Hindu practice of infant marriage. But it also dreaded the prospect that, 'swayed by personal motives', the millions of Hindu girls married in their infancy 'may with impunity break the sacred matrimonial bond' (excerpt, *The Times of India*, September 28, 1885).

The alarm caused about the stability of family and society, it would seem, was wider than the spread of the type of Indian papers that were unrelenting in their criticism of the verdict. The appreciation of the emancipatory potential of Pinhey's judicial mediation was not always untouched by an apprehension of the risks to which it exposed domestic and social relations. This dual realisation²⁶ did not result in cultural withdrawal. Hence the happiness about Rukhmabai's emergence from ignorance and the invocation of Justice Tucker's censure of attempts to abuse means of progress, like education, for selfish personal ends and socially corrosive purposes.

It is possible that those who betrayed ambiguity, moving uneasily between approval and anxiety, constituted a very large section of the society. And the number of those who were ambivalent in this way belies the contention that disapproval was the sole Indian reaction to Pinhey's decision.

There was a more emphatic repudiation of the Anglo-Indian view of the Hindu/Indian response. It came from Indians who yielded to none in supporting the verdict; and their support rested on a better perception of the rationale behind the verdict. The *Indian Spectator* led the Indian defence of Pinhey's judgment. With an expeditiousness that spoke of his sense of urgency, Malabari despatched a signed note – something he rarely did – which appeared in the paper in the very next issue after the one carrying 'K's' comments. Recording his 'entire' disagreement with 'K', and addressing him as a 'correspondent' in an effort to dissociate the *Indian Spectator* from his views, Malabari described the judgment as 'sound in equity and not inconsistent with common sense'. Coming from a master polemicist and ardent champion of Rukhmabai's cause, this looked lukewarm. But, handicapped by the unavailability of the text of the judgment in Punjab – perhaps relying on the report in the *Civil and Military Gazette* of September 30 which mixed excerpts from the judgment with comments thereon – Malabari must have been

constrained by the need for discretion about the legality of the judgment.

He, rather, sought to salvage the situation by directing his attack on that 'mode of hunting down an unwilling wife' which in law was called restitution of conjugal rights. Prepared to concede, in theory, its legality in adult marriages, he considered its enforcement in cases of unconsummated infant marriage indefensible. In the absence of intelligent consent of the parties, these 'nominal' marriages were 'not binding even according to the Shastras'. Stressing the importance of consummation even from a shastric point of view, and borrowing an argument employed, as we shall see, by Raghunath Rao, Malabari observed: "The wife becomes of the same gotra, etc., with the husband after consummation".

Implicit in the description of infant marriages as nominal was a questioning of their validity. Malabari was going farther than Pinhey. He was actually doing what Pinhey never meant to do; the underlying logic of his judgment notwithstanding. Having questioned the validity of 'nominal' marriages, Malabari sensed his chance to strike at the related evil of enforced widowhood as well. Deriving from the shastras the conclusion that both the supporters and opponents of Pinhey were drawing from his verdict, he broached the issue: "It is a question whether she becomes widow according to the Shastras on the death of the nominal husband". He ended his note with the prayer: "I for one would devoutly pray that the judgment might be upheld on appeal, so as to remain a worthy precedent to open our eyes to the evils of the disastrous custom" (*Indian Spectator*, October 4, 1885).

In the same hurried despatch Malabari also mentioned, so fleetingly as to risk missing the reader's attention, what he would later develop into a powerful argument. Having described restitution of conjugal rights as 'hunting down an unwilling wife', he followed Pinhey to assert that this was an English practice. But owing to an error, which reflects the depth to which faith in the justice and humanity of the English had been internalised, what appeared in the *Indian Spectator* was the exact opposite. The sentence, instead, ran: "This mode of hunting down an unwilling wife is un-English". The compositor, we can imagine, could not possibly believe Malabari to mean 'English' in a context like this. It must have been an inadvertent slip on his part. And, as one taking pride in his thankless job and not doing it mindlessly, the compositor appears to have made the requisite correction, confident of earning the boss's gratitude for averting a politically embarrassing misprint. Little would he have expected to receive, rather, an explanatory correction for insertion in the following week's issue. It read:

In my paragraph on the Hindu lady's case, please read English for un-English. What I mean is that a barbaric relic of English law should not influence the administration of Indian laws (*Indian Spectator*, October 11, 1885).

Malabari's correction exuded a confidence that was missing in the previous week's misprinted reference to English law. There was reason for the confidence. Still without the text of Pinhey's judgment when he sent, from Anritsar on October 5, the correction and his second despatch on the case, Malabari had received a comforting opinion from an Englishman who had spent "nearly 20 years in India, both as Judge of a Presidency High Court, as well as a legal practitioner". The judgment, this 'highly respected English lawyer' believed, was 'sound and irreversible morally as well as legally'; even if it was not 'so exhaustive from the latter point of view'.

As against Malabari, who was nervously praying that the judgment be upheld, his English authority hoped that the rumour of appeal was not without foundation: "for the appeal will serve to keep up public interest in the question, and at the same time be the means of informing the public more fully on the subject". The appeal, he predicted, would "undoubtedly be dismissed on the ground that it is not, in fact or in law, a suit for restitution of conjugal rights, but a suit for specific performance of a marriage contract". He explicated his argument:

Now a mercantile or other contract may, as a general rule of law, be specifically enforced; in other words, a party injured by breach of a contract has his option to claim damages for the non-performance of it; or he may proceed to enforce the fulfilment of its terms in specie. But a marriage contract (being a contract *sui generis*) cannot be enforced specifically. Such is the invariable law of England, British India, America - in short, of every civilised nation (*Indian Spectator*, October 11, 1885).

Never in doubt about its morality, and now reassured about the legal strength of the case, Malabari was soon in his element as he sprang to defend Rukhmabai with full force. Combining his appeal to the shastras with an invocation of civilised laws in general, he developed the argument about the nominality of infant marriages to mount an offensive. It was 'distressing', he began, that Rukhmabai should be described by 'generally intelligent public writers' as the plaintiff's wife, because:

... the most essential part of the ceremony, according to the Hindu and all other civilised marriage laws, the consent of the parties, having been wanting, Rukhmabai is less the plaintiff's wife than I am his first cousin.

The mocking start soon developed into a moral outrage which resonated of Pinhey's

outburst, especially the one relating to horses and bullocks:

It would not perhaps be so wrong if our conservative friends described the connection as slave and slave-owner. In that capacity they might insist upon the slave being driven home to the owner, or rather the owner's uncle,²⁷ to be suffocated, dismembered and offered up on the altar of Custom.

As if realising, at the height of this burning rage, his own helplessness to alleviate the sufferings he saw all around, sufferings that Rukhmabai appeared to embody so much the more for the threat to her legal victory, Malabari cried from the depth of his heart:

Just fancy the little rebel delivered into the hands of Dadaji Bhikhaji, his uncles, aunts, sisters and cousins. It makes one's blood curdle only to think of the outrage. If I had a child in that predicament, I would far rather she died before my eyes.

This is not a propagandist's hyperbole. What he had seen, since his own sad childhood, of the cheerless existence of daughters-in-law in the joint families of the day, was reason enough for Malabari to fear for the little rebel.²⁸ Hence, the allusion to the combine of uncles, aunts, sisters and cousins who often made life more miserable for the woman than did her husband. Besides, he well knew the sinister Narayan Dhurmaji who headed the household in which, if ordered by the law court, Rukhmabai would be required to live.

Malabari wasted no sympathy in dealing with those whom he called orthodox Hindus. For them he had only ridicule and anger. He preferred to meet them on their own ground. He joined issue with a 'usually sensible and impartial' writer who had chided Rukhmabai, as Malabari characteristically put it, 'for disowning her husband in name' because he had become poor and diseased. This 'preacher' had waxed eloquent on 'the wifely sacrifices' of Damayanti, and advised Rukhmabai to follow the example of her famed mythological progenitor. A man of faith, Malabari confessed that he was a great admirer of Damayanti and believed her story to be true. "But", he countered, "we cannot expect every Hindu girl to be a Damayanti in this Kali-yuga." He did not, in saying this, derogate the Hindu women of his day.²⁹ Rather, he turned the argument against the orthodox and the system they upheld:

For, they are never tired of assuring us that Manu and the other wise law-makers ordained the present rigid injustice against women, because they knew women would be dangerous enemies of society in the Kali-yuga, if treated like human beings.

The problem, Malabari countered, was not that the quality of womanhood had declined over the centuries, but that the system of injustice had produced results contrary to those expected of it. Pointing to the contrast

between Rukhmabai and her 'ancient prototype', he dilated on the differential working of the two systems:

Damayanti accepted the husband of her choice, when she was old enough to exercise her judgment. Rukhmabai never lived with her husband since the sham marriage, did not know him, had no opportunity of studying his character. Damayanti became Nala Raja's wife, in fact, loved him with a woman's whole love... Rukhmabai's nominal husband is said to have gone to the bad, ruining his mind and body for ever

"What right", in a situation like this, "have we, as honest observers, to ask Rukhmabai to follow the example of Damayanti?" Malabari answered the question with a warning: "But even if worse came to the worst, no law or authority can make Damayantis of nominal Hindu wives".

He followed this up with his favourite strategy of reversing the case to expose the role of gender in this systemic injustice; a strategy that Rukhmabai also used effectively in the letters of 'A Hindu Lady'. He invited his readers to suppose that, instead of her husband, Rukhmabai 'herself had turned out incurably diseased and unacceptable', and completed the scenario:

What would the husband and his friends have done? Why, they would have discarded the wife like a burnt stick, and supplanted her with one or more new wives.

They were galled because, for once, the wife had the best of the bargain; though they should have remembered that even this was 'a bargain struck without her knowledge or consent'. Because she, and not the husband, was educated and endowed with a little fortune, it seemed essential to bring her under.

Bolstered as it was by a structure of traditionally transmitted values with their ultimate sanction in religion, the system of injustice was oppressive enough on its own. What the adversaries of Rukhmabai were attempting was to 'put the machinery of law into motion' in order to 'smother her religiously'. Taking exception to such utilisation of law, Malabari wrote with angry disdain: "How pious and chivalrous they are who sermonise upon the story of Nala Damayanti!"

Knowing, as he did, the intimate details of the dispute and the actants therein, Malabari let it be known to his readers that the prime villain in the case was not Rukhmabai's husband. The 'discredited husband', he believed, was urged, 'against his wishes, to destroy her life's happiness.' The man who invisibly directed this murky drama was Dadaji's uncle, a vicious man whom Rukhmabai 'naturally dreads with a mortal dread'.

Assured by the English authority of the soundness of Rukhmabai's case, and still praying 'hourly' that Pinhey's judgment was upheld and 'dignified into a salutary

precedent', Malabari discovered yet another ground for optimism. 'At any rate', he told himself and others. "I trust that no Englishman will be guilty of betraying the poor lamb into what may prove perhaps worse than a slaughter-house" (*Indian Spectator*, November 1, 1885).

In less than six months the fate of these and opposite prayers, hopes and expectations was provisionally settled when the appellate court set aside Pinhey's verdict. The law of British India took another year after that to order Rukhmabai to go to her husband or else face the risk of imprisonment for six months.¹⁰ The brave young woman let it be known, at a time when passive resistance and satyagraha lay away in future, that she would rather submit herself to the maximum penalty admissible under the law than obey the court's verdict. Even the viceroi was rattled. "I hope", he wired his law member, "you are keeping your eye on the Rukhmabai case. It will never do to allow her to be put into prison".¹¹ And organised Hindu orthodoxy considered it discreet to hail the court's verdict as a vindication of Hindu marriage; afraid of Rukhmabai's martyrdom, it advised Dadaji not to press for her imprisonment on ground of contumacy.

The battle that had begun with Pinhey's judgment was this time renewed with aggravated stidency. But that is a later phase of this social drama with which we cannot deal here. Clearly, the society was deeply divided over a woman's awareness and assertion of the inviolability of her person. Even before the drama had unfolded fully, the *Bombay Chronicle* had predicted a serious clash of opposing social forces. While its Anglo-Indian 'brothers' continued to believe that the Indian reaction was one of opposition to Pinhey's verdict, the *Chronicle* expected 'strong forces' to be 'arrayed on the different sides' so that:¹²

The battle will be one of tremendous consequences to the social institution of the Hindus, and will draw in the arena of the fight some of the best intellects of the race.

What we need to remember is that in this battle some of the finest orthodox Hindu intellects stood behind Rukhmabai and supported Pinhey's judgment in her favour. In the appellate court Telang's entire defence of Rukhmabai rested on an exegesis of Hindu law. The self-consciously conservative Hindu in him had grasped the profound socio-cultural significance of this case, and he was keen to offer through his defence of Rukhmabai what he thought was the true Hindu law with regard to conjugal relations.

Similarly, Dewan Bahadur R Raghunath Rao, whose orthodoxy no one could have had the hardihood to question, offered a shastric defence that even Pinhey, despite his conviction that the kind of suit filed by Dadaji did not lie in Hindu law, could not have anticipated. Radicalising the very

concept of Hindu marriage, the Dewan Bahadur argued: "As in all contracts, so in a Hindu marriage contract are consent and consummation the requisite elements". Hindu law, he contended, prohibited consummation during the first three days of the marriage. The bride became of the bridegroom's *gotra*, *pinda* and *sutaka* – and this was his decisive evidence – after 'actual personal consummation on the fourth night or thereafter' (*Indu Prakash*, October 26, 1885).

This was a powerful argument that anticipated, and neutralised, the most obvious and common argument against Pinhey's judgment; which was that in imagining consummation as essential to the institution of conjugal rights, he had brought in an alien notion and disregarded the fact that the rights of the husband and the wife were complete the moment the Hindu marriage ceremony was performed.

It is true that, both in terms of general acceptance by the caste Hindu society and the view taken by the higher British Indian judiciary, the progressive exegesis of Hindu law and practice offered by the likes of Telang and Raghunath Rao lost out to reactionary and constricted interpretations. That, however, cannot be a reason for taking the latter as the real Hindu law and practice. Which is what the ruling people's view of the Rukhmabai case generally tended to be after Pinhey's judgment was set aside. In a characteristic fit of collective superiority and resultant blindness for inconvenient details, the very people who had earlier celebrated Pinhey's verdict now sympathised with the judges, all Englishmen, who reversed that verdict. These helpless judges, it was now maintained, 'unhappily, had no alternative', bound as they were by their *oath to administer the Hindoo laws*' (emphasis added).¹³ Suddenly, and completely, they forgot Pinhey's categorical demonstration of two crucial facts: that such restitution suits did not lie in Hindu law; and that what the courts administered in such cases was a discredited English law.

Such, ironically, is the hold of the belief in the progressive role of the colonial legal mediation in India, that in our own day, too, Rukhmabai continues to be seen as a victim of Hindu law. This is neither to debunk the colonial legal mediation *per se*, nor to idealise Hindu law. Both need to be problematised. For it was the misogyny of Hindu socio-domestic reality buttressed by the misogyny of English jurisprudence that created the situation in which Rukhmabai struck for her rights as a person and offered herself as a martyr to the cause of her Indian sisters. A detailed analysis of the rival arguments in her case, the conflicting judicial decisions, and the wide spectrum of public responses in India and England offers a chance to critique, in terms of what they did to/for women, the deadly dialectic of the 'tradi-

tional' socio-cultural and the colonial legal systems.¹⁴

Notes

[This paper is based on parts of a book-length study of the Rukhmabai case. Tentatively titled *The Brutal Embrace: The Debate on a Woman's Rights in Colonial India*, the first draft of the study is over. Of the many debts incurred during this study, I particularly wish to acknowledge two here. Research for this work in England was made possible by the Charles Wallace (India) Trust, and in India mainly by the Indian Council of Historical Research. To these organisations, and to R E Cavaliero and Irfan Habib who facilitated these grants, I am immensely grateful.]

1 'A Hindu lady' was no other than Rukhmabai. This was her second letter on the subject, the first one having appeared on June 26, 1885. The timing of the letter was clearly meant to coincide with the hearing in the case, and it seems to have had the desired effect on Pinhey. The editor of *The Times of India* at this time was Henry Curwen. A man with some literary pretensions and a grandson of Wordsworth, Curwen was taking personal interest in Rukhmabai's case.

8 While Rukhmabai was from the outset conscious of the larger issues in this case, even Dadaji, it may be noted, presented himself in his *Exposition*, as one fighting for the sanctity of Hindu marriage and family. For example, he wrote: "If religious pledges are to go for nothing, then where does morality begin? It is both a precept and a divine law to the Hindus that it is a wicked and an undutiful act on the part of girls or women to form matrimonial connections without the consent of their parents or relatives. Non-Hindus do not understand this matter; it has formed no part of their religious training; but to a Hindu it is at once conscience, reason, and religion. No censure which non-Hindus may apply to the system, no ridicule which they can throw upon it, can change the faith in this doctrine of the Hindu who values his religion. The true Hindu will suffer martyrdom for it. I appeal with boldness to all my co-religionists, for they alone can understand my feelings and the power of the doctrine which I have endeavoured to explain." (p 10).

9 The 'orthodox party' in Bombay collected funds and offered considerable assistance to Dadaji soon after Pinhey's judgment so that

- he could appeal against it. This move was master-minded by V N Mandlik who secured a one-line appeal for funds from Dadaji and circulated it among the circle of his friends. See Ganesh Ramkrishna Havaladar, *Rao Saheb Vishwanath Narayan Mandlik Yanche Charitra* (in Marathi), Mumbai, 1927, Vol II, pp 860-61.
- 10 *Bombay Gazette*, October 5, 6, 1885 In 1887, following appeal against Pinhey's verdict, when Rukhnabai was threatened with the prospect of imprisonment because of her refusal to obey the court's verdict, the *Gazette* became one of her most powerful supporters.

 - 13 *Civil and Military Gazette*, September 28, 1885. Rukhnabai was the stepdaughter of Sakharain Arjun.
 - 14 *Indian Daily News*, September 29, 1885, *The Times of India*, October 2, 1885, reproduced this from the *News*.
 - 15 V N Mandlik, *Vyavahar Mayukha or Hindu Law*, New Delhi (reprint), 1982. First published in 1880. Founded by him in 1864, the *Native Opinion* continued to be edited by Mandlik until 1871. His influence over the weekly, however, never waned. It was particularly marked during the Rukhmabai case controversy.
 - 16 Noticing Telang's now famous lecture, 'Must Social Reform Precede Political Reform', Mandlik noted with satisfaction "the learned lecturer tried to show that though reform may be necessary in social matters as well as in our political situation, it is the political reform to which our energies should be directed in the first instance." And further: "...the lecturer's conclusion is the one which we had arrived at when this journal was started and which was adopted and has been adhered to as the governing policy of this paper", *Native Opinion*, February 28, 1886.
 - 17 Ganesh L. Chandavarkar, *A Wrestling Soul: Story of the Life of Sir Narayan Chandavarkar*, Bombay, nd, pp 79-80.
 - 18 *Indian Spectator*, December 18, 1887 Referring to the Madhavbag meeting where, under Mandlik's chairmanship, a radically anti-social reform position was taken, and even the sober Telang was shouted down, the *Spectator* wrote: "The sin of the Madhavbag meeting will stick to this aged pleader, and he will have to account for it to a higher tribunal than to the public of Bombay. We would never have said a word against him even in this connection had he acted from conviction; but we must decline to believe that a man of Mr Mandlik's intelligence could conscientiously favour the views enunciated at that meeting of illiterate Banias and Bhattias."
 - 19 H Moore's *Indian Appeals*, 558-61.
 - 20 This assertion was placed in its proper perspective by Latham and Telang, especially the latter, when they defended Rukhmabai in the appellate court. I have discussed this briefly in my 'Whose Laws? Notes on a Legitimising Myth of the Colonial Indian State', *Studies in History*, 8, 2, ns (1992), pp 192-94, *passim*.
 - 21 *Native Opinion*, September 27, 1885. The fear of subversion is further reflected in the *Opinion's* angry outburst, in its issue of October 11, 1885, against the *Sind Times* for taking a favourable view of Pinhey's judgment: 'Why not seek to establish a system of divorce instead?'
 - 22 To the extent it continues to be remembered, and as part of an Indian feminist consciousness that is discovering its illustrious genealogy, the Rukhmabai case remains more of an unresearched legend. As invariably happens in such situations, the facts and the significance of the case, and the role of certain characters involved therein, tend to be overstated. Thus, in the inaugural issue of the *Indian Journal of Gender Studies* (January-June 1994) which, appropriately enough, opens with a paper on the 19th century triumvirate of Pandita Ramabai, Rukhmabai and Anandibai Joshi, Meera Kosambi describes the Rukhmabai case as the first ever divorce case in India. She also tells us that, following a compromise verdict in the case, Rukhmabai's marriage with Dadaji was dissolved. It was not a divorce case and the marriage was never dissolved. For, as Rukhnabai herself put it with unconcealed anguish - as Latham had earlier done before the appellate court - the Hindu woman, once married, was tied for life. Marriage for her, in Malabari's burning phrase, meant a 'brutal embrace'. Similarly, keeping up a tradition in which Pinhey's judgment was generally misunderstood by its supporters as well as critics, Kosambi says that an 'additional argument' employed by the judge was that Rukhmabai's 'marriage had been performed in her childhood and without her choice'.
 - 23 Here Rukhnabai is getting carried away, if she is not making a polemical point. She could not possibly have forgotten the marriage of her own widowed mother with Sakharain Arjun.
 - 24 Reproduced in *Civil and Military Gazette*, October 6, 1885. Just to get an idea of rhetorical differentiation in the articulation of the same point, we may consider the following from this letter: "The poor and the rich are equal in the eye of the law, and the mere facts of the failing health of the plaintiff and his inability to maintain his wife on a liberal scale, incommensurate with his limited resources, certainly do not deprive him of his rights... the mere dismissal of the plaint on grounds of poverty and sickness of the plaintiff, and the dislike of the lady for her husband, is likely to produce mischievous results in future. Hence the judgment, if not reversed on appeal, will set up a mischievous precedent for other proud aristocratic ladies to desert their husbands because they are poor."
 - 25 'K' seems to have forgotten the exact details of the story he was referring to. The lady was an innocent wench of 15 when her first husband insisted on making love to her after they had run away to a remote place. Afraid that irate with their 'stolen' marriage, the lady's father would track them down, the husband was obviously in no mood to oblige his father-in-law with any chances. As the protagonist-narrator put it:
... the bridegroom gave me to understand, that there was a necessity for our being bedded immediately, in order to render the marriage binding, lest my father should discover and part us before consummation. I pleaded hard for a respite till the evening, objecting to the indecency of going to bed before noon; but he found means to invalidate all my arguments. (Tobias Smollett, *The Adventures of Peregrine Pickle*, London, 1930, Vol II, p 41)
 - 26 *Gujarati*, an Anglo-Gujarati weekly started in 1880 to champion the cause of Hindu orthodoxy, observed that Pinhey's 'revolutionary' judgment was a double-edged weapon.
 - 27 This refers to Narayan Dhurnaji, Dadaji's maternal uncle and an unscrupulous manipulator, who had master-minded the very idea of litigation.
 - 28 Here is a random reading list for those who wish to be acquainted with contemporary accounts of the existential reality within the Hindu joint family. The list includes fiction, diary and reminiscences. G M Tripathi, *Sarasvatichandra* (the four volumes of this first major novel in Gujarati came out between 1887 and 1901), Mumbai, 1985; Kantilal C Pandya and others (eds), *Govardhanram Madhavram Tripathi's Scrap Book*, Bombay, 3 vols, 1957, 1959, *Ranade: His Wife's Reminiscences*, English translation (from Marathi) by Kusumavati Deshpande, New Delhi, 1969; Hari Narayan Apte, *Pan Lakshyanti Kon Ghetu* (Marathi novel which appeared in 1890), Hindi translation, entitled *Kaun Dhyani Deta Hai* by Srinivas Kochkar, New Delhi, 1961. I have discussed this in my *The Oppressive Present: Literature and Social Consciousness in Colonial India*, New Delhi, 1992 (reprint 1994), pp 74-82.
 - 29 Malabari is exceptional in the turn he gave to the argument about 'Kali-yuga'. Usually the argument rested on an initial admission of the degeneration that had come about in the character of women, as of men, so that they were no longer capable of living up to the ideals of old. For example, even the most committed advocates of widow marriage argued that since Hindu women were unable to lead a life of austerity and celibacy after losing their husbands, and often fell into evil ways, causing such problems as foeticide and infanticide, it was much better to let them have the option of remarriage. This is precisely the logic why the *Parashar Samhita*, with its less rigorous code of conduct, is considered the authoritative shastric text for Kali-yuga.
 - 30 In the paper cited above Meera Kosambi says that 'notice was served on Rukhmabai to join her husband or undergo six months' imprisonment'. What the judge, Farran, did was to order Rukhnabai to 'go or return' - the wording took care of Dadaji's prayer for the institution or restitution of his conjugal rights - to her husband's house within one month and inform the court accordingly. There was no mention, and legally could not have been, of the punishment that might follow, if the husband so petitioned, on ground of contumacy. No such notice was ever served. Apart from the organised Hindu orthodoxy's anxiety not to make Rukhmabai a martyr, her influential Indian and European friends and supporters, who had formed the Rukhnabai Defence Committee with a view to taking her case to the Privy Council, had pre-empted the possibility of her imprisonment by taking the case once again to the appellate bench in appeal against Farran's order.
 - 31 *Home Department, Judicial Proceedings*, June 1887, Nos 189-92 (National Archives of India).
 - 32 *Bombay Gazette*, excerpted in *The Times of India*, September 28, 1885.
 - 33 Taking its cue from the *London Times*, the *Queen*, a leading women's magazine wrote this in its issue of March 19, 1887 after Justice Farran, in deference to the appellate court's reversal of Pinhey's verdict, had ordered Rukhnabai to go to her husband.
 - 34 May I leave the reader here with the assurance that *The Brutal Embrace* seeks, among other things, to provide a narrative that critiques both.

Urban Local Government in Pakistan

Expecting Too Much from Too Little?

S Akbar Zaidi

This paper examines the developmentalist performance of urban local government in Pakistan and shows how, over time, democratically elected local governments have been made impotent by democratically elected members to the higher, provincial and national assemblies. While extensive legislation exists which could permit the effective role of local government in development, severe financial constraints faced by these governments have meant that they are no longer involved in the process of development. Unless substantial structural measures are taken, in which the role of local government is redefined, it is unlikely that development at the local level will take place.

THE cliché-ridden 'new world order' is said to have had its beginnings in the mid-1980s following Mikhail Gorbachev's 'perestroika' in the then Soviet Union, finding its crystallisation with the fall of the Berlin wall in 1989. It is the triumph of the west and the 'end of history', in which we are told, the 'new age' is one of the free man and woman, unencumbered by domination by the state, and freedom of choice and action are now set to dominate economic and political thinking [Banuri 1991; Zaman 1993; Zaidi 1994a, 1994b]. This is the era in which the neo-liberal synthesis has found its expression in economics and politics. Market-friendliness, privatisation, deregulation, devolution and democracy, are now the key clichés which form the mix (and fix) for societies which were hitherto deviant from the norm adhered to in the west. With the demise of the bipolar world, the unipolar world now sees itself as an elongated extension of the west to the non-west. The measuring rod for success and achievement is now the ability to ape developed western countries in order to make development 'sustainable' [Zaman 1993]. Governance, democracy and devolution form a critical union to make development sustainable and are said to manifest the key prerequisites for progress [Lettwich 1993].

With the breakdown of the command economies of the former Soviet regime and its allies, devolution of control and power has been seen as means for greater participation of people and hence progress [Zaidi 1994a]. Today huge centralised government machineries which were deemed competent and capable of delivering on promises to their people have floundered. The new thinking has shifted away from the central and federal governments' role in developing the economy and society and has begun to incorporate the private sector and non-governmental organisations as important key actors in development strategies. Furthermore, the need for less bureaucracy, more efficient and timely delivery of services, and closer and more direct access to the beneficiaries of development related projects, have also been important considerations in

this shift in thinking and strategy. Not only has there been a move away from the role and control of government – the withering-away-of-the-state thesis – there has also been a noticeable shift *within* government structures. There is agreement now that strong centralised states are out of tune with the reality on the ground, and thus there has been a growing need and demand for more active participation and hence *devolution*. The controlling federal/central state has been forced to extend more powers to smaller units at the provincial, district, and local levels so as to enable these units to play an active role in providing welfare to the people. More autonomy has been granted to provincial and state governments, and local municipal government has also been expected to play an increasingly prominent role. While the world climate has been the critical factor in causing this shift of emphasis [Zaidi 1994a], the economic constraints faced by many, if not most, underdeveloped countries, have helped accentuate this shift. Many third world governments find themselves in dire financial straits and are forced to cut public expenditure in order to cut the budget deficit and restructure their economies. Structural adjustment is the single most important phrase which acts as a metaphor for the state of the economy in most underdeveloped countries [Zaidi 1994b]. Budget cuts – an essential ingredient of any structural adjustment programme – have meant that central/federal governments have had fewer funds to make available to lower echelons in the hierarchy. Thus, provincial and local governments which were dependent on the state have now had to become more disciplined financially and have seen their grants and aid cut. It is this dual shift – a resource constraint faced by the federal government, and the belief that more participation and devolution of power and control leads to better, more effective, and sustainable development – that has brought local governments into the forum of development planning.

How and where can urban local governments in Pakistan play a prominent role in development, and why are they, given their existing structure, failures at doing so?

STRUCTURE OF LOCAL MUNICIPAL GOVERNMENT¹

Pakistan is a federation in which the affairs of government are guided by the Constitution of Pakistan of 1973, with all amendments. In the constitution the allocations of the functions of the federal and provincial governments are clearly specified. There are some functions which are the exclusive responsibility of the federal government, while others according to the constitution can either be performed by the federal or by provincial governments. The existence of local governments is not formally embodied in the constitution. Local governments in Pakistan exist under the supervision of the various provincial governments, where provincial governments have merely delegated some of their functions and responsibilities to local governments by the promulgations of ordinances. The Local Government Ordinance of 1979, with its amendments, is in operation in Punjab, Sindh and the NWFP, while Baluchistan's local governments are under the 1980 ordinance. These ordinances specify the allocation of residuary functions of local governments [AERC 1990h].

Before we briefly examine the history of local governments in Pakistan, and then turn to the existing statutory, organisational, and managerial structure of municipal local governments, it is important to emphasise the point that at present elected local governments exist only in the sparsely populated province of Baluchistan. Other local governments stand dissolved. In the NWFP, all local bodies were dissolved in 1991, in Sindh in 1992, and in the Punjab in August 1993. Different reasons exist as to why the provincial governments dissolved the local governments in their own provinces. In the case of NWFP, mismanagement and corruption were cited as reasons, while the Punjab provincial government dissolved its local governments in order to ensure that national elections held in October 1993 were not influenced by incumbent local government officials. Thus, in the absence of democratically elected local government officials in the rural and urban areas, town

committees, municipal committees, and municipal corporations are all being run by administrators who are members of either the federal or provincial public (civil) service cadre. Administrators are appointed by the provincial government and are transferred between different posts for unspecified duration of tenure.

BRIEF HISTORY OF LOCAL GOVERNMENTS IN PAKISTAN²

Local governments have existed in the Indian subcontinent for many centuries, with the first municipal corporation set up in Madras in 1688 by the East India Company. In 1842, the Conservancy Act which led to the formation of sanitary committees for garbage disposal became the first formal measure of municipal organisation which applied to the Bengal presidency. In Karachi, the board of conservancy was established in 1846, while in Lahore and Rawalpindi, the Municipal Act was passed in 1867. Subsequently, Lord Ripon's resolution on local self-government in 1882 allowed for the provision of some elected members in municipal committees and proposed the establishment of rural local governments. The 1907 Decentralisation Commission recommended the appointment of non-official chairman of municipal committees, a recommendation which was endorsed and extended further by the 1925 Simon Commission set up to assess the performance of local self-government. The 1935 Government of India Act allowed provincial autonomy and permitted provinces to frame legislation on local government systems.

In 1947 the areas that constituted Pakistan had few developed systems of local government, and they were confined mainly to the Punjab. Wherever local government existed, it was not based on adult franchise, and the agenda and budget were under severe bureaucratic control in which the deputy commissioner played a critical role in determining policy. The period 1958 to 1969, which saw Pakistan's first martial law and military government, also saw the development of an extensive *elected* system of local government. The military government after disbanding the provincial and national governments realised that there was a need for at least a semblance of involvement of the people in their own affairs. This gave rise to the basic democracies system which set up a new local government system across the country through which members were elected.

The basic democracies system was seen as a substitute for universal suffrage where it served as an electoral college to elect the president and the assemblies. However, with the fall of the Ayub Khan regime with which it was closely associated, it fell into disfavour. Besides, the first general elections of 1970 and the separation of the then East Pakistan from Pakistan resulted in the formation of

an altogether new system of government in the country. Ironically though, the proposed elections to be held under the People's Local Government Ordinance of 1975, promulgated by Pakistan's first democratically elected government to elect town and municipal committees (as well as councils in the rural area), were never held.

If the first martial law government was the pioneer in devising an extensive system of local governments, it was the second martial law regime of General Zia which implemented the principle of elected local governments, which were revived in 1979 under the provincial local government ordinances, which, with amendments, are still in operation in Pakistan. Elections for local councillors have been held on a non-party basis in 1979, 1983 and 1987.

The period since 1985 has seen four general elections held in Pakistan in which the people were asked to choose members of the provincial and national assemblies. In the absence of elected assemblies, local governments were the only popularly elected bodies and thus played important political and developmental roles. After the election of senators and members of the provincial and national assemblies, the role of local governments has been substantially marginalised. These elected representatives have taken over some functions which local governments used to perform. Specific federal and provincial level programmes, which were directed at elected provincial and federal members of parliament, such as the Five-Point Programme of the Junjo government (1985-1988), the People's Programme of the first Benazir Bhutto government, and other such programmes, have in many ways intervened in the evolution of proper and improved local government. Under the abovenamed programmes, elected members of provincial and national assemblies were given considerable funds which they could use for development projects, largely on their own discretion, in their political constituency. This has severely undermined the role local governments have been playing, and can play, in the development of particular (local) areas and regions. Furthermore, the fact that the elected principle of local bodies has been in abeyance, reflects on the attitude of elected and non-elected government officials. There seems to be an inherent conflict of interest between different tiers of government, in which local governments, because they are assumed to be the most expendable, have borne the brunt.

An analysis of the attitude of different leaders and their governments towards local governments shows that those governments which were more autocratic – Ayub Khan and Zia ul-Haq – did more for participation at the local level than have democratic governments. Military dictators needed to legitimise their existence at some level, and they used local bodies for this purpose.

Further, ironically, local governments performed far better as local governments under the dictators than they have otherwise. In fact, it seems that democratically elected national and provincial members of parliament recognise this fact and have subverted the participatory process at the lowest level. There is a further irony in the fact that a large number of those who have been elected as members of the national and provincial governments emerged as politicians in local body elections.

LEGISLATIVE PROVISIONS OF MUNICIPAL GOVERNMENTS

The Local Government Ordinance specifies two sets of functions to be performed by municipal governments. The differentiation between the two sets is between compulsory and optional functions. For the most part, most of the sets of functions for local governments in different provinces are more or less the same. There is further differentiation between functions of a regulatory nature and those that relate to the provision of services.

For the three larger provinces, a common list for all urban councils containing compulsory and optional functions exists. Thus town committees, municipal committees, municipal corporations and metropolitan corporations are supposed to perform the same functions. Due to the lower extent of urbanisation in Baluchistan, a smaller list of functions exists for town committees. Municipal governments are responsible for the provision of sanitation, the removal and collection of garbage, the provision of water supply and drainage and sewerage, and other town planning and town developing activities, all of which are part of their compulsory functions. The establishment of educational institutions is also a compulsory activity. Amongst the optional functions which municipal governments could perform which could affect development are the following: the establishment of child and maternity health centres; the establishment of hospitals and dispensaries; some additional general provisions for education; the maintenance of gardens and parks; and the establishment of social welfare institutions.

Municipal status is primarily a function of population. Urban settlements with populations ranging from 5,000 to 30,000 are generally designated as town committees. Municipal committees have populations up to 2,50,000. Cities beyond that size and provincial capital have either municipal or metropolitan corporation status. Property tax rating areas generally extend to the municipal committees and the larger town committees. The status of local government functionaries is directly correlated with the municipal status of the particular jurisdiction. At present there are two metropolitan corporations, 12 municipal corporations, 146 municipal

committees, and 336 town committees functioning in Pakistan.

In urban areas the four types of municipal committees have organisational setups which are more or less similar across the provinces. Despite the fact that urban union councils, from the town committee to the municipal corporations, may be one-hundredth the size of the larger corporations, there are very clear similarities in organisational structure. There are always three sections or departments comprising general administration, finance, and engineering. Town committees have just these three departments which grow in size and qualitative specialisation as the size of the urban area increases, i.e., when it is represented by a municipal committee or corporation. Municipal committees and corporations are also very similar in the nature of their organisational structure, and both have two additional departments, viz., education and health. Furthermore, the accounts department consists of two separate units, one for finance and the other for taxation.

The two metropolitan corporations of Lahore (pop five million) and Karachi (pop 10 million) by virtue of their size have much more diverse and extensive organisational structures. For example, given the extensive nature of types of works which are to be performed in metropolitan areas, there is a need for additional departments which perform specialised functions pertaining to legal affairs, land management and development, etc. The larger municipal corporations in the country, along with the two metropolitan corporations, also have development authorities functioning as parallel organisations within the cities. However, while the urban local councils perform more service related functions, the development authorities are more involved with engineering works and with urban and town planning as well as traffic related issues [AERC 1993].

MUNICIPAL FINANCES

The entire revenue of all local governments – rural and urban – form a mere 5 per cent of revenue generated by the different tiers of government, with the federal government earning close to 89 per cent and the remaining being generated by the provincial governments. Over time, the share of revenue generated by local governments has been rising, albeit marginally, while that of provincial governments has fallen. The local governments have collectively been able to show a better fiscal effort in terms of tax and non-tax revenue generation in the last 10 years. Nevertheless, as a share of all revenues generated the contribution of local governments is very small [see AERC 1990a, 1990b, 1991, 1992a, 1992b].

As far as expenditure is concerned, local governments spend only about 4 per cent of

the total expenditure of all forms of government in the country. This relative amount has fallen over the last decade. As far as recurring expenditure is concerned, local governments spend a much larger share on establishment costs, as 10 per cent of all expenditure on general administration in the country is by local governments. Of the recurring expenditure on the social services in the country, provincial governments spend the largest share since education and health are provincial concerns. Local governments contribute 10 per cent to the establishment costs of social services [AERC 1990b, 1992b].

Over time the federal government has shifted its contribution on the development side to the provincial and local governments, hence causing both to contribute more over the last 10 years. Thus, in 1979-80 provincial governments were incurring a share in total development expenditure in the country of about 18 per cent; this rose to 29 per cent in 1985-86. Similarly, in the same period local governments increased their share from 3 per cent to about 6 per cent [AERC 1990b, 1991; Ghauri and Pasha 1994]. However, at present, given the resource constraint faced by all tiers of government, many local governments have been forced to put a moratorium on all development related projects [Zaidi 1994a].

Since local governments come under the jurisdiction of provincial governments, their right to levy taxes is also subject to the directives of the latter. Local governments assist the provincial governments in the collection of revenue, and thus provincial governments have delegated the right of the collection of a vast number of taxes to local governments, as indicated in the Local Government Ordinance of 1979.

RESOURCE BASE OF MUNICIPAL GOVERNMENTS¹

The Local Government Ordinance prescribes the various sources of revenue to which local governments have access. As a whole, in urban areas taxes form about 60 per cent of revenue, while the remainder accrues from non-tax sources. The single source of revenue for urban councils is the octroi tax which accounts for in excess of 50 per cent of revenue. This is more significant for larger corporations, while the share falls as the size of the urban council decreases. This pattern is not unexpected, since this is based on goods being brought into council areas. In highly developed areas with a larger consumer base, and in areas producing industrial goods, more goods are imported and consumed, hence the higher share of the tax.

Property related taxes, such as the urban immovable property tax and the tax on the transfer of property, constitute the next largest source of revenue, together about 10 per cent. Again, property related taxes yield higher revenues in the larger cities such as metropolitan and municipal corporations. The smaller urban councils depend on non-tax receipts more than do the larger councils. Licences, fees and other non-tax receipts constitute a far greater share in smaller towns/cities than in large ones.

The octroi tax, which forms the largest single source of revenue of all urban local governments, is imposed on all goods imported into the municipal limits whether goods are consumed by households or used in industry. Octroi posts exist at all the entry points in a city. Up until a few years ago, local governments had their own staff in the taxation department collect this tax, but now

the tax is collected by contractors who bid in an open auction. A certain minimum amount is pledged by these contractors who reap the benefits above the guaranteed minimum. There are 18 classes of articles on which the tax is levied, with more than 225 taxable items in all. Rates vary from city to city, but in general there is not much variation amongst cities. Rates on food items vary less than on non-food items. Smaller cities have a larger food share in their octroi composition, while in larger cities the octroi is more broad based.

The urban immovable property tax is collected from all land and buildings within the municipal area which have been declared as rating areas and is paid by the owners of these properties. The tax imposed on such property is the actual annual rent in the case of buildings which are rented, and estimated rent in owner-occupied dwellings. The annual rental value is determined by estimating the gross annual rent at which such land or building can be let. The tax then calculated on this property is derived by making an allowance of up to 20 per cent of the gross annual rent for furnishing and 10 per cent for repairs. For those buildings which house their owners, similar rented dwellings are used as proxies. Legislative regulations require properties to be reassessed every five years. However, the last reassessment in the NWFP was in 1982, in which a minimal 5-10 per cent increase in value was undertaken, while urban property was reassessed in Baluchistan in 1985. In the province of Sindh the last actual assessment of property was made 25 years ago, in 1968.

The only tax levied by both urban and rural councils is the tax on transfer of property, which is levied at the time of sale of immovable property. The assessment is based on the total value of the property at the time of the transfer.

The water rate is a tax levied by urban local governments in the form of a user charge, but the rate is not dependent on the level of consumption of water and is in almost all, especially domestic, cases charged as a flat rate, or as an estimate based on plot size or rental value. This is especially so in the case of municipal and town committees, while larger corporations link the water rate to ferrule size. Water rates are often not increased as there is a fear that there will be political reaction against such measures. Only 40 per cent of urban councils increased their rates in the 1980s. On average, the increase in rates has been of the order of almost 60 per cent. Since very few urban local councils have been able to increase their rates, and with the substantially increasing costs to finance water supply schemes, the result has been that the costs in provision of water have outstripped the revenue being generated by the water rate. Because of this, local governments have not even been able to

generate funds to cover their (increasing) operation and maintenance costs. The average for recovery of recurring cost is less than 50 per cent. The reasons recovery is so low is the existing very low rates on water usage, fixed or constant rates which are not commensurate with size, and the low collection efficiency on water rates [AERC 1990b, 1992b, 1993].

At present almost 70 per cent of the revenue collected by urban councils accrues from private contractors – essentially because of octroi. The process of privatisation of taxes began in the late 1970s essentially to stop evasion and corruption and to cut the cost of salaries and other expenses of the taxation staff. The taxes which have been privatised are considered to be relatively simple to administer with little scope for discretion in assessment of tax liabilities, and exist in those areas where, due to the possibility of evasion and corruption, intensive supervision would be required [AERC 1990b].

DEVELOPMENT IN PAKISTAN

Almost all individuals, whether they are in a position to implement policies – such as government officials, academics, etc – or mere lay people, would agree on the need for programmes developed by government. What they may debate about is the extent and manner of that involvement. How much should be spent and where should it be concentrated, in what area and what nature of service provided? Some would argue that the general welfare of the state, the nation, the economy and society, would affect the general welfare of the inhabitants. The proponents of this view would emphasise higher growth, better management of the economy, adherence to structural adjustment programmes, and the like, and would subsequently hope that the fruits of growth filter down in the form of specific developmental factors where indicators would, or should, show an improvement. Such has been the thinking for most of the post-second world war period up to the end of the decade of the 1980s [Zaidi 1994b].

There can be little doubt that the economies of the world have grown at impressive rates since second world war. Progress, growth and development are clearly evident. The absolute levels of poverty have in general fallen. And soon. But there are also disturbing trends where not enough has been done, especially for the more vulnerable groups, whether they be men, women or children. Pakistan is a case in point.

Pakistan's economy has shown substantial growth of 6 per cent per annum for more than 40 years, with a GNP per capita of \$ 400 today. At the same time, the under-five mortality rate has fallen from 221 to 137 since 1960, the IMR has fallen from 137 to 95, and the adult literacy rate is around 30 per cent. Over time there have been noticeable

improvements, but despite these broad indications which show positive trends, the rates have been markedly slow concerning other important areas [UNDP 1994; World Bank 1992; UNICEF 1994].

The population growth rate is amongst the highest in the world at 3.1 per cent. Life expectancy is only 59 years, an average which is bettered by poorer countries. The literacy rate has grown only marginally in the last 15 years, with only 37 per cent children of school-going age enrolled in schools. The drop-out rate is close to 50 per cent. Furthermore, as much as a quarter of the population of children has low birth weight, and a very high percentage (40) of children below the age of four are classified as moderately or severely underweight. Statistics regarding social services only endorse this pattern of suffering and inadequate reach: only 45 per cent of the rural population, which accounts for 70 per cent of the country's population, has access to safe drinking water, only 10 per cent has access to adequate sanitation and sewerage. While the unavailability of water and sanitation only compounds the problem of poverty and disease, the fact that only 35 per cent of the rural population has access to health services exacerbates the situation manifold [UNDP 1994; World Bank 1992; UNICEF 1994].

Some more indicators regarding social development – or underdevelopment – would highlight further concerns. Female literacy, one of the most important indicators which reveals the status of a family, and especially that of children, is only 14 per cent. Worse still, in the province of Sindh the rural female literacy rate is 4 per cent, while in the province of Baluchistan it is only 1 per cent. With such poor levels of female literacy, a large number of supplementary indicators also suffer. Thus, despite some indicators of growth – the high and consistent growth rate of the economy, a growing GNP per capita – there is little real evidence that the people of this country have improved their social welfare. The fruits of development have not really filtered down.

The response to this failure has paved the way for the need for direct intervention. Now at least donor agencies are arguing for specific, highly focused, programmes which cater to the explicit needs of a target group, whether they are women, children, or rural populations. In this regard, the most accessible and lowest tier of government, local government, can play (and in some cases does play) critical roles. Let us now examine the contribution of local government to development [also see Zaidi 1991].

DEVELOPMENT AND MUNICIPAL GOVERNMENT IN PAKISTAN

The overall analysis of municipal governments regarding the provision of all services suggests a number of conclusions.

First, almost all urban councils have more or less restricted their role exclusively to the performance of some (or all) compulsory functions. This is true for larger urban centres, for in smaller towns and cities the financial and institutional capabilities of the councils restrict even the performance of compulsory functions. In these cases, it is the provincial government which intervenes and helps these governments to make ends meet – both financially and technically. In larger cities, the presence of water and sewerage authorities and development agencies plays a critical and ancillary role to the municipal governments. Without this assistance it is unlikely that local governments even in big cities could have managed. Some of the optional functions of these governments are also performed by these specialised agencies [AERC 1990b, 1993; Zaidi 1991, 1994a].

Education and health are still the primary responsibility of the provincial government, and these governments continue to play an extremely important role in the provision of services in cities. In larger cities, the provincial government plays a minimal role, as a large number of schools and medical facilities are either private, or then developed, administered, and financed by the local municipal government. However, as we show elsewhere, even large cities such as Peshawar (pop 1.5 million), lack the capability to run and develop their own schools, hospitals and dispensaries [Zaidi 1994a]. In smaller towns, the provincial governments play a formidable role, not only in education and health but in almost all other sectors as well. The reason for this is clearly that smaller urban centres lack technical and administrative capabilities and do not have adequate staff to undertake substantial development work. In many cases, large schemes (water supply, sanitation, drainage), which can only be undertaken by the provincial department in the case of smaller towns and cities, are after completion handed over to the local council. The local council is then responsible for operation and maintenance costs, which many are unable to meet [AERC 1991, 1993; Zaidi 1994a].

Essentially, then, local municipal governments, given the existing structure especially in smaller towns, do not have the capability to provide essential services which could positively affect development, such as water supply, drainage and sanitation, primary education, and hospitals and dispensaries. While many governments lack technical capabilities, financial constraints are more severe. A very large share of municipal government budgets goes towards recurring expenditure, a trend which is more pronounced in large cities. This expenditure goes towards maintaining and operating water supply schemes, public health, education and curative care. The highest per capita expenditure in the urban councils in the two

biggest provinces, Sindh and Punjab, is incurred on roads. In Baluchistan and the NWFP it is on drainage. In urban areas in the country the high priority sectors for development are water supply, sewerage and drainage, and roads, collectively accounting for 50 per cent of development expenditure [AERC 1990b, 1991]. The picture regarding development provided and undertaken by municipal governments is thus particularly dismal. Urban local governments, with the possible exception of the larger metropolitan corporations in Karachi and Lahore along with a handful of the bigger cities, do not provide either services or facilities which would have a positive developmental effect.

PROSPECTS FOR DEVELOPMENT BY LOCAL GOVERNMENT

Urban local governments have been specified a large and varied number of tasks and functions which they have to perform, and some which they may themselves choose to perform. The area and scope of the statutes regarding the provision of services and facilities is broad enough to encourage major projects in the social sector which could benefit underprivileged and vulnerable groups, especially women and children. Almost all major areas are covered in the statutes and a few more could be added. Technically, provincial governments can delegate further responsibilities to the local government as they deem fit.

The problem then is not one of statutory limitations but of financial and technical, and possibly conceptual and motivational, constraints to developing facilities affecting social welfare for the general public. There is a clear relationship with size of city as far as possibilities are concerned. The larger cities usually are in a position to raise funds and provide facilities and services to their populations. Smaller towns and cities just do not have the resources – of any kind – to provide other than very basic facilities, such as roads and drainage. To expect anything else would be very unrealistic. However, we have shown elsewhere that even the relatively large Peshawar municipal corporation spends as much as 86 per cent of its budget on salaries and electricity bills [Zaidi 1994a]. While Lahore metropolitan corporation does have a large number of health and medical facilities, it spends in all less than one-half of a percentage point on health care, spending one-tenth of a rupee per inhabitant [Zaidi 1994a]. Thus, while the larger corporations do have access to relatively more funds, their budgets too are quite small. The low fiscal outlay of the municipal councils necessarily make the salary and administrative costs look excessive. Thus, where revenue and expenditure are limited, as is the case in almost all councils, the costs of administration will remain high until the municipal revenue base is restructured and substantially enhanced.

While financial constraints are the biggest hindrance to the provision of services and facilities in cities, there are some others as well. In the larger cities, the establishment of development authorities and of specialised organisations like the water and sanitation agencies under the provincial government have played important roles in delivering services [AERC 1993]. In small cities the provision of local infrastructure is usually carried out by provincial line departments, in particular the public health and engineering department in the case of water supply and sanitation. This has meant that local bodies have been left in the role of having to provide for solid waste management, cleansing services, drains, etc. This implies that while services and facilities have been provided to the inhabitants, local governments as such have had their role further marginalised. Their role has been relegated to that of operating and maintaining services which have been developed and created by other agencies, a role which they have often been reluctant to play as they feel they were not involved in the planning and implementation process at an earlier stage. Furthermore, the link between service provision and local taxation has been weakened, and hence local government resource provision has been less than its potential. The provision of services and facilities by other agencies has meant that local governments have not been willing or eager to develop their own organisational and technical capability. It has been seen that many communities are willing to pay local taxes and user charges if they feel that adequate services will be delivered. However, local bodies will have little incentive to generate additional sources of income if they are not in a position or are under compulsion to provide municipal services, as the investments enabling the provision of services is under the control of other agencies. Thus, on the one hand while specialist agencies do provide facilities, their presence undermines the role local governments ought to play [AERC 1991, 1992b, 1993].

A general overview of municipal local government reveals that even basic services and facilities are not provided by local governments because they do not have the funds to do so. Furthermore, even if there is expenditure shown on sanitation, water, etc, there is no guarantee that the projects envisaged by local governments would deliver to the more needy and vulnerable population. In most cities, it is the well-to-do neighbourhoods which have access to better facilities. Thus, while local governments may show an increase in expenditure on such facilities, their location within the city would determine their real efficacy. Experience shows that poorer neighbourhoods, often on unregularised lands, where the most vulnerable and underprivileged population lives, do not have

access to the most basic facilities. The population which needs facilities most for its development is often neglected most by all tiers of government.

Furthermore, in recent years it has been observed that a larger amount of local government funds have been embezzled by elected members of the councils, a fact which has only helped discredit the role and potential of local government. In the Punjab recently 263 councillors and chairmen were named in a report and were accused of misappropriating close to Rs 500 million (*The Friday Times*, January 27-February 2, 1994). A summary of the recently constituted task force on the new social contract states that "since the 1980s, financial discipline in local bodies has been on the decline. They have learnt to live beyond their means and rules of financial propriety are not followed and local funds are largely misappropriated. Some of these violations include that [sic] expenditure on personal privileges has risen out of proportion. Sale of assets is uncontrolled and pre-determined criteria are absent. Annual audits are often avoided with impunity although the Local Bodies Ordinance require such audits and publication of audited accounts" (*The Nation*, January 19 and 21, 1994). Thus, local governments have come into disrepute and the people have lost their trust and faith in this tier of government. However, it would be fair to say that the higher levels of government are also not exempt from extensive misappropriation and embezzlement.

CONCLUSIONS

While there has recently been growing lip-service paid to the role local governments are expected to play in development, it seems quite clear that the existing structure of government in Pakistan does not permit any meaningful role to this important tier in the hierarchy. Local government has been reduced to an institution which pays recurring costs incurred by schemes often developed by other levels of government. Furthermore most, if not all, local governments face severe financial constraints and are not even in a position to pay the (growing and excessive) salaries of their employees. In the early 1980s, local governments seemed set to play a productive role in development, but ironically the return to democracy at the national and provincial levels has helped to subvert that possibility. Today local government in Pakistan is the least likely, given existing administrative and financial structures, to be able to play any positive role in development. Unless substantial steps are taken to redefine the context and nature of local development, local government will continue to be ineffective.

Having said that, it is also important to realise that within Pakistan, it would be fair to say that local governments alone are not

responsible for the dire straits they are in. Unless provincial and national governments practice better governance at all levels of the hierarchical structure, the status quo is unlikely to be changed. Local governments are ineffective not so much due to their own fault but due to the way they have been treated by the higher echelons of government. For local governments to work more effectively, higher tiers of government must have more confidence in the former and must relinquish effective control by the latter. Good governance for urban local government necessarily implies good governance at the provincial and national level as well. Lip-service alone will simply not do.

Investment, Exports and Growth

A Sceptical Note

Aditya Bhattacharjee

IN a recent paper in this journal, Athukorala (1996) has criticised the earlier contribution of Patnaik and Chandrasekhar (1996, hereafter PC). PC had contested the view that growth in developing countries can be explained by the "efficiency of resource use", by showing that the growth rates of GDP as well as exports could be substantially explained by the investment/GDP ratio alone in cross-country regressions. Athukorala argued that such single-variable regressions were inadequate to establish the superiority of the 'investment' view over the 'resource allocation' view. He proceeded to show that even in the original PC data set, both the investment ratio and the growth rate of exports were significant in explaining growth, although the coefficient on the former was much less than that estimated by PC. Also, he showed that export growth in turn could be explained by the investment ratio and a dummy variable which distinguished between inward and outward-oriented countries, thereby relating growth more directly to the policy regime. While there is merit in Athukorala's methodological criticism (and also that of Dubey 1996, with which I am not concerned), my purpose in this note is to show that his analysis is flawed, and that in fact his own results as well as several other empirical studies show the explanatory role of capital accumulation in growth to be more secure than that of trade-related variables.

Athukorala estimates two equations, using the PC data:

$$G = \beta_0 + \beta_1(I/Y) + \beta_2G_x + \mu \quad \dots(1)$$

$$G_x = \alpha_0 + \alpha_1(I/Y) + \alpha_2D_{OR} + \mu \quad \dots(2)$$

where G = GDP growth rate, I/Y = investment ratio, G_x = export growth rate, and D_{OR} is a dummy variable taking the value 1 for countries following outward-oriented policies, and zero otherwise. I begin by taking Athukorala's results at face value. All the variables are significant and of the expected positive sign; the R^2 are higher than in the comparable PC equations, and the addition of the trade variables is supported by F tests. He makes much of the fact that his estimated β_1 parameters are lower than PC's. However, if as he claims the OLS estimates do not suffer from endogeneity bias, we can substitute (2) into (1) to obtain the reduced form:

$$G = r_0 + r_1(I/Y) + r_2D_{OR} + \epsilon \quad \dots(3)$$

The coefficient of the investment ratio is actually $r_1 = \beta_1 + \beta_2\alpha_1$, which decomposes the effect of investment on growth into a

direct effect and one that works through exports. Correspondingly, the coefficient of the orientation dummy is $r_2 = \beta_2\alpha_2$. These composite coefficients, computed from Athukorala's parameter estimates, are reported below, along with the PC estimates (referred to here as β_{PC}) for the coefficient on the investment ratio in their GDP growth regression:

Period	β_{PC}	$r_1 = \beta_1 + \beta_2\alpha_1$	$r_2 = \beta_2\alpha_2$
1968-88	0.32	0.31	0.43
1968-78	0.29	0.28	0.76
1978-88	0.36	0.29	1.34

We see that when Athukorala's results are properly interpreted, the estimated coefficients of the investment ratio are very close to those estimated by PC, and in fact fall within an even narrower range! It is the coefficient on the orientation dummy which exhibits marked instability, placing a question mark on its reliability. However, let us continue to rely on Athukorala's estimates for a moment to examine his claim that they "provide strong support for the neoclassical (Bank-Fund) view", interpreted to mean that for the same investment rate, outward-oriented countries grow faster. This could as well be turned around by a 'structuralist' to argue that a suitably higher investment rate can substitute for the painful transition to outward orientation. The right-hand column above gives the modest increases in the GDP growth rate which could be expected from 'opening up'. Comparing these with the middle column, we see that depending on which period is used, a rise of between 1.4 and 4.6 percentage points in the investment ratio can yield the same increase in the growth rate. The debate then should revolve around the question of which is politically and economically easier to achieve.

However, this was only to show that Athukorala's own results do not support his conclusions. My more serious objection is to his methodology. If there were really no endogeneity problem, a direct OLS estimate of (3) using the same data should confirm his results. Instead, I obtained the following (t-ratios in parentheses):

Period	r_1 (OLS)	r_2 (OLS)	R^2
1968-88	0.30 (6.84)	0.70 (1.33)	0.74
1968-78	0.23 (3.42)	2.29 (2.92)	0.58
1978-88	0.29 (5.49)	1.12 (1.39)	0.67

Except for the earlier decade, the direct estimates for r_2 are not significantly different from zero. Once one investigates the nature

of the dummy variable, this is hardly surprising. Athukorala uses the four-fold classification of countries by degree of outward orientation in World Bank's 1987 *World Development Report*, collapsing them into two categories. He takes the classification from Edwards (1993) - but pays no heed to the scepticism Edwards himself expresses on the very same pages (1386-87) about the reliability of this controversial and inconsistent classification. In an earlier paper Edwards goes even further, observing that a "serious limitation of this indicator is that it is *subjective* in the sense that the researchers that constructed it used their judgment to classify different countries in the alternative openness categories" [Edwards 1992:51, emphasis in the original]. He and several other recent analysts use alternative measures of trade orientation for their far more sophisticated cross-country regressions, which I discuss below. To the extent that subjectivity makes the *WDR* indicator non-comparable across countries, Athukorala's dummy variable suffers from measurement errors. And to the extent that successful export performance influenced the Bank staff's perception of a country's "outward orientation" in assigning countries to categories, the dummy cannot be regarded as exogenous in equation (2).¹

In any case, the *WDR* classification, for what it is worth, is for 1963-73 and 1973-85, quite different from the sub-periods covered by the data used by PC and Athukorala. Moreover, Athukorala has arbitrarily classified countries which the Bank regarded as outward-oriented in either sub-period as being outward-oriented for the entire period, and added China to this list for good measure. He also seems to have used his own subjective judgment in assigning to the dummy a value of zero for Egypt and Paraguay, which were not included in the *WDR* classification at all. Although (as I shall show below) there is evidence of a strong relationship between investment and export growth in other studies, Athukorala's estimation of equation (2) is highly suspect.

GROWTH AND EXPORTS IN CROSS-COUNTRY REGRESSIONS

There remains equation (1). Cross-country regressions relating GDP growth to investment and/or trade variables have been estimated by several scholars in the last 30 years, so perhaps one should examine what these earlier studies have found before attempting to reinvent the wheel. The earliest studies, beginning with Emery (1967), simply regressed GDP growth on export growth rates and found significant positive coefficients. However, later investigators showed that these were not robust to changes in the data set [see Batchelor et al 1980,

which also gives a bibliography of the earlier studies]. Michaely (1977) pointed out that since exports are a component of GDP, the correlation was only to be expected and had no explanatory power. He suggested certain adjustments which need not detain us here. What is important is that Athukorala's equation (1) does not acknowledge this as a problem. (Sheehy 1993 and other references cited there show that such specifications result in inconsistencies and biased parameter estimates.)

Other investigators realised that bivariate regressions were unsatisfactory, and tacked on various other explanatory variables. Of particular significance were 'growth accounting' specifications derived from production functions, incorporating the growth rates of capital stock and the labour force [e.g. Feder 1983]. This has now become the standard practice. More recent investigators have incorporated school enrolment ratios (to measure human capital); GDP levels in some earlier year (to test for 'conditional convergence' between countries at different initial levels of development); shares of government consumption in GDP (to measure the costs of 'resource misallocation'), and literally dozens of other variables, including several alternative measures of outward orientation. In fact, with the spread of powerful econometric packages, computing facilities and electronically accessible databases in recent years, along with the renewed interest in growth economics, running cross-country growth regressions has become virtually an industry.

Perturbed by this deluge of often contradictory results, with various authors between them finding over 50 variables to be significant determinants of growth, Levine and Renelt (1992) have carried out a truly subversive exercise, which is of special relevance to the point at issue here. They assembled a data base of over 50 variables, most of them time series, and ran thousands of growth regressions to test whether the conclusions of the earlier studies were robust to small changes in the set of conditioning variables. For each candidate explanatory variable, they estimated coefficients in multiple regressions with different combinations of conditioning variables, and computed the upper and lower 95 per cent confidence limits from the highest and lowest estimate for the coefficient of interest. The variable was deemed to be robust only if these upper and lower bounds were both significantly different from zero and of the same sign. Most of the explanatory variables in the literature failed this test, but the investment ratio passed handsomely. Their findings on variables representing trade and price distortions are worth quoting at length:

First, if one substitutes imports or total trade for exports in cross-country growth or investment regressions one obtains essentially the same coefficient estimate and coefficient standard error. Thus, researchers

who identify a significant correlation using an export performance measure should not associate this with exports *per se*, because it could be obtained using a corresponding measure of imports or total trade. Second, the share of trade in GDP is robustly positively correlated with the share of investment in GDP. Finally, when controlling for the share of investment in GDP, we could not find a robust independent relationship between any trade or international price-distortion indicator and growth. These three results indicate that the relationship between trade and growth may be based on enhanced resource accumulation and not necessarily on the improved allocation of resources... These results suggest an important two-link chain between trade and growth through investment [Levine and Renelt 1992:953-55].

Levine and Renelt seem to favour a causal chain running from trade through investment to growth. However, their results equally support the PC hypothesis which runs from investment to exports and growth, and has the merit of being grounded in a theoretical framework. I should point out that these results involved the export share in GDP as the relevant explanatory variable, while Athukorala and some earlier investigators used the export growth rate or export growth times the share of exports in GDP. However, Levine and Renelt also report that they tried these, and found that "neither of these variables is robustly correlated with growth when the regression includes corresponding fiscal indicators [e.g. growth of government consumption expenditure]. Given the national accounts identity, even if we found a robust relationship, it is not clear what worthwhile inferences could be drawn" (p 957, n 14). As they put it more sarcastically in an earlier footnote, "one only needs to include the growth rates of enough components of GDP to explain the cross-country variance in growth" (p 952 n 8). Note that this is the same point made by Michaely (1977). (Since the numerator of the investment ratio is the investment level rather than its growth rate, it is exempt from this criticism.) In short, Athukorala's equation (1) is mis-specified.

GROWTH AND TRADE POLICY

Levine and Renelt also found that six measures of trade policy orientation and distortion could not be robustly related to GDP growth. On the other hand, Edwards (1992) and Harrison (1996) also use alternative trade policy indicators in growth regressions and find them generally significant, and make a case for openness. However, they both finesse some problems with their results. For nine of the ten openness indicators he tries out, Edwards does not report the numerical value of the 't'-statistic: he only mentions that it lies between one and two for eight of them, and one of these has the wrong sign. Considering that the number of observations in Edwards'

regressions ranges from 30 to as low as 12, this is far below the conventionally accepted level of statistical significance. The ninth indicator, for which he reports $t > 2$, is the WDR classification, about which as noted above Edwards himself is openly sceptical. Only for one index (actually the set of so-called Leamer indices) does he report significant t values, but he himself is aware of the limitations of these indices, including the fact that they are available for only 1982 and yet must be assumed to represent openness for the entire period (1970-82) of his study. Furthermore, Levine and Renelt find the Leamer indices to be both non-robust and contradictory: the separate indices for openness and intervention are *positively* and significantly correlated with each other!

Harrison finds that the relationship between openness and growth cannot be established in cross-section regressions which use averages of the data over long periods, which is the method used by Athukorala (and Edwards). This is presumably because "most developing countries have experienced large swings in commercial and exchange rate policies over the last 30 years, which could render any proxies for openness essentially meaningless" [Harrison 1996:432]. This would apply especially to the Leamer indices, which gave Edwards his only worthwhile result, and which Harrison explicitly rejects. Her panel estimation using annual data (i.e. pooling the cross-section and time series data) gives the strongest verdict in favour of openness. However, a limited sensitivity analysis she undertakes along the lines of Levine and Renelt shows that half the openness indicators found to be significant are not robust. Nonetheless, she finds it encouraging that the remaining half are robust. What is noteworthy in this context is that in both studies the investment ratio is significant in *every* regression, regardless of which other variables are used.

Two other issues that have been examined in this extensive literature are also relevant, and may explain the mixed results obtained for the trade policy variables. First, several investigators from Michaely (1977) onwards have found heterogeneity and threshold effects in the impact of exports on growth, with the relationship being much weaker or non-existent for the poorer developing countries. Second, the observed partial correlation in some studies between exports and growth cannot be held to signify causation; several studies have used Granger tests and have shown the possibility of the causation running both ways. Edwards (1993) summarises some of the relevant results (also mixed) on both these issues. Harrison (1996) also finds that the causality between *openness* and growth can run in both directions, her explanation being that protectionism has historically been a response to depressed growth.

To sum up, while the role of investment in promoting growth seems empirically well established, that of openness to trade is still

subject to several ifs and buts. (Note that 'efficiency of resource allocation' has not really come into the picture, for it certainly cannot be identified with either a liberal trade regime or rapid export growth.) Much of the recent theoretical literature on endogenous growth is similarly ambivalent on the impact of trade policy. Strong supporting evidence of another kind comes from the revisionist study by Young (1995) who showed that east Asian growth can be substantially explained by the growth of capital and labour inputs, with residual productivity growth (and hence efficiency gains of various kinds) playing a distinctly secondary role.

Of course, Athukorala and Dubey have argued that the World Bank view they espouse does recognise the importance of promoting *both* investment as well as efficiency. (Incidentally, Edwards, Harrison and Levine all conducted their research while working at the World Bank.) But it is between the World Bank's supposed intention and execution that the shadow falls. Other cross-country exercises, conducted independently by a World Bank team which strongly supported liberalisation [Thomas and Nash 1991] as well a group of critics [Mosley 1992], compare the performance of recipients of the Bank's structural adjustment loans during the 1980s with that of other countries, controlling for other variables. While the loan recipients on average exhibited better balance of payments trends, their investment ratios deteriorated, with even the Bank team expressing concern over this [Thomas and Nash 1991:59]. The reasons are familiar: the slashing of public investment in order to meet the Bank/IMF fiscal conditions on the one hand, and on the other the sluggishness or decline of private investment due to the deflationary effect of fiscal compression, and also the fear that the reforms would be reversed in view of the economic and social instability they often cause.

It is true that in India's case the early fears of analysts like PC regarding a similar decline in the investment ratio have not been borne out. But it has certainly not *risen*, and this is what their theoretical model, the vast empirical literature surveyed above, and the experience of the east Asian countries all show to be required for a sustained increase in the growth rates of both exports and GDP. On this, there seems to be 'conditional convergence' in the views of all the participants in this *EPW* debate as well as the World Bank and the government's *Economic Survey 1995-96*. The reasons for the poor response of India's domestic savings and investment to liberalisation have been consistently advanced in periodic editorials in this journal, and need not be repeated here.

The results reviewed above should not, however, be interpreted as justifying a return to the simplistic 'investment fundamentalism' of most 1950s development literature. First, greater attention needs to be paid to

the productivity of investment, although there is very little evidence that openness promotes greater productivity growth [Pack 1988; Rodrik 1992]. Second, almost all the studies find school enrolment ratios to be a significant and robust influence on growth. This suggests that the concept of investment needs to be broadened to include human capital - and on this front India's record is even more dismal. Third, some recent work also suggests that the direction of causation runs from growth to physical investment (possibly via human capital formation) rather than the other way round: see Barro and Sala-i-Martin (1995, ch 12) and Blomstrom et al (1996). This would make (I/Y) endogenous in equations (1) and (2) above, and partly account for the instability of Athukorala's estimates. (He seems to have tested only for the exogeneity of G_t .) However, it would equally call into question *all* the analyses reviewed here.

The debate over the empirical determinants of growth is clearly far from over, but the reverse causality inferred by the more recent studies, together with the robust relationship between investment and exports established by Levine and Renelt,² is consistent with the early formulation by Patnaik (1972) in terms of exports inducing investment, rather than the other way around as in PC (1996). The earlier paper dealt with private investment in advanced capitalist countries, while the latter is concerned with developing countries where public investment plays a leading role in building supply capacities as well as a secure base of domestic demand. In mixed economies both processes work simultaneously. What seems to be required, therefore, is disaggregation of the (I/Y) variable into public and private components. Barro and Sala-i-Martin (1995:pp 441-42) find that the composition of investment has no effect on the GDP growth rate in cross-section analysis, but it is possible that there is a complicated causal mechanism linking exports and GDP growth differentially with public and private investment through leads, lags and feedbacks that can be detected only in time series. This is a subject for future research.

Notes

[I would like to thank K L Krishna, Shantanu Lodh and J V Meenakshi for improving my understanding of some of the issues addressed in this paper. Any deficiencies that remain are entirely my own.]

1 UNCTAD provided a very different taxonomy of countries in its 1992 *Trade and Development Report*. The differences between the WDR and TDR classifications were highlighted in these columns by Dhar (1993).

2 This is reinforced by the more informal cross-country study of Argosin (1993), who found a significant relationship between the growth rate of manufactured exports and the investment rate, but *no* such relationship between export growth and two measures of import restrictions.

**Save with
State Bank
of India —
face life
with a
smile**

You and your family can make a picture of happiness and security, year after year. With your savings in State Bank of India, you can keep smiling through life and times.

You can choose from a wide-range of schemes that offer liquidity, high-returns and safety for your hard-earned money :

- **Savings Bank Account.**
- **Recurring Deposit Scheme.**
- **Fixed Deposit Scheme/Re-Investment Scheme.**

With a network of 8798 branches across the country, State Bank of India is at your service, even in the remotest area.

Save with State Bank of India.

Be assured of life-long security.

For details, contact the nearest SBI branch, today.

State Bank of India

Security is a warm feeling.

A GOOD BUSINESS COLLABORATION IS LIKE A HANDSHAKE.
THERE IS NO UPPER HAND.

Today's business environment is one of global interaction and cross-border affiliations. Companies with a common purpose and direction, quick to join forces. And yet, what defines a perfect business collaboration?

At Colour-Chem, we believe it is a relationship of equals: Just as the one we share with our global associates—Hoechst AG, Germany.

As a result of this relationship, Colour-Chem has access to world-class technologies, a reach into international markets and radically different management styles.

Styles that emphasise on quality of the highest order. That lay stress on being concerned on the customer's behalf, for his time and money. And that inculcate professionalism within the organisation.

Today, Colour-Chem is a Company that is on the move. With an established presence in domestic and foreign markets, and new horizons to conquer

We are confident that we will make it happen with our partner in progress—Hoechst AG. Because ours is a relationship of equals

Vol XXXI Nos 45 and 46

November 1996

Child Labour and Compulsory Primary Education

Indian policy-makers continue to be mired in a set of views that preclude their taking the necessary steps to get children into school and out of the labour force. They also pursue a set of industrial policies that promote the employment of children in the small-scale sector. These views are so widely shared that no political party of the right or left, no trade union, no religious organisation and not even the educational establishment has been pressing for policy changes to make elementary education universal and compulsory, which alone can put an end to child labour. **3007**

Industry, Finance and Employment

The rich industrial countries of the OECD are going through a profound technological revolution spearheaded by the computer. Stock markets are booming, corporate profits are at an all-time high, but wages are falling, job insecurity is pervasive and social tensions are mounting. In the contradictions between 'industry' and 'finance', the former presses for output growth and the latter insists on zero-inflation. In this battle royal, labour is the worst loser. **3001**

From Housewifisation to Androgyny

Androgyny stands for overcoming the cultural parameters defining what it means to be a man or a woman and raising the problem of a common humanity. Work then is defined in terms of ability and interest and the distinctions between men's work and women's work are devalued. Through the specific case of a Christian nun who led the fisher people's struggle in Kerala in 1984, an attempt to understand how androgyny is a useful exercise for understanding women and creative work. **3015**

'Joint' Forest Management

The notion of 'joint' management of forests needs to be looked at historically in order to uncover the degree of state intervention in what are generally known as community forest protection schemes. The history of forest protection efforts by one village in Sambhalpur district of Orissa brings out some of the internal and external threats to the sustainability of joint or community forest management. **3021**

AIDS Extravaganza

By focusing on the recent advances in the treatment of AIDS patients, the international AIDS conference in Vancouver and the media covering it failed to highlight the more immediate need to expand AIDS prevention programmes in the developing countries. **2987**

Redefining Development

The consequences of the only development model before us, the one presented by the developed capitalist countries, are becoming increasingly evident globally. An examination of the implications of an alternative development paradigm for important areas such as agriculture, industry, energy, capital and the respective roles of the state and the market. **2991**

Old Equations

The Uttar Pradesh assembly elections will be remembered for the decisive turning away of both the SP and the BSP from their anti-upper caste, dalit-backward-Muslim agenda to old, Congress-type status quoist social equations. **2983**

Away with Pests

The current drive by the Left Front government in West Bengal to phase out hand rickshaws is a part of the grand plan to modernise Calcutta in the context of globalisation. Unlike the last time, in the early 1980s, when the Left Front had attempted to abolish hand rickshaws, there has been little protest from any quarter today. **2977**

Missing the Target

Money market developments after the latest credit policy announcement have thrown into sharp relief the narrow groove in which the banking system has got stuck and the rigidity in the operations of banks and financial institutions encouraged by the limited perspective of the so-called financial sector reforms. **2970**

Post-Crisis Peru

The reform government of Alberto Fujimori has succeeded in restoring domestic security and economic growth in Peru. But this has been at the cost of an inert civil society and over-concentration of power in the person of the president. **2986**

Women and Land

THIS is in response to the 'vituperative' debate between Bina Agrawal and Indu Agnihotri. Unfortunately the latter's attempt to "set the record straight" in the September 28 issue only betrays both her ignorance of the land situation in India and her downplaying of the significance for women of the caste-linked patrilinear, patrilocal social structure.

Where would women get their land, she asks? Obviously they would get a share of family land, not of the 1.04 million hectares available for distribution to the landless (families), not of the land that could be presumably seized from big farmers. Some projects for land for women ask for shares of waste land or surplus land to be farmed co-operatively by groups of women or for distributed land to go in the name of women rather than male family heads; these represent a major step forward. But until women get a share of family property, the hold of the patrilinear social structure which keeps them propertyless, resourceless and dependent will not be broken. The major form of property relevant in the rural areas is land (though we also want to talk of houses, animals and other fixed assets, as well as entitlements to education and knowledge-as-property) and so a broad campaign for land rights to women is at the core of a liberation movement. Bina Agrawal has posed the question, if we say 'land to the tiller' is crucial for the landless in general, what about the landlessness of women?

Indu Agnihotri seems to be under the impression that landholding is so concentrated that the issue of family land and patrilinear inheritance is of relevance only to a minority. Land distribution in India is indeed unequal but it is also widely dispersed. The figures are something like 25 per cent of rural households not cultivating land, only 9 per cent not owning land. A high percentage of these are small holdings, but these are also relevant to women. Even a small bit of land can provide security and a resource base, not to mention status.

It is also erroneous to imply that all dalits are landless (Agnihotri does not even try to talk about trihals in this connection). This varies very much from region to region, but in many states many sections of dalits have small holdings. This is true for instance in Maharashtra, Karnataka, apparently in Bihar, to some degree in Orissa from what I have seen. And as dalits win control of government lands or of 'surplus' or a share of the commons, the issue of who in the

dalit family will control the land becomes crucial - as the women in the Bodha Gaya struggle understood very well.

Giving an explicit share in 'family' property to women is relevant even to the landless. Where the hut, small animals, all are under the control of the man, he can expel his wife. We know cases of 'abandoned' women, back in their maternal home and living with an old father and mother, working as labourers to support them - but knowing that when their father dies the house they live in will go to some distant brother, since women simply do not have inheritance rights.

In the villages I have seen where the Shetkari Sanghatana and Shetkari Mahila Aghadi campaign for land rights for women has been carried on, the overwhelming majority of land given to women have been small shares of 1/4 to 1/2 acre. The women involved have been from all castes, including dalits. And major obstacles have come from the state government, which has in most cases refused to recognise these sales because, according to them, 'breaking up' landholdings below five acres leads to land fragmentation. Where the campaign has demanded a straightforward share for women, the government has proposed joint pattas. I understand the West Bengal government also supports this. I would only say, ask the women themselves which they prefer! And the support of the wider women's movement for land for poor women is necessary to break this official prejudice against women having land.

Indian women's landlessness cannot be blamed on colonialism. While colonial rule has almost everywhere worsened the situation

of women in regard to land rights, this does not negate the differences of traditional social structures between societies in south Asia and China compared to those of south-east Asia and elsewhere. Amartya Sen's 100 million 'missing women' are found almost entirely in India and China because of their traditional patrilinear, patrilocal kinship structures. When we refuse to believe that patriarchal social structures are as strong, as long-lasting, as hard to combat as class social structures, we are simply leaving ourselves helpless before the millennia-old subordination of women.

Patriarchal bias, as Agnihotri rightly points out, is not a leftist prerogative. If feminists sometimes seem to over-criticise the left on this issue, it is because they expected more. After all, those who talk of 'land to the tiller' and proletarianisation should recognise propertylessness where it exists, even inside families. Or are we going to say that women automatically have the class positions of their husbands? Our debate here is an old one and has to do with whether patriarchy and gender (and caste) and other oppressive social structures can be seen simply as a reflection of particular class relations, or whether they have an existence of their own that has to be analysed and combated.

Bina Agrawal deserves congratulations for a well-documented and eloquently argued study on this issue. If at points the debate becomes a bit emotional it is because we have been coming up against a stone wall here for a long time.

Narrow Perspective

THE long delay in finalising a code on corporate take-overs based on the Bhagwati Committee's report underscores the complexity of the issue. As was pointed out by the Statement of Industrial Policy (1991), the amendment of the Monopolies and Restrictive Trade Practices (MRTP) Act and the Foreign Exchange Regulation Act (FERA) diluted or did away with pre-investment scrutiny of investment decisions of MRTP and FERA companies, including in many cases the requirement of "prior approval of the central government for expansion, establishment of new undertakings, mergers, amalgamations and take-overs". This has encouraged a virtual boom in mergers and acquisitions, with take-overs often involving large transnational companies that were already operating in the domestic market (Unilever, for example) or are more recent entrants (Coca Cola). What the Bhagwati panel seeks to do is to amend the hitherto ad hoc regulation of such take-overs with four objectives in mind: (a) to legitimise take-overs so long as a procedure laid down by the Securities and Exchange Board of India (SEBI) is followed; (b) to clearly define that procedure; (c) to facilitate the participation of minority and small shareholders of the target company in the take-over process; and (d) to strengthen the regulatory capacity of the SEBI in this regard.

A code with these objectives must begin by defining, however arbitrarily, when the acquisition of shares of a company by an individual or another company constitutes a take-over. Difficulties arise when the acquisition of control is based on share purchases in a third company with a controlling interest or there are a number of companies acting in concert. Hence, in a major departure from past policy which accepted take-over as a possibility when more than 10 per cent of a company's share capital was acquired, the Bhagwati Committee has recommended that "not only acquisition of shares but also voting rights in a company or control over the company, howsoever such control be exercised—directly or indirectly—must be covered under the regulations and the present definition of acquirer". This implies that the new regulations, if and when implemented, would be triggered even when control of listed companies is acquired through buying into, say, investment companies that control a majority of equity in them. The only situation when the regulations would not apply would be in cases of 'creeping take-overs' through purchases of up to an additional 2 per cent of equity in a year by those holding between 10 and 25 per cent in a company or up to 5 per cent in a year when the holding is between 25 and 50 per cent. Finally, the committee has recommended that "the definition of persons acting in concert be expanded to include mutual funds, their sponsors, asset management companies and trustees, foreign institutional investors and banks, financial advisers and stock brokers".

Thus not only has the definition of take-overs been widened but so has the coverage of the type of actors who can be involved, subject of course to any other laws applicable with respect to the investor concerned. The first point to be noted is that by providing this definition and recommending regulations that must apply, the government has virtually legitimised take-overs, whether negotiated or hostile, provided they are effected in the manner prescribed. The regulations, in the committee's view, "should operate principally to ensure fair and equal treatment of all shareholders" without imposing "conditions which are too onerous to fulfil and hence make substantial acquisitions and take-overs difficult".

To that end the committee recommends that when the take-over provisions are triggered the acquirer must make a public announcement of his acquisition of share and make an offer to buy at least 20 per cent of the equity from shareholders at a pre-specified price. That price itself is to be calculated taking into account the price paid by the acquirer for shares purchased to ensure a change in control and/or the average six-month high and low prices in the stock exchange. To prevent frivolous offers, a sum equal to 10 per cent of the offer value has to be deposited in an escrow account with provision for forfeiture in case of default on the promise to buy.

All this does indeed help small investors to benefit from the inflated values at which share transfer takes place in the course of a negotiated or hostile take-over of a company, with the opportunity to opt out in case they do not have confidence in the new management. It also allows incumbent managements to respond to a take-over threat, by requiring early declaration of a challenge to management (10 per cent of equity or indirect acquisition of control) and by rendering the process transparent. Since financial institutions, which control substantial chunks of equity in many listed companies, are known to favour incumbent managements, this would on the whole make acquisition difficult and dilute the role that stock markets are purported to play as monitors of managerial discipline. Only when the acquirer has deep pockets to buy out at any price as it were would the acquisition route to expansion be pursued.

Thus what the committee's recommendations really achieve, in combination with the liberalisation of MRTP and FERA regulations, is on the one hand to legitimise business expansion through acquisition as a normal business practice, while favouring incumbent managements and shareholders in the course of a take-over bid. On the other hand, by shifting the responsibility for regulating take-overs to SEBI and focusing on the capital market aspects of the process, especially the need for investor protection, the committee and the government have underplayed the need for regulating mergers with the objectives of (a) curbing concentration of corporate power,

and (b) guarding domestic companies against threat from major international players. The latter is a crucial consideration because transnational firms with deep pockets have the wherewithal to offer attractive rupee prices to acquire additional stock, including the 20 per cent they need to buy for embarking on a take-over. Not surprisingly, there is enough evidence already of increase in take-overs with the aim of market entry or market consolidation by leading corporate players.

The Bhagwati Committee's recommendations thus have two contradictory tendencies. By favouring incumbent managements, they bias the take-over procedure in the direction of sustaining managerial status quo. At the same time, by legitimising negotiated or hostile acquisition of shares by large domestic and international companies with substantial financial strength, they accentuate tendencies towards product and capital concentration. Both these tendencies, it should be obvious, are likely to hinder rather than advance competition, which the dilution of MRTTP and of foreign investment regulation under the economic reform regime is supposed to achieve.

INTER-STATE COUNCIL

Empty Ritual?

TRUE, this was the only second time in almost 50 years since independence that the Inter-State Council was called to meet. True also that it had taken 44 years for the government at the centre to set up the council and that too only when a non-Congress administration was in power. But what exactly is the Inter-State Council supposed to do if and when it does meet? Do we get any insight on this subject from the reported outcome of the council's meeting on October 15?

The agenda of the council's meeting comprised consideration of the Sarkaria Commission's recommendations. It is worth recalling that this commission's report has been hanging fire for over 10 years, unless the formation of the Inter-State Council is itself considered as a follow-up to the commission's recommendations. A subcommittee of the council had been deliberating on the commission's various recommendations for almost five years and the October meeting of the council was to decide what action to take on the recommendations of the subcommittee. Of the 247 recommendations of the Sarkaria Commission, the subcommittee had finalised its views on 179, proposing 130 recommendations for acceptance without modification, 25 for acceptance with modifications and 24 for rejection. Significantly, however, on major issues of centre-state relations such as declaration of a state of emergency, discretionary powers of governors, reservation of bills, union's directions to states or centre-state financial relations the subcommittee has been unable to reach a consensus. Indeed, the agenda of the Inter-State Council meeting sought to exclude financial relations from its

deliberations on the ground that the subcommittee had yet to finalise its views, giving one the impression that the subcommittee is to continue its functioning.

The present United Front administration had, on assuming office, committed itself to work towards strengthening political federalism and devolving powers and authority in the political, administrative and economic spheres by pledging itself to a 'two track' policy on the Sarkaria Commission's recommendations, the first track consisting of action on recommendations on which there was a consensus and the second track involving the setting up of an expert committee which would "review and update" the Sarkaria Commission's proposals and also look into "the vital question of devolution of financial powers" within three months.

The question to ask at the end of the council's meeting is whether or not the commitment to proceed on two tracks is within sight of fulfilment. All that the home minister's statement tells us is that a standing committee of the council will, on its appointment, review the Sarkaria Commission's recommendations. It is totally silent on the appointment of the expert committee. All that it says is that experts may be invited by the standing committee for consultation. But how long will the standing committee take to complete its tasks, be these in regard to areas on which there is a consensus or in regard to others where review and fresh consideration are called for, including centre-state financial relations. Going by the way the earlier subcommittee took five years to report, will the standing committee function with any greater speed? Or will the whole matter remain in suspended animation for yet another five years?

RBI AND DEVELOPMENT FINANCE

Time to Return to Old Role

A REMARKABLE, but relatively little noticed, aspect of the Reserve Bank of India's *Annual Report* for the past two years has been the transparency in the presentation of the highlights of the central bank's operations as reflected in its annual accounts. Being the apex monetary authority, the assets and liabilities of the RBI constitute the fountainhead of money creation in the system in the form of 'primary' or 'reserve' money. The RBI's latest balance sheet total as of October 18, 1996, for instance, was Rs 2,25,287 crore, while 'reserve money' stood at Rs 1,89,129 crore, the difference of Rs 36,158 crore representing the non-monetary liabilities of the RBI. These non-monetary liabilities constitute capital and accumulated reserves and funds out of the profits of the central bank; when they are netted against the relatively small amounts of non-monetary assets such as the RBI's investments in buildings, furniture and fixtures, etc, the balance constitutes the RBI's net non-monetary liabilities which have the effect of contracting liquidity in the system.

The net non-monetary liabilities of the RBI have expanded significantly in the past two years. They were around Rs 26,000-27,000 crore for five years from 1990-91 to 1994-95. Then they rose to Rs 30,000 crore in 1995-96 and have gone up further to about Rs 36,000 crore in 1996-97 so far. Thus there has been an addition of about Rs 10,000 crore to net non-monetary liabilities in the past two years, almost all of which is attributable to financial sector reforms and some fall-out of the stabilisation programme such as the depreciation of the rupee and rise in yield rates on treasury bills and government securities.

The RBI's total income, after various provisions, has shot up by 67 per cent in the last two years from Rs 7,145 crore in 1993-94 (July-June, the RBI's accounting year) to Rs 11,932 crore in 1995-96. The sharpest increase has been in earnings from foreign investments, from Rs 722 crore to Rs 3,723 crore. Earnings from domestic investments have risen by 28 per cent from Rs 6,424 crore to Rs 8,209 crore. At the same time, the reduction in cash reserves maintained by banks and non-payment of interest on incremental CRR beyond the March 1990 level have helped to contain the rise in the RBI's expenditure to 14.5 per cent from Rs 3,778 crore in 1993-94 to Rs 4,324 crore in 1995-96.

The resultant increase in the surplus or net disposable income of the RBI from Rs 1,504 crore in 1993-94 to Rs 3,942 crore in 1995-96, however, hides the true picture of the rise in the RBI's profits and provisions, for the income and appropriations exclude a series of provisions for various contingencies. The RBI rightly adopts conservative accounting norms. Its securities portfolio is fully marked to market and at the end of every month the portfolio is valued at the lower of book value or market value. Depreciation is provided if the market value is lower, but any appreciation is ignored. Among the major reserve funds, the Contingency Reserve (CR) is intended to enable the central bank to meet any unforeseen liability arising out of a sharp fall in the value of securities and gold and valuation loss due to exchange rate fluctuation. But the CR is used to meet exchange losses only when two separate reserves specifically created for the purpose prove insufficient. There is the Exchange Fluctuation Reserve (EFR) which represents the accumulated net gain on valuation of foreign currency assets and gold. Gains or losses on the valuation of foreign exchange assets are not booked into the profit and loss accounts, but are credited/debited to the EFR. Out of the EFR an appropriate amount is transferred to an Exchange Equalisation Account (EEA) to meet the exchange losses in respect of liabilities under schemes involving exchange guarantees by the RBI, such as the India Development Bonds (IDBs) and funds parked by financial institutions with the RBI. Such exchange guarantees are no longer being given by the RBI; hence there will be no additional pressure on the EFR due to such schemes (except for the outstanding IDBs and FIs' funds).

It is the very large increase in the balances in these three reserve accounts that deserves attention. The CR has gone up from Rs 2,674 crore at the end of June 1994 to Rs 7,726 crore at the end of June 1996 – an addition of Rs 5,052 crore in two years. More significantly, the EFR and EEA together have swelled by Rs 6,338 crore, from Rs 8,457 crore to Rs 14,795 crore during this period. A number of policy changes have been effected in the deployment of RBI surpluses in recent years. As part of the task of promoting term-financing institutions (IDBI, SIDBI, SFCs and NABARD), large amounts used to be transferred year after year from the profits of the RBI into four statutory funds specially created for this purpose. This practice was discontinued in 1992-93 following an arrangement with the World Bank and the Asian Development Bank for a structural adjustment loan for financial sector reform. The argument was that as part of financial sector reform public financial institutions must be placed on an equal footing with private ones: they must no longer have access to concessional sources of finance and must rely on the market for mobilising funds at market-related rates of interest.

The RBI also used to carry heavy liabilities on account of the exchange guarantee given on external deposits under the foreign currency non-resident accounts (FCNRA) scheme. The government took over the exchange risk liabilities relating to the FCNRA deposits from July 1, 1993. Against this the RBI agreed to provide additional support to the government out of its income. Thus in addition to the normal transfer of Rs 1,500 crore per year to the government, the RBI transferred Rs 2,058 crore in 1994-95 and Rs 2,438 crore in 1995-96. These transfers have been just enough to provide exchange protection for maturing FCNRA deposits. The RBI has revealed that 1996-97 will be the last year when there will be sizeable FCNRA losses to be borne and the losses will be totally extinguished by August 1997. The system of extending exchange guarantees on foreign currency deposits has been done away with and the new schemes carry no exchange guarantee by either the RBI or the government. To the extent the RBI has obligations on the IDBs and the FIs' funds parked with it, the Rs 2,819 crore in the EEA at the end of June 1996 is believed to be sufficient to meet them.

RBI spokespersons have claimed that the central bank's balance sheet has been cleaned up because of the stoppage of payment of interest to banks on incremental CRR and the discontinuance of exchange protection for external deposits, but two other very favourable developments have been the steep depreciation of the rupee since July 1991 and the sharp rise in yield rates on treasury bills and dated government securities even as the government's monetised deficit has continued to be high. The RBI's average earnings on its foreign exchange assets have also gone up from 4.87 per cent in 1994-95 to 6.18 per cent in 1995-96. Since any sizeable

appreciation of the rupee can be safely ruled out as can be a sharp depreciation of the RBI's investment portfolio (with the dire need to lower yield rates on government securities, the price of government paper is likely to rise), there is little chance of any significant depletion of the RBI's existing reserves.

Against this background and the accumulation of Rs 14,795 crore under the EFR/EEA and Rs 7,726 crore under the CR, the RBI must seriously consider extending additional support to financial institutions assisting industrial and agricultural development. In the name of financial sector reform, the RBI abdicated a vital promotional function with additional adverse repercussions on the liquidity situation and real rates of interest in the economy. To mobilise resources from the market the financial institutions have had to engage in pointless competition which has pushed up the average cost of funds for all – banks, FIs themselves and manufacturing firms. The release of CRR funds has not helped much. Instead if the RBI were to provide an additional Rs 3,000 to Rs 4,000 crore as support to the financial institutions at, say, the bank rate of 12 per cent, it would make a significant impact on these institutions' cost of funds which would make it possible for them to effect more worthwhile cuts in their lending rates than they have done recently.

Implicit in this is a strong case for the RBI's assistance to be directed to individual institutions, purposes and sectors, including sector-specific refinance facilities for banks. After all, the huge reserves (other than those from revaluation of foreign currency assets and gold) which figure in the RBI's balance sheet have come from the domestic economy and so denote corresponding contraction of liquidity. In 1994-95, for instance, the RBI's net non-monetary liabilities rose by Rs 3,321 crore, while RBI credit to the commercial sector (FIs other than NABARD) expanded by just Rs 148 crore and for 1995-96 the figures were Rs 2,943 crore and Rs 262 crore, respectively. Clearly, it is time the RBI reconsidered the misguided decision taken five years back and returned to its role of promoting long-term investment in industry and agriculture through augmenting the loanable resources of the relevant term-financing institutions.

PUNJAB

Cheery Tidings for SAD

BY sweeping the Shiromani Gurudwara Prabhandak Committee (SGPC) polls, the Shiromani Akali Dal (SAD) has strengthened its prospects for the Punjab assembly elections to be held in next February. This victory follows the success of the SAD-BSP alliance in the parliamentary elections in May this year.

The results of the SGPC polls, held after a long gap of 17 years, indicate that the SAD was able to mobilise a wide cross-section of Sikh votes in its favour. The SAD won 155 of the 170 seats spread across Punjab,

Haryana, Himachal Pradesh and the union territory of Chandigarh. The tacit support of the BJP, which exerts influence over the 15 per cent or so votes of Sahajdhari Sikhs in the region, contributed to the performance of SAD. Most importantly, the results reaffirmed the marginalisation of extremist Akali factions within the Sikh community. Akali Dal (Mann), Damdami Taksal and Sant Samaj had extended support to the Akali Dal (Panthic) candidate, Darshan Singh Ragi, the former head priest of the Akal Takht. The failure of the extremist factions to put up a credible challenge in the SGPC polls after their rout in the parliamentary elections confirms that Sikhs in Punjab are in favour of moderate Akali politics.

Though the Congress has never participated in the SGPC polls, it has maintained an interest in keeping Akali politics divided by encouraging dissidence within the SGPC. The near-unanimous verdict of the SGPC polls in favour of the SAD on the eve of the assembly elections is a sombre signal to the party. The continuing infighting within the Congress after the assassination of Beant Singh has caused considerable damage. The party was able to win just two of the 13 parliamentary seats, for which the differences between chief minister Harcharan Singh Brar and the then Pradesh Congress Committee president, Virender Kataria, have been blamed. Kataria has since then been replaced by Ambika Soni. Even Brar's cabinet has been reconstituted with Rajinder Kaur Bhathal of the rival group being made the deputy chief minister. Yet there is no let-up in dissident activity. Brar absented himself from a recent Congress rally at Baba Dera Nanak to flag off the campaign for the assembly polls. Rajinder Kaur Bhathal and Ambika Soni made appeals in the name of Beant Singh indicating that Brar is not being allowed to grow out of the shadow of the former chief minister.

Yet all may not be lost for the Congress. The breakup of the SAD-BSP alliance, after the BSP's tie-up with the Congress in Uttar Pradesh, has introduced some fluidity into the political situation in Punjab. For the Congress this is a positive development, hopefully suggestive of a similar arrangement with the BSP in Punjab. The BSP has a base among the Mazhabi and Ramgiri Sikhs who constitute 27 per cent of the population. Moreover, though the Congress managed to win only two parliamentary seats, it did secure 36 per cent of the votes. The SAD, on the other hand, emerging as the winning horse, can expect to witness a reactivation of factionalism as was already evident at its campaign rally at Patiala.

THE ECONOMY

You Too, Dandavate?

HAS even Madhu Dandavate, the current deputy chairman of the Planning Commission, joined the IMF bandwagon? He recently declared that "India's borrowings

have grown indiscriminately". The argument he advanced to support his assertion was that interest payments projected at Rs 60,000 crore in 1996-97 would absorb 46 per cent of the total revenue of the central government. But has he examined why the ratio of the government's interest payments has soared, and that too in the reform years? If his subalterns in the Planning Commission had briefed him properly, the answer would have been readily available to him and he might not have hastened to put all the blame on the supposedly indiscriminate growth of public borrowing. The head of the Planning Commission ought to know that when he rails against public borrowing he is, at the same time, cutting the ground from under his own feet. After all, it is public borrowing which is the principal source of financing available to his Plan. Neither the centre nor the states are able today to generate enough revenues even to cover their non-Plan revenue accounts. So when Dandavate asks for a limit "to be placed on borrowings through appropriate central and state legislations", he is really advocating a limit to be placed on the Plan size. But he is, at the same time, reportedly telling the states that the next Five-Year Plan will be at least twice the size of the Eighth Plan in nominal terms. How serious he is in this regard is open to strong doubt, judging by his exhortation in support of checking public borrowing.

The question that Dandavate fails to answer relates to the factors behind the spurt in the ratio of the government's interest payments to revenue. Let us pose a few questions which he may wish his underlings in the Planning Commission to answer. First, has not the government's interest liability risen faster than public debt? If so, is this not because interest rates on public borrowing have been jacked up substantially as a matter of deliberate policy during the reform years? Second, has the increase in the revenues of the government kept pace with the rise in national income? How is it that while national income has been rising, the already modest ratio of tax revenue to national income has been allowed to decline further during the reform period? If you deliberately let the nominator rise while allowing the denominator to decrease, the outcome will be precisely what Dandavate panics about, at his own expense.

POLITICS

Divided Secularists

FOR all their anti-communal rhetoric, the non-BJP forces are yet to forge unity and offer a viable alternative. Had they been really serious about fighting the menace of Hindu communalism, they could have avoided the division of votes in the assembly elections in Uttar Pradesh that led the BJP to emerge as the single largest party. In the post-election scene, the ambivalent attitude of the opportunist leaders of BSP towards the BJP once again exposed the vulnerability

of casteist politics to the allurements of BJP promises. The experience of the short-lived BSP-BJP honeymoon during Mayavati's tenure as chief minister had evidently failed to teach her and her power-hungry colleagues in her party.

Imposition of president's rule in Uttar Pradesh may be a short-term ploy to keep the BJP out of power, but it is no substitute for a nationwide united offensive to defeat the Sangh 'parivar', in elections and in every other sphere of society. It is the absence of such an offensive that is encouraging fanatics like Bal Thackeray to issue 'fatwas' every now and then and the goons of Bajrang Dal to get away with burning Hussain's paintings. Ironically again, it is the absence of a firm anti-communal offensive that may have forced Hussain to tender an apology. Watching with dismay the 'ratha-yatra' of Hindu xenophobia marching without any resistance worth the name and therefore unsure of support from secular forces, intellectuals and dissenters (especially those belonging to the minority communities) are being forced to remain silent or even recant. The recent court judgment against several Muslims alleged to have participated in the 1993 Bombay riots stands out in sharp contrast with 'judicial inactivism' with regard to those Hindus who had been accused of even more heinous crimes during those riots.

Yet the juggernaut of the Sangh 'parivar' is a monster with feet of clay. Wherever its members have been in office, it has not taken long to demolish the myth of a disciplined and incorruptible force of Hindutva evangelists. In Gujarat, horse-trading among BJP MLAs led to the collapse of the party government there. In Delhi, what with the total collapse of the administration in the face of the dengue epidemic and a fast-deteriorating law and order situation, the BJP government is a divided house, with one group of ministers demanding the ousting of chief minister Sahib Singh Verma. In Maharashtra, apart from the well known links of the Shiv Sena leaders with the Mumbai underworld, the ego-clashes between the BJP and Shiv Sena ministers in the cabinet have already exposed the fragility of the image of strength and solidity. Even in Uttar Pradesh the BJP leadership is divided on caste lines, as is evident from their upper caste leaders' opposition to supporting Mayavati as chief minister.

Such being the situation in the Sangh 'parivar', there is no reason — except their own opportunism in the quest for power — why non-BJP forces should fight shy of launching an all-India campaign exposing the corruption and criminality among the leaders and ranks of the Hindutva brigade.

For once a job that really needs your heart

CRY - Child Relief and You is an independent Indian trust committed to providing comprehensive support to development initiatives with deprived children.

CRY offers career opportunities to committed professionals who would like to use their experience and skills to impact the lives of deprived children.

CRY NEEDS IN MUMBAI

Project Support Co-ordinator

Functions: Evaluation, selection and monitoring of child development initiatives. Extensive travel in rural and urban areas is required for continuous interaction with the projects supported.

Qualifications: Master's Degree in Social Work / Social Science, with 3-5 years experience in the voluntary sector. Proficiency in written and spoken English and fluency in Hindi is essential. Marathi would be an added qualification.

Please call on us with your bio-data and two references by the 27/11/96 at:

CRY - Child Relief and You
189A, Anand Estate
Sane Guruji Marg
Mumbai 400 011
Tel: 3063647/3651/3608

CURRENT STATISTICS

EPW Research Foundation

That the physical infrastructure is emerging as a major constraint to economic growth is evident from the trends in output and supply indicators of the major infrastructure industries: inadequate power generation, growing shortage and rising distribution and transmission losses; reduced production and rising dependence on imports for petroleum and petroleum products; static road length but an explosion in the number of registered vehicles; and extremely poor addition to rolling stock in the railways. The only rapid expansion seen is in civil aviation and telecommunications.

ACC

Capacity Expansion

BETTER known as ACC, Associated Cement Companies is the country's largest cement manufacturer. This Tata group company saw turnover crossing the Rs 2000 crore-mark in 1995-96 with a 13.4 per cent rise in net sales over 1994-95. While sale of cement accounts for 85.1 per cent of the company's revenue, refractories contribute 4.9 per cent and trading of cement/other products account for another 6.6 per cent.

On a 15.5 per cent increase in value of production during the year, the company's total manufacturing expenses increased by a mere 3.2 per cent and accounted for a lower 46.8 per cent of value of production as compared to 52.4 per cent last year. The main raw materials consumed by the company are limestone, granulated slag, gypsum and clay. Helped by the commissioning of the new 1.2 million tonnes per annum (mtpa) clinkering plant at Kymore (Madhya Pradesh), production of cement was higher by 5.4 per cent at 8.93 million tonnes while sale increased by 3.8 per cent to 8.84 million tonnes. The company also achieved the distinction of becoming the largest supplier of refractory products in the country with despatches crossing 108,000 tonnes during the year under review.

A proportionately lower increase in remuneration to employees (up 17.4 per cent) and other expenses (up 14.7 per cent) boosted the operating profit by a phenomenal 57.5 per cent over the previous year, taking the operating profit margin to 19.8 per cent from 14.2 per cent a year ago.

Though the company repaid a considerable part of its term loans during the year, interest cost increased by 19.8 per cent mainly due to a sharp rise in inventory which increased by 38.8 per cent and accounted for 13.5 per cent of sales as compared to 11 per cent in the previous year. Following the commissioning of the new clinker plant, depreciation charge for the year was also higher by 48.5 per cent. Despite a tax provision of Rs 59.5 crore (1994-95: Rs 50 lakh) the company's bottom-line spurred by 45.3 per cent with the net profit margin improving from 8.8 per cent last year to 11.3 per cent. Return on investments was also higher at 16 per cent compared to 10.8 per cent last year while gross value added increased 51 per cent over the previous year and accounted for 40.4 per cent of gross fixed assets (1994-95: 30.4 per cent).

The earnings per share of the company improved from Rs 194.75 (face value Rs 100) last year to Rs 267.9 and its book value jumped from Rs 742.7 to Rs 1,113.7. Encouraged by its improved performance, the company declared a bonus issue in the ratio of three shares for every five shares held. It also raised the dividend to 70 per cent from 50 per cent last year.

During the year under review, the company introduced a new technology of monolithic

lining of ladles in association with Intocast, AG, Germany. The technology finds application in the steel industry. With the commissioning of the synthetic ferric oxide plant at Falta (West Bengal) in September 1995, the largest size roaster (installed for the first time) in the country is now under stabilisation.

With demand for cement on the rise, the company plans to increase its capacity by setting up a new 2 mtpa plant at Wadi. It is also setting up another 1.3 mtpa clinkering unit at Kymore at an estimated cost of Rs 199 crore. The project is expected to be completed in the first half of 1997-98.

As power is a significant factor for production of cement, ACC is making substantial investment in captive power generating facilities of 25 mw each at Jamul and Keymore in Madhya Pradesh. These are expected to be completed in the second half of 1997-98 and will cater to 80 per cent of the company's power requirements.

Meanwhile, moving into its diamond jubilee year, the company has notched up a 4.3 per cent increase in production of cement which stood at 3.14 mtpa in the first four months of the current year as compared to 3.01 mtpa in the corresponding period last year.

BAJAJ AUTO

Market Leader

The largest player in the two- and three-wheeler industry in the country, Bajaj Auto, further consolidated its dominant position in 1995-96 with a 27.8 per cent increase in sales revenue over the previous year. This was considerably higher than the industry average of 21.1 per cent. Value of production was also higher by 28.1 per cent over the previous year and the company managed to increase its market share in the two-wheeler segment to 50 per cent from 48.6 per cent a year ago. Bajaj Auto is followed by TVS-Suzuki which has a 15.5 per cent market share and LML which has a 9 per cent market share. After crossing the one million mark in 1994-95, production of two-wheelers by Bajaj Auto further increased by 13.9 per cent, while that of three wheelers rose by 24.2 per cent. As in the two-wheeler category, Bajaj Auto dominates in the three-wheeler segment with an 87.1 per cent market share and is followed by Greaves (offering the 'Garuda') with a 6.8 per cent share and Scooter India with a 6.1 per cent share.

The cash-rich position of the company was further strengthened with the repatriation of the balance amount of its GDR issue proceeds (Rs 126 crore) which helped it to comfortably tide over the tight-liquidity position obtaining in the economy. This is reflected in the other income component of its total income, which rose by 67.5 per cent during 1995-96 and accounted for 8.1 per cent of total income (1994-95: 6.3 per cent).

Following a lower increase in operating expenses, the company's operating profit

increased by 33.8 per cent over the previous year. The higher offtake resulted in a fall in inventory level by 13.9 per cent compared to a 58 per cent increase in the previous year. Consequently, interest cost for the year actually fell by 13.6 per cent, confirming the company's good liquidity position. A proportionally lower increase in depreciation (up 25.7 per cent) and tax provision (up 23.3 per cent) also helped the company post a comfortable 34.7 per cent rise in net profit during the year under review.

Exports of the company increased by 46.6 per cent over the previous year. Gross capital formation increased by 32.1 per cent during the year, improving considerably over a 16.8 per cent rise last year. In keeping with its past policy, the company has retained up to 80 per cent of net profits despite an increase in dividend rate to 100 per cent from 80 per cent last year. Consequently, the company's book value was further strengthened to Rs 177 from Rs 135 a year ago. Earnings per share (EPS) also jumped from Rs 38.9 to Rs 52.4 over the same period. Currently quoting at around Rs 927 on the bourses, the company's share price discounts its 1995-96 earnings a comfortable 17.7 times.

During 1996-97 the company plans to introduce a 125 cc 2-stroke motorcycle, a 60 cc two-wheeler with modern styling (Cygnet), the new M-80 motorbike, the new Classic and a diesel rear-engine autorickshaw. For the first four months of the current year the company has already notched up a turnover of Rs 1,134 crore, a rise of 29 per cent over the corresponding period last year.

TATA CHEMICALS

From Soda Ash to Urea

The largest player in the soda ash industry, Tata Chemicals, has a 42 per cent share of the market. However the company began drawing the larger part of its revenue from fertilisers in 1995-96. The new fertiliser plant, set up in Babrala (Uttar Pradesh) with a capacity of 7,42,500 tonnes per annum and commissioned in December 1994, operated at 113 per cent of its capacity in its very first full year of operations.

During 1995-96, the company saw a 107.1 per cent rise in sales and a 113.8 per cent increase in value of production. Production of soda ash increased by 7.1 per cent over the previous year and sale quantity was higher by 5.9 per cent. Due to better realisations from soda ash following the increased demand, sale revenue increased by more than 20 per cent over the same period. Production of urea increased sharply from 1,74,630 tonnes in 1994-95 to 8,40,128 tonnes during the year under review and sale was also higher at 7,84,486 tonnes (1994-95: 1,66,190 tonnes).

Despite the sharp increase in value of production (VOP), total manufacturing expenses increased by a lower 49.1 per cent and accounted for 32.9 per cent of VOP

compared to 47.2 per cent in the previous year. The main raw materials required by the company include salt, coke, natural gas, limestone, liquid ammonia, ammonium chloride and sulphate of ammonia. Among these, salt is a major raw material as most of the other chemicals manufactured by the company are derived from it. Similar lower increases of 13.1 per cent in remuneration to employees and 13.3 in other expenses helped the company post a phenomenal 140 per cent rise in operating profit. There was a non-operating loss of Rs 8.6 crore in 1995-96 mainly due to loss on sale of investments and prior year adjustments and this limited the rise in net profit. Compared to this, there was a non-operating profit of Rs 111.3 crore in the previous year due to sale of assets. A substantial spurt in interest cost (up 143.7 per cent), depreciation (up 128 per cent) and a tax provision of Rs 22 crore (1994-95: nil) further restricted the rise in the bottomline to 36.9 per cent.

After issuing bonus shares in the previous year in the ratio of three shares for every five held, in the previous year, the company maintained dividend at last year's level of 65 per cent. Consequently, dividend outgo was substantially higher at Rs 117.5 crore (1994-95: Rs 73.4 crore).

Due to erratic availability of natural gas for the fertiliser plant, the company has set up a naphtha desulphurisation unit in order to operate the new plant with a mixed feedstock of natural gas and naphtha. The purge gas recovery plant was also completed during the year and both these have been connected to the main plant during the annual shut down (for repairs and maintenance) in April 1996. Major components of the Mithapur Vikas Plan, an extensive modernisation and expansion plan undertaken by the company, were also completed with the commissioning of the co-generation plant in May 1995 and the 100 tonnes per day new membrane cell caustic soda plant in July/August 1995. The capacity of the soda ash plant is also being expanded to one million tonnes per annum over the next 12 months. The company has, meanwhile, initiated a Rs 455 crore modernisation programme at Mithapur and this is expected to be completed over the next two to three years. The company is also planning a major diversification into power generation and will be setting up wind energy generating capacity at its 37,000 acre site at Mithapur.

For the first quarter of the current year, 1996-97, the company has reported a 17 per cent increase in sales to Rs 521 crore.

Meanwhile, the company is facing a total income tax liability of over Rs 200 crore pertaining to assessment years 1992-93, 1993-94 and 1994-95. This was due to rejection of certain deductions claimed by the company with regard to its fertiliser unit. If the claim materialises, it could be a serious drain on the company's resources. Though it has appealed to the Income-tax Appellate Tribunal against the I-T Department, the company's share price has plummeted on the Bombay Stock Exchange to around Rs 206 from Rs 224 a year ago.

Strategies may change in tandem with changes but our ethos and the commitment to our established values remain not.

Excerpts from the speech delivered by Shri A D Navaneethan, Chairman of the Bank at the 77th Annual General Meeting of the Shareholders held on the 18th September 1996 at Karur.

Ladies and Gentlemen,

At the outset, I extend to you all a very warm and cordial welcome to the 77th Annual General Meeting of the shareholders of the Karur Vysya Bank Limited coinciding with the Bank's 80th Anniversary.

Since we met last, new shareholders have joined the growing KVB family and I extend them a hearty welcome. The Directors' Report and audited accounts of the Bank for the period ended 31st March 1996 have been with you for quite a while and with your kind permission, I shall take them as read.

80 YEARS IN THE SERVICE OF THE CUSTOMER

It indeed gives me immense pleasure to greet you all on the momentous occasion of your Bank's 80th Anniversary being celebrated from the 1st July 1996. I could only feel great share holders family and the robust your Bank and rejoicing dynamic Completion of important the history of institution founded by sighted pioneers, way back in 1916 and this highly significant landmark takes us back to the memories of the finest hour when our Bank was set up by them with vision and prescience. At this great distance of time, let us all gratefully recall the valuable and lasting contribution made by them in promoting and nurturing your Bank which is now 80 years young and has been growing steadily to emerge as a leading one. Living upto the lineage left behind us by the illustrious Founding Fathers of the Bank would indeed be a fitting tribute to their genius. If we look deeper into the past, we could definitely look into the future with confidence to carve out a place of pride for the Bank in the banking fraternity.

FIRST AMONG THE BANKS IN THE PRIVATE SECTOR

When I met you last, you may recapitulate about my mentioning of our Bank having been rated as one of the Top Five banks in the private sector in the country by the BT-CRISIL SURVEY OF BANKING. You will now be delighted to note that the good performance of the

Bank has once again been duly recognised by being rated as the First among the banks in the private sector and THIRD among all the Indian Scheduled Commercial Banks by the same Survey based on 1994-95 results. It is quite a crowning achievement considering the competitive banking ambience of the day. Your Bank's elevation to the top has been the result of dedicated and single-minded devotion of a large number of people who gave their very best to the Bank. In this connection, I would hasten to acknowledge that this enviable achievement could not have been possible but for your encouragement and most important of all, your understanding and unflinching support to the Management.

PERFORMANCE HIGHLIGHTS

During the year under focus, your Bank has posted encouraging results in all crucial areas of banking though 1995-96 was admittedly an unusual and unprecedented year. The year gone by saw severe liquidity constraints stemming from deceleration in the Capital Market, volatility in the Forex and Money Markets, increased propensity to hold cash assets by the public, intense competition from non banking institutions especially the unincorporated ones, and a host of such other adverse trends which manifested themselves in the sluggish growth of deposits in the banking system. Against this backdrop, your Bank could not have remained insulated from such uncongenial factors and the deposit growth of the Bank also decelerated. Thus the deposits of the Bank stood at Rs.1158.80 Crores as on 31st March '96. We have been constantly reorienting our deposit rates in concert with market trends to remain competitive in the system. The Bank is redoubling its efforts to mobilise additional resources.

1995-96 fiscal witnessed an unprecedented surge for bank credit and it was one of too many bankable assets chasing too few funds at the command of the system. Banks were thus operating in an environment where the demand for funds was quite strong and opportunity to create good assets was also high enough but there was a growing chasm as between supply and demand for funds leaving the demand largely unmet. Against this background, the advances of the Bank stood at Rs.824.30 Crores at end March '96 as against Rs.649.24 Crores a year ago, clocking a growth of 27%. While extending credit, the quality of loan assets was continued to be ensured. You will no doubt appreciate that the level of Non Performing Assets provides an important and useful measure of performance of a bank as it is reflective of the health of its loan portfolio. You will be pleased to note that the percentage of non performing assets of your Bank was 1.67 in March '96 - perhaps the lowest in the system and a significant drop from 2.16% a year ago thus reflecting our sensitivity to the quality of the loan assets and you may no doubt, like to distinguish this level with that of the system labouring with NPAs as high as about 16.5%.

As in the past, the Bank has been extending timely and adequate credit to the priority sector borrowers and we will ensure further flow of credit to this preferred sector including agriculture. The Bank has been extending need based credit to the export sector with a view to stimulating exports and as a result, the Bank's export credit registered a growth of 66% over the previous year and continues to be far well above the stipulated level of 10%. The Bank is having active Dealing Room with updated information facilities including Reuter Screen. The FX Turnover of the Bank including inter bank transactions during the year has smartly crossed Rs.6000 Crore mark.

The investments of the Bank stood at Rs.407.83 Crores as against Rs.430.69 Crores as on 31st March 1995 shedding excess investments. The judicious funds management has resulted in improving the average yield on investments in Government and other approved securities to 12.52% during 1995-96 as against 12.35% a year ago. The Reserve Bank of India has been

advising banks to progressively move towards the international practice of valuing all investments on fully 'marked to market' basis and in this light, the ratio of permanent and current categories of investments for the year under review has been stipulated at 60:40; but your Bank is already prudently maintaining a better ratio of 50:50. The value of the investments in Government Securities suffered a set back when the yield to maturity for ten years was increased from 13% to 14% for the last fiscal as a result of which many banks including yours had to provide substantial depreciation for the resultant erosion in the value.

HEALTHY BOTTOMLINE

Fierce competition for business, fluctuations in the exchange value of rupee, increase in the operational expenditure and such other adverse developments strained the margins available to banks and skewed the profitability of their operations. Thus the profitability of many a bank was impaired because of ramification of operational compulsions and felt very much short of their expectations. But, you will be pleased to note that your Bank has posted a creditable profit of Rs.32.24 Crores during 1995-96 - a growth of 40% as against Rs.23.06 Crores a year ago. I am sure that you will be viewing this profit growth as encouraging given the lower profitability trends experienced by the system. Incidentally, the profit figure is in line with that indicated earlier in our Offer Letter for Rights Issue in 1995. You will also be glad to note that thanks to surge in profit, the earnings per share continue to be as high as Rs.53.87 and that too on the enhanced Capital. Further, your Bank occupies the first position among the Tamil Nadu based private sector banks in the profit position about which, I am sure that you will be justifiably proud. Constant efforts are on to increase the profitability of our operations by further fine tuning our funds management, aided by mobilisation of low cost deposits with added focus on non fund based business and of course deploying our loanable funds in profitable niche areas of business.

STRONG CAPITAL FUNDS

Having regard to the imperative need to build up Reserves - shareholders funds - the Bank has been appropriating a lion's share from the net profits to the Reserves. Thus, the Capital and Reserves of our Bank have sharply increased to Rs.88.71 Crores as of March '96 as against Rs.52.86 Crores a year ago or a growth of 68%. The Paid-up Capital of the Bank stands increased to Rs.5.98 Crores with issuance of Rights Shares in 1995. The Book Value of the share went up to Rs.148.23 in March '96 as against Rs.132.15 a year ago, that again on an expanded Capital base. The Bank's Balance Sheet has thus become dynamic and strong. I have every hope that the Capital Funds of the Bank will grow substantially by turn of this fiscal to touch the magic figure of Rs.100 Crores. The Capital Adequacy Ratio of the Bank continued to be maintained at a higher level at 10.92% as of March '96 as against the stipulated norm of 8% despite the increase in assets base.

GROWING CONCERN FOR THE SHAREHOLDERS

You will readily agree with me if I say that the return on shareholders' funds has shown a marked upturn driven by strong profit growth year after year and the Bank has been paying attractive dividends as well. What has come from the shareholders has gone back to them many times over. Enthusiased by the profit performance during the year and to carry the happy memories of the Bank's 80th Anniversary, your Board of Directors have happily recommended a dividend of 50% subject to the approval of the Reserve Bank of India but approval has been received only for 45%. However this dividend is the highest so far, both in terms of percentage and quantum. Thus it will gladden you to note that paying dividend consistently and at enhanced level over years.

stands a testimony to our growing concern to reward our shareholders.

IN-TECH FOR CUSTOMER SATISFACTION

Information technology has a crucial role to play in the success of banks as elsewhere. It is marching as a major instrument to meet the challenges in terms of profitability and productivity. It is increasingly perceived as a device to transform enterprises than just a vehicle for automating functional tasks. Today's competitive milieu is forcing banks to distinguish them from others through quality services. Threats of competition have forced the banks far from being mere mobilisers of resources and purveyors of credit into a host of new services like personal banking, Credit Card support, tele banking or the like. The push from the technology and the pull from competition have brought about radical changes albeit with initial hiccups and there is continuous revolution in this area. Newer and better technologies are knocking the doors everyday and we fully recognise that it is important to stay alive to these changes. I am happy that there is a greater and welcome awareness among my colleagues that we have come to such a pass that a growing organisation like ours could ill afford to function without information technology.

It is also well recognised that a bank which is not offering services that computerisation brings in, will not have a promising future. Computerisation and modernisation of our operations therefore continue to receive our pointed attention just to meet the twin objectives of customer satisfaction and informed managerial decision making. With a view to providing quicker and responsive customer service and staying alive to the changing environment, the Bank has increased the number of computerised branches. The Bank has already fully computerised 32 branches. Plans are on hand to computerise more branches during the current year. Foreign Exchange operations at our International Division, Madras have been fully computerised with on line computer system. The foreign exchange operations of four B category branches have also been computerised during the year. At the Central Office, maximum level of computerisation has been reached. Moves are on to link the branches through updated network system.

NEW FACE OF BANKING

Economic liberalisation measures ushered in since mid '91 have substantially transformed the banking turf and its complexion. Banking reforms have been in place for the past few years in the form of sharpened prudential norms, strengthening of the supervisory framework by the central banking authorities, dilution in the regulation of interest rates, upgradation of technology, softening of statutory pre-emptions, more transparent accounting practices, relaxation in the forex regime, entry of new private sector banks and foreign banks, and the like. Market related reforms have brought in train, tremendous pressures on banks as they have to confront the intensity of business competition on both sides of the equation resulting in change in their style of functioning. It is a tribute to the bankers to have deftly managed and adjusted to the twists and turns in the market. Perhaps it is time that a level playing field was also ensured for all the players in the banking scene especially when uniform standards are sought to be applied regardless of banks' ownership and origin. Such equal opportunities will bring out the best in the system and ensure the Survival of the Fittest.

FUTURE TRENDS

Economic growth is expected to be firm in the medium term and we are hopeful of riding on the resultant demand for banking services to improve our bottom line. We would focus increased attention to capitalise the opportunities to finance rapidly emerging middle level borrowers, small and dynamic new firms, mid-sized corporates, upcoming traders and growing service industry. Given the draft on the resources available to the banks thanks to the extant statutory pre-emptions and also the increasing trends in the cost of funds, one cannot foresee softening of the interest rates in the short run and the margins are also likely to be under pressure in the current fiscal as well. Managing cost and productivity will, therefore, continue to be our main refrain. We are extremely alert over the emerging market forces demanding our constant attention. We believe that we have resilience and vibrancy to absorb such changes.

NO EXCESS IN CUSTOMER SERVICE

In the present day market driven economy, it is the customer who calls the tune. The success of a business is very much determined by the degree of success achieved in satisfying the customer, more so in the banking. I would define our success in terms of profitability and customers' perception about us, not necessarily by size or volume. Profit comes from the satisfied customers boasting about our services and schemes and I would very much like such tribes multiplying. We have always been tailoring our services to meet customers' growing expectations and aspirations. Luckily, my colleagues know only too well that the Bank driven by customers satisfaction will alone have a competitive advantage. In customer service, my colleagues will aver that there is no excess as such and they are very conscious that the customers do not want to be treated en masse but as individuals.

BUILDING UP PEOPLE

Banking, in the main, is all about total commitment to anticipating and serving the customers' needs and that is exactly what we are upto. This brings us to the quality of manpower that is not only allowed to exhibit its full creativity and talent but enlarged, encouraged and rewarded for being so. Our success in the ultimate analysis, hinges on the hardwork and commitment of the members of the KVB family. In view of the seismic changes in the environment and growing complexities in the banking operations, there is an imperative need for training the staff to enable them to acquire the needed skills to sharpen their competitiveness, excellence, refinement and innovation in their respective work areas. Necessary inputs are therefore being provided to them to develop their individual skills through extensive training programmes in all vital areas such as credit appraisal, Forex, use of modern technology and inter personal relationship.

Any business unit can accomplish its work only as well as its employees can and this presupposes a motivated staff ready for attitudinal changes. A lot has therefore been done in this area. The welfare of the employees has always been the lead agenda of the Management which has been amply demonstrated time and again. I am very happy that all my colleagues are on the right course to face the impending changes in the operational environment. Balance Sheet is not the only reflection of our Bank's success, but those who are hidden behind it that matter most - 2300 plus KVB family members and of course, your dynamic and enlightened Board of Directors to guide the fortunes of the Bank.

GRATEFUL ACKNOWLEDGEMENTS

I record with deep sense of sorrow the sad demise of Shri M V LAKSHMINARAYANA GUPTHA, President of the Bank (1963-1970) on 25th February 1996. Let us all reverentially recall the sterling services rendered by him for a period spanning more than four decades for the sustained growth of the Bank.

The Bank has been very fortunate to have committed, articulate and well meaning Directors on your Board and because of their matured counsel and guidance, the Bank has reached a level in which it finds itself today. It has been my very great privilege to enjoy their support, confidence and guidance and I hasten to thank my illustrious colleagues on the Board. I would look forward to having the continued benefit of their unsolicited support, timely guidance and beneficial advice in abundant measure for taking your Bank to still a higher growth point. I would happily place on record the valuable services rendered by Sarvaswathi S Rangarajan, Additional Director and G. Gopalakrishna, Alternate Additional Director of the Reserve Bank of India who have ceased to be in the Bank's Board since we met last. The Reserve Bank of India has appointed Shri R. Sahadeva as Additional Director and Shri F. R. Joseph as Alternate Additional Director on the Board.

Since 1916

KARUR VYSYA BANK LTD.

Regd. Office & Central Office: Karur - 639 002.

The Bank That Builds Confidence.

with effect from 12th October 1995. I take this opportunity to welcome them to our Board.

We continue to receive valuable advice, good guidance and timely support from the Reserve Bank of India and its nominees on the Board and I gratefully acknowledge their support and encouragement.

I also take this opportunity to thank IBA, IDBI, SIDBI, NABARD, SEBI, LIC, UTI, GIC, DFHI, ECGC, DICGC, STCI, ICICI, FEDAI, NSE, Madras Stock Exchange, Coimbatore Stock Exchange and the banking fraternity at large for their co-operation and assistance given to your Bank. I earnestly look forward to having the benefit of their ongoing support. On an occasion like this, it is my pleasurable duty to thank profusely our valued clients on behalf of the Board and on my own for their continued support, patronage and encouragement but for which the Bank could not have emerged strong with healthy fundamentals.

The Bank is proud of having you as its shareholders and you should also be equally proud of being the shareholders of the Bank which is always on the move. The loyalty of the shareholders has been the main driving force for the Management. Your interest has always been and will ever be high on our agenda. Your expectations and aspirations to take the Bank to a still higher growth level will find expression in our total commitment for the same and your Bank will always be shareholder and customer-intimate Bank. It is my great pleasure to thank our shareholders for their enduring trust and abiding confidence in the Management which only have stood us in good stead in taking the Bank to the frontline.

It is in the fitness of things that I should place on record my deep appreciation of the valuable contribution made by all the members of our staff for the sustained growth of the Bank. I have abundant confidence in my colleagues that they would be second to none in their efforts to take the Bank to a very prime position and to copewith the urgencies and requirements of business development.

CHANGE IS REPETITIVE

Banking needs are changing and we are cognisant that we have to move very fast and without complacency to seize and capture the available business opportunities. We have the requisite courage to take responsibility to experiment in altogether different environs. In today's demanding world, we will be able to survive only with discretion and sharp edged decisions. Prudence, thrift and ingenuity will have to be the watch words and we are conscious that those who adopt them will prosper and we are imbuing these attributes in our stride. In the fast changing world, change is repetitive. Change is the only phenomenon not subject to change. Change is at times uncomfortable. It is but in one's nature to feel secured with what is familiar and feel rather threatened by any change, but the genius lies in our anticipating and responding to change not only to thrive but thrive adroitly. We are in the twilight years to reach the end of the Millennium by when your Bank should be riding high with towering business volume and emerging as a model bank with a pre-eminent position. Our strategies may change in tandem with changes but our ethos and our commitments to our cherished values will not. We will certainly strike a golden mean as between continuity and change.

It is indeed very nice to have you all today for the Annual General Meeting of the Bank. Good Luck to you.

Thank you.

Note: This does not purport to be a record of the proceedings of the 77th Annual General Meeting of the Bank.

Anugrah 23/18/96

Credit Policy Skirts Basic Issue

With the latest monetary policy announcement confining itself to the essentials of the stabilisation and structural adjustment programme, the mismatch between an abundance of liquidity in the system and industry craving for funds for investment has remained unaddressed. Money market developments, after the credit policy announcement particularly, have once again thrown into sharp focus the narrow groove in which the banking system has got stuck and the rigidity in the operations of banks and financial institutions encouraged by the limited perspective of financial sector reforms.

I The Policy Backdrop

THE initial expectations regarding the monetary policy measures that were due to be announced in mid-month and the subsequent easing of liquidity beyond market expectations dominated the money market behaviour during October. However, with the policy confining itself to the essentials of the stabilisation and structural adjustment programme, the slip between the cup and the lip, the mismatch between the abundance of liquidity and the industry craving for investible resources at reasonable cost has remained to be addressed. The immediate effect of the policy has been seen in a falling trend in short-term interest rates and a further boost to the government securities market. The authorities have recognised the need for banks to provide adequate credit to the productive sectors and bring down their lending rates, but the measures taken such as the two percentage points reduction in the cash reserve ratio (CRR), raising of the export credit target from 10 to 12 per cent of each bank's net credit, reducing somewhat the cost of export credit, permitting banks to lend their FCNR(B) funds as foreign currency denominated loans for borrowers' foreign currency or rupee requirements and the one percentage point reduction in deposit rates are found to be insufficient, though essential, to achieve a sharp reduction in the average lending rates of banks and financial institutions and to induce banks to expand their credit base rather than focus on treasury operations and dealings in government securities. Such an attitudinal shift amongst banks cannot be expected to take place also because the policy measures avowedly seek to bring about closer links between the money, capital, gilt-edged and foreign exchange markets. The low CRR-low refinance regime now propounded, the facility for foreign currency loans to domestic borrowers irrespective of whether for their foreign currency or rupee requirements, the total delinking of the issue of commercial paper

(CP) from cash credit for large borrowers, the abolition of selective credit controls on almost all sensitive commodities (except the buffer stock and unreleased stocks of sugar with sugar mills) and, above all, the permission granted to banks to purchase shares and debentures in the secondary market fall into this category of the authorities' attempts at integrating markets which in fact have been responsible for taking banks away from their traditional role of providing commercial credit and promoting real sector growth.

The money market developments, particularly after the credit policy announcement, have brought into sharp focus the narrow groove into which the banking system has fallen and the rigidity in the operations of banks and financial institutions (FIs) which has been generated by the narrow perspectives inspiring financial sector reforms. Banks have continued to surrender the liquidity released by the RBI back to it by slashing their use of refinance. Between March 31 and October 18, banks (including NABARD) reduced their borrowing from RBI by Rs 14,458 crore, thus offsetting the benefit of CRR reductions. Between March 29 and October 25, the expansion in non-food credit of scheduled commercial banks dwindled to Rs 2,284 crore against Rs 13,525 crore in the corresponding period of the previous year, while their investment in government securities went the opposite way: an increase of Rs 14,156 crore against Rs 8,643 crore last year.

Apart from lending activity taking a back seat, the relative rigidity in the lending rate structures of banks and FIs has resulted in the cost of financial intermediation playing a deleterious role in sustaining industrial growth. There was a time when high reserve and liquidity ratios as also cross-subsidisation in interest rates were claimed as constraints on reducing the banks' general lending rates, but now the competitive cost of deposits and other funds, rigorous application of capital adequacy and provisioning norms and the dominance of the bottomline in factoring lending rates have introduced considerable

rigidities in the rate structures of banks and FIs. The declines in inflation rate, sizeable reductions in CRR and SLR, narrowing of the degree of cross-subsidisation in interest rates and the abundance of liquidity have all been ignored or overwhelmed by the free play of market forces which have spawned those rigidities – a distinct lesson in market failure which the authorities have failed to recognise and effectively act upon. Though the banks and FIs have reduced their prime lending rates (PLRs) by 0.5 to 1 percentage point as a token gesture to the mounting pressure from the RBI and the ministry of finance, they find it exceedingly difficult to initiate any true and meaningful reductions in their loan rates as they have committed themselves to high cost borrowings. Competitively high deposit rates for above one-year maturity paid by banks, such high rates as 16 to 16.5 per cent or over paid by IDBI and other FIs on their funds, and deep discount and such other immeasurably high-cost sources of long-term borrowings would persist as serious constraints on effecting any significant downward adjustment in lending rates in the foreseeable future. This is compounded by the vicious circle that has set in, in that the adverse consequence of prohibitively high interest rates is already reflected in the distinct slow-down of industrial activity which in turn has probably resulted in reduced demand for bank credit. The way out for breaking the vicious circle would lie in providing a decisive expansionary impulse from fiscal and monetary policies in a co-ordinated manner. To achieve it the authorities will have to live down their commitment to the conventional variety of structural adjustment which has been so harmful to the working of the economy and responsible for divergences between financial sector and real sector activities.

II Money and Foreign Exchange Markets

With robust deposit growth and the lack of credit expansion, the liquidity situation remained comfortable throughout the month. Having completed over 75 per cent of its borrowing programme, by the early part of October, the government too preferred to wait a while so as to benefit from the expected declines in interest rates on the rest of its borrowings. A remarkable aspect was the marked stability displayed by the call money rates which generally hovered between 9 and 10.50 per cent during most period of the month (Table 1). The coefficient of variation (in percentages) fell from 60 in September to 15 in October (Table 2).

Opening at 10.5 per cent on October 1 and ruling at around that level in the first week, the call rates began to edge downwards to

GRAPH A: DAILY TOP-END QUOTATIONS OF CALL MONEY RATES, AUGUST 1996 TO OCTOBER 1996

about 8 per cent by October 9, following widespread expectations of a CRR cut. Until the credit policy announcement on October 19, the rate ruled between 9 and 10.25 per cent. A large part of the call money borrowing, mostly by foreign and private banks, was utilised for funding the purchase of government securities with the sole purpose of booking profits after the credit policy.

Following the two percentage points cut in CRR, the market psychology became one of easiness but the overnight rates remained at around 9 to 10 per cent as the banks had surrendered almost all of their refinance facility to the RBI and as the first tranche of the four-step cut in CRR of 0.5 percentage each was becoming effective only on October 26; thereafter call rates did fall to a range of 2 to 4 per cent towards the end of the month (Graph A).

Forex market

The exchange rate for the rupee also remained unusually stable during the month with the rupee-US dollar rate remaining range-bound at Rs 35.60/70 (Graph B). The relative stability in exchange rate was due to

the RBI's constant purchase operations whenever GDR money inflows took place. In the initial part of the month, there were reports of GDR inflows which brought down the RBI reference rate from Rs 35.76 per US dollar to Rs 35.62/63 until October 9 and thereafter to Rs 35.63/66 until October 18. During the week ended October 11, the RBI foreign currency assets also expanded by \$290 million. Besides, SBI which raised GDRs worth \$369.95 million at Rs 35.51 started bringing back the dollars in tranches so as not to destabilise the exchange rate. SBI sold some forex at Rs 35.61, thereby reaping some capital gains.

GRAPH B: SPOT QUOTATIONS FOR THE US DOLLAR IN THE DOMESTIC INTER-BANK MARKET

The nominal exchange rate began to appreciate and touched Rs 35.58-35.61 a US dollar after October 22 due to the announcement effect of allowing banks to use their FCNR(B) deposits totalling about \$5.7 billion as foreign currency loans or rupee loans to corporates. Secondly, the forex market witnessed sudden surge in capital inflows on account of FIIs' net investment of \$142 million immediately after the credit policy announcement during October 19 to 24 as against that of a meagre \$2 million during October 1 to 18.

The most important consequence of the new credit policy on the forex market was the

GRAPH D: YIELD CURVES FOR 364-DAY TREASURY BILLS AND DATED SECURITIES - WEIGHTED AVERAGE FOR OCTOBER 1996

drastic fall in forward premia for the US dollar both due to the anticipated domestic liquidity bulge and the possibilities of forex lending through FCNR(B) funds (Graph C). The annualised six-month premia which prevailed in the range of 8.5 to 9 per cent until October 18, dropped to 7 per cent on October 22 and reached 6.50 per cent towards the end of the month. The fall in forward premia was basically due to precipitous

selling of foreign exchange forward by exporters and stoppage of banks' swapping activities as they could now prefer direct forex lending of FCNR(B) deposits rather than rupee lending through swaps.

The sustained decline of the forward premia, in the face of virtual absence of the RBI in the second half of the month, reflects the growing integration between money and forex markets, with the forward premia

tending closer to the money market rates. The outstanding net liabilities of the RBI in the forward market, which peaked at \$2,316 million as at the end of February 1996, declined to \$1,799 million in June 1996 and further to \$1,107 million at the end of August.

The decline in forward premia also provided arbitrage opportunities for banks. As observed during the second half of the month, banks reverted to the old practice of

* Devolvement on primary dealers, exclusive of RBI. ● Outstanding amounts are estimated for last few weeks of October 1996.

soliciting FCNR deposits from NRIs at 7 per cent. Banks, in turn, lent the same NRIs or designated counterparts at 6.5 per cent which are being funded through borrowing at LIBOR plus rate of around 6 per cent. Simultaneously, the banks convert the FCNR deposits into rupees which are on-lent at 19 to 20 per cent, thereby yielding arbitrage benefit of 4 to 5 percentage points after the netting of forward premia and FCNR deposit rates.

III Primary Market in Gilt-edged and Other Debt Instruments

Dated Government Securities

Consequent upon mounting criticism levelled against the commission-sharing tendency of primary dealers (PDs), it was decided by the PDs to (i) form a self-regulatory organisation, (ii) stop bidding on behalf of the non-PDs, and (iii) ultimately to stop sharing commission. As a result, the lone issue of government paper on October 7 worth of Rs 2,000 crore through the 4-year zero coupon bond 2000 (third series, second issue) witnessed about one-fourth devolvement of Rs 506.99 crore which was borne by RBI (Rs 454.26 crore) and PDs (Rs 52.73 crore). This happened despite the fact that the pre-determined discount price was Rs 60.66 which continued to provide a high yield of 13.73 per cent per annum. With this the government have already effected a net market borrowing of Rs 19,146 crore out of the budgeted amount of Rs 25,498 crore, i.e., about 75 per cent.

91-day Treasury Bills

Due to abundance of short-term liquidity, the 91-day TB auctions have been receiving overwhelming response from both the competitive and non-competitive bidders since the last week of September. Even so the yield rate on the TBs continued to remain out of alignment, with the rate peaking in the recent period at 10.17 per cent towards the end of September and early October. In the subsequent auctions of October 11 and October 18, the competitive amounts bid were phenomenally large at Rs 968 crore and Rs 676 crore, respectively and yet the yield fell only fractionally to 10.09 per cent and 10.05 per cent, respectively. Even the weighted average of the yield offered in the first three auctions were high at 10.13 per cent, 9.96 per cent and 10 per cent, respectively, thus signifying that there was no decisive signal from the central banking authorities on curbing excessive market expectations. Such a signal did come about when the government expressed its anxiety to soften interest rates and help revive the economy, as also reduce the interest burden on the budget, which was finally reflected in the new credit policy. As a result, the last two auctions of October 26 and November 1, saw not only large bids but also bids at drastically

reduced rates. The cut-off yields dipped to 8.83 per cent and 6.92 per cent, respectively (Table 3). Interestingly, the market perception was also so radically altered as to see a much sharper decline in the weighted average yield to 8.67 per cent and 6.79 per cent, respectively, in the above two auctions.

364-day TBs

The two auctions of 364-day treasury bills in October told a slightly different story: overwhelming response combined with less change in YTM. On the October 9 auction, RBI received bids amounting to Rs 880 crore from 27 bidders and accepted Rs 834 crore – almost 95 per cent of the bid amount, because the cut-off yield was held constant at 12.61 per cent. However, on the October 23 auction, the RBI's new-found enthusiasm to initiate a low interest regime, induced by the government's anxiety to arrest the growing interest cost on the budget, forced it to reduce the cut-off yield to 12.10 per cent and accept only 4 bids for Rs 151 crore – a meagre 12 per cent of the bid amount of Rs 1285.05 crore from 54 bidders. Such a lowering of the cut-off yield was possible only by rejecting as much as 88 per cent of the bid amount, implying that the change in

the market expectations was not seen in 364-day TBs, unlike in the 91-day TBs. The weighted average of yields bid fell by 48 basis points from 12.55 per cent in the first auction to 12.07 per cent in the second auction as against a fall of 51 basis points in the cut-off yield (Table 4).

Operations of Primary Dealers

Three primary dealers (PDs), viz, Discount and Finance House of India (DFHI), Securities Trading Corporation of India (STCI) and I-Sec, published their balance sheets during September. The other three PDs are yet to complete their first year of operations.

Reading of the balance sheets of the three PDs makes interesting revelations. First, there is no uniformity in publishing the information relating to PD business. In fact, in the table below, I-Sec information could not be included as its balance sheet does not give data relating to its PD business separately. This is significant as the PD guidelines issued by the Reserve Bank clearly requires that the PDs should have separate trading desks and should maintain separate accounts. This is necessary not only from the viewpoint of transparency but also as, while operating in

TABLE 4: AUCTIONS OF 364-DAY TREASURY BILLS

(Amount in rupees, crore)

Date of Auction	Bids Tendered		Bids Accepted		Cut-off Price (Rupees)	Cut-off Yield Rate (Per Cent)
	No	Face Value (Amount)	No	Face Value (Amount)		
1995						
Oct 11	18	135.00	5	11.00	88.55	12.93
Oct 24	18	121.00	9	76.00	88.54	12.94
1996						
Oct 9	27	879.00	23	834.00	88.80 (88.85)	12.61 (12.55)
Oct 23	54	1285.05	5	151.00	89.21 (89.23)	12.10 (12.07)

Figures in the brackets represent weighted average price and the respective yield.

TABLE 5: PERFORMANCE NORMS AND ACHIEVEMENTS OF PDs, 1995-96

	RBI Norms	DFHI	STCI
Success ratio in committed bids			
Government Securities	33.33 Per cent	59.56 Per cent	58.67 Per cent
Treasury bills	40.00 Per cent	46.68 Per cent	53.00 Per cent
Annual turnover of total purchases and sales during the year as ratio of the average of month-end stocks		(Rupees, crore)	
	G-secs: not less than 5 times	60,143 (78.82 times)	170,282 (206 times)
	TBs: not less than 10 times	13,491 (24.98 times)	2,674 (25 times)
Of the total, turnover in out-right transactions			
	G-secs: not less than 3 times	548 (1.12 times)	1,879 (5 times)
	TBs: not less than 6 times	2,569 (5.80 times)	2,416 (24 times)

the government securities market, PDs have to keep a firewall between all its businesses. It was reported that one PD was caught by the RBI for diverting funds borrowed from the call market as PD to deploy in its sister concern doing broking business. It is very crucial that PDs as upcoming institutions and having para central banking status insofar as the public debt function of the central bank is concerned, maintain a very high standard of business ethics. While DFHI and STCI reports are largely comparable, in details they too differ *albeit* to a much lesser extent. Their performances are compared in Table 5 against the RBI norms for PDs.

It can be observed from Table 5 that the performance criteria in terms of success and turnover ratios are by and large met. The performance of these two institutions also clearly shows how vulnerable these institutions are to the vagaries of the market forces. For instance, DFHI has expressed some difficulty in achieving the ratios in outright transactions. This, as explained by DFHI, is on account of the level of 364-day TBs in the system which had declined sharply during 1995-96 whereas most of the 91-day TBs stock was taken up by non-competitive bidders and RBI (82 per cent). In the government securities section, the ratio could not be achieved as banks in the wake of liquidity crunch of the last year were heavily dependent on repo market rather than outright sale or purchases to raise funds. DFHI's turnover ratio also could be low as it being an older institution, may have worked on a larger base of securities than the newer institutions. The STCI too has done a huge turnover in repos than outright deals for the same reason.

STCI report also reveals that out of total 239 outright sale transactions, 147 transactions resulted in trading profits and 92 in trading losses. While trading profit was Rs 4.13 crore, trading losses were Rs 5.29 crore. As a result, STCI made a net trading loss of Rs 1.16 crore. Out of this, losses worth Rs 1.08 crore were incurred in periods between January-March 1996 when the money and forex markets experienced extreme volatility and tightness. These two illustrations clearly point out the market risk faced by PDs. This should bring home to them a point that has been stressed by the central bank and through these columns that the commission paid to them is for their own keeping for such rainy days and not for frittering it away.

The annual reports also clearly bring home the point that PDs should seriously look at cost-effective sources of funds. Depending on RBI refinance and call market once again expose them to the market increasing their holding costs for government paper. The recent announcement by the Reserve Bank allowing PDs access to bank finance, commercial paper and inter-corporate deposits will solve their problem to a certain extent. Yet, funding seems to be a major

problem area for PDs. In this context, PDs have been trying to convince the central bank to give them overnight and daylight overdraft but the central bank has in no uncertain terms declined any consideration of this suggestion. Its rationale is that in opting for a settlement system on gross basis, the option of giving daylight overdraft has been automatically closed. In any case, the RBI follows a queuing arrangement in putting through the transactions in the delivery versus payment system. Daylight overdraft is implicit in such an arrangement as the likelihood of bouncing the SGL or current account drawal is reduced a great deal. Having given the refinance facility and the line of credit, the central bank also does not see any need to give PDs any further overdraft facility. Also, in considering such facility for SGL account, the Securities Contract Regulation Act (SCRA) is an impediment. Overdrawing SGL account amounts to short selling which is not permitted under the SCRA. In other words, PDs will have to look for sources of funds other than the RBI's overnight window.

The overoccupation of PDs in repo market last year had also affected their ability to focus attention on developing retail market in government paper. DFHI's turnover in 'repo' transactions constituted Rs 59,529 crore (or 99.1 per cent) out of its total secondary market turnover in government securities of Rs 60,007 crore in 1995-96; similarly, in the case of STCI, Rs 168,403 crore (or 98.9 per cent) out of Rs 170,282 crore constituted 'repo'. While this year, there are no external constraints in the development of a retail market, PDs have been engaged in unnecessary controversies such as, sharing of commission and seeking props from the central bank. In fact, there are tremendous possibilities for the development of secondary market in government securities with the new players such as, provident funds, NBFCs, co-operatives, and RRBs which have been recently asked to keep higher SLR. PDs can also repackage the existing portfolios of insurance companies and large provident funds to turn them more youthful. It would be advisable to use the

(-) means no trading YTM = Yield to maturity in percentage per annum CY = Current yield in per cent per annum * Yield rates of these sub-groups of t-bills and dated securities have been used for the graphs.

Notes: 1) Yields are weighted yields, weighted by the amounts of each transaction.

2) Current yield has not been worked out for treasury bills.

commission in absorbing the losses occurring on account of developing the market in this manner rather than sharing it with existing class of investors and distorting the yield curve for government paper.

Bonds Market

After three prominent corporate houses, namely, TISCO, Larsen and Toubro, and Arvind Mills, were hard put to successfully conclude their bonds/debenture issues, it is surmised that manufacturing firms are not a favoured group in the bonds and other debt instrument markets. On the other hand, with the Indian public becoming increasingly sensitive to risk, the public financial institutions and public sector undertakings (PSUs) continue to attract attention amongst the investors. Even so, despite the stiff competition amongst the public bodies, the medium to long-term rates of interest have hardly come down. During the month, IDBI floated twin issues of 1-year bond at 16 per cent and 3-year bond at 16.5 per cent totalling Rs 250 crore: the issue managed to reach its target. In its open-ended scheme, IDBI could collect Rs 700 crore. Due to pressures for reducing lending rates, it is reported that the IDBI's forthcoming issue of Rs 1,000 crore (with a green shoe option of another Rs 1,000 crore) will carry an interest rate of 15 per cent as against the earlier 16 per cent for similar maturity.

A number of PSUs were active in raising long-term funds from the market by paying hefty interest rates in terms of higher upfront discounts. The forthcoming issues in the PSU segment are SBI (Rs 1,000 crore), Konkan Railways (Rs 150 crore), NHB (Rs 500 crore) and KSIDC (Rs 100 crore).

Commercial Paper (CP)

With the stiffening of lending rates, the corporate interest in CDs had revived in the first half of this year; the outstanding amount steadily rose from Rs 73 crore at the end of April to Rs 350 crore on September 15 and the effective rate of discount fell from a range of 18.1 to 20.3 per cent to 12.8 to 14.1 per cent during the period. The CP market has received a further boost following the latest credit policy of delinking CPs from cash credit limit. The corporates will have the freedom to take the entire maximum permissible bank finance (MPBF) through CP.

Certificates of Deposit (CDs)

The easy liquidity has also resulted in reduced dependence on certificates of deposits by banks and financial institutions as also a fall in its effective rate of interest. CDs issued by banks steadily fell from Rs 21,053 crore as of June 7 to Rs 16,817 crore on August 16 and the effective rate of interest from 12 to 20 per cent to 9.50 to 16 per cent. IDBI raised Rs 30 crore from Punjab & Sind Bank at 16.5 per cent on October 1 but was

willing to offer only 15 per cent by the 10th of the month. The rates came down even further after the monetary policy announcement.

ICD Market

After defaults of some prime borrowers in the inter-corporate deposit (ICD) market a couple of months ago, the sentiment in this market has been extremely cautious. In fact, a list of defaulters being circulated in the ICD market indicated that the largest number of defaulters has been in the textile sector followed by chemicals and food and agro-based industries. Steel, construction and drugs also figured as dominating defaulters.

IV Secondary Market

Dated Securities

Government securities, especially the erstwhile high coupon and short-dated ones, came under mounting speculative demand which was fuelled by the expectation and ultimate realisation of a liberal credit policy, ample liquidity and low call rates. Trading on the NSE screen in government securities during October was twice (Rs 2,696 crore) as much as that during September (Rs 1,383 crore) (see Table 6). Likewise the SGL transactions shot up from Rs 2,458 crore to Rs 4,286 crore. Many banks, mostly foreign, took the early bird position and booked profits after the credit policy when prices perked up. The most sought after security was 13.65 per cent 1999 stock which was swapped with 12.0 per cent 1999 due to the former's better yield. Even when the RBI put the former stock on its sale window on October 22 at a yield of 13.64 per cent, the intense demand pushed up its price by 6 paise the same day and forced the Reserve Bank to ration the scrip. The total amount of stock sold on that single day was Rs 275 crore. The beginning of the month also saw hectic trading in 13.5 per cent 1998 stock as the date for coupon payment, i.e., October 18, drew nearer. The trading of this stock was stopped from October 10 till the coupon date. Another large trading was witnessed in case of ZCB 2,000 when SBI Gilts sold this stock worth Rs 250 crore at yield of 13.73 per cent as a form of commission sharing. The other securities which were in much demand were 13.5 per cent 1997 and 13.82 per cent 2002 (see Appendix Table). The release of over Rs 2,100 crore through CRR cut on October 26 caused over two percentage points drop in the yields on one-year paper from 12.5 per cent to 10.80 per cent, while at the other end of the spectrum, the 10-year paper saw yields dropping by at least 12 basis points. The RBI also played an active role in bringing down the yields with frequent changes in its price list for open market operations.

Open Market Operations

After a gap of almost two years, the RBI has revived its open market operations in October. It absorbed as much as Rs 1,579 crore through this instrument between October 10 and October 31. Of this, a larger portion was absorbed on and after October 22, that is, after the new credit policy. The RBI also used its price list for OMO to send signals to the market on interest rates. It offered long-dated paper at prices much higher than the market indicating the imperative of a southward direction of long-term interest rates. While the market did not hesitate in purchasing long-dated paper, it took the signal on interest rates with a pinch of salt.

Repo Transactions Outside the RBI

With an increase in the number of government paper eligible for repo, the size of the repo market has begun to grow again, the bulk of it being for 3-day durations as overnight funding mechanism without raising the net DTL. Interestingly the rates of interest have ranged from 5.25 to 11 per cent, with a weighted average of only 6.74 per cent per annum. At the other extreme, the 14-day repo, which has enjoyed some importance from chronically deficient banks, has fetched a weighted average rate of 10.45 per cent per annum (Table 7).

Other Debt Instruments

The secondary market in PSU bonds saw some tempo of activity until the announcement of the credit policy but there after it was subdued. Total trade in these bonds on the NSE screen rose from Rs 67.61 crore in September to Rs 97.22 crore in October (Table 6). The secondary market in CPs and CDs continued to remain subdued as the investors refused to part with these papers.

Yield Curve

There have occurred some radical changes in the yield curve behaviour for government paper during October. While the curve for the YTM of 364-day TBs shows a steeply upward movement, that for the dated government securities has remained stubbornly flat suggesting that the term-spreads have considerably narrowed down, particularly after the emergence of excess liquidity conditions in the money market (Graph D). In the normal course, this should have been a precursor to a fall in the long-term interest rates for commercial borrowings and impetus to increased investment activity. But, the financial sector liberalisation combined with large government borrowings has made possible the insulation of financial markets from the needs of the real sectors where, the long-term interest rates may continue to rule high even when long-term interest rates on government paper show a falling trend.

[V P Prasanth and Refiq L. Ansari have rendered considerable help in the preparation of this review.]

The Left Front and the 'Unintended City'

Is a Civilised Transition Possible?

Jai Sen

The recent drive by the Left Front government in West Bengal to phase out hand-rickshaws is a feature of the grand plan to modernise Calcutta in the context of globalisation. Unlike the last time, in the early 1980s, when the Left Front had attempted to abolish hand-rickshaw, there has been little protest from any quarter today.

THE debate that has recently been taking place in Calcutta – within the state government, within the ruling Left Front, and in the media – about the future of 'hand-rickshaws and of rickshaw-pullers in Calcutta, has in many ways been interesting, instructive, and good to see. This is not a new debate, but it has been good to see that this time, there seem to be people in leading positions – such as Buddhadeb Bhattacharya, minister (home) – who, for a while anyway, seemed to be not willing to take a simple-minded approach to traffic planning and 'city modernisation'. They have, on and off at least, seemed to be willing to confront some of the awkward realities that are contained in our social existence, of which rickshaws and rickshaw-pulling (and for that matter, the riding of rickshaws) is only one example. It has been good simply to see ministers talking fairly openly about such issues; and it has also been good to see a new openness within the left, where such issues have been allowed to come out in public (which was not at all there just a decade ago, on the very same subject).

But it is important also to underline the fact that if we want to see ourselves as living in and building a democratic society, this is a very important public debate – one which is of far more significance than might appear to be the case at first sight. As I explain below, in collective terms the debate implicitly involves the lives, livelihoods, and futures of a huge population, straddling urban and rural areas in Bengal, Bihar, Orissa, Uttar Pradesh, and also Bangladesh. This is moreover not only a large population, but also among the poorest and most exploited sections in the region and country. It is crucial also to recognise that the apparent stand-off that briefly appeared in public between Buddhadeb Bhattacharya and Subhas Chakraborty is, to put crudely, between more civilised and democratic planning and more authoritarian ("I will clear them from the streets") planning. The

agenda at hand is thus much bigger than just 'rickshaws or no rickshaws'. Indeed, precisely because rickshaws and their pullers are a powerful symbol and reminder of a feudal past (and of a continuing present that exists too widely in the country), it is vital that the issue is understood not just by itself but as a part of the wider and continuing struggle to fight feudalism. And it is important that the recent debate is sustained and taken up as widely as possible, within parties and in civil society, and that a socially just and forward-looking resolution found; and that apparently 'modern' but equally authoritarian, neo-feudal, 'planning' is not permitted.

At the time of writing, one of the more recent developments in a fast-developing situation, is that the two ministers in question have 'buried the hatchet', and that Bhattacharya has apparently come round to agree with Chakraborty that "rickshaws must be quickly cleared from the city, for the good of the city", and, it has been reported, that he apparently agrees that "the poor must suffer a little for the good of the larger community". There is, perhaps, more between the lines than the media has reported, but nevertheless it has to be said: How familiar and how sad it is to read this – and quite aside from how patently anti-Marxist this refrain is. To this observer, this position is grotesque, especially coming as it does from a government of parties who claim to be of the left. By recalling the history of the present situation and thus placing it in context, and in particular by drawing on the debate that took place in Calcutta in the early 1980s around a precisely similar drive to get rid of rickshaws in the name of modernisation, and by pointing to some concrete and feasible alternatives, this article hopes to re-open the debate, towards a more meaningful process of change.

Though the debate has so far been largely focused on the future of hand-rickshaws in

Calcutta (and only to an extent, on the future of the rickshaw-pullers; there is a vital difference), we must also remind ourselves that in fact the West Bengal government's proposed drive is possibly going to be much wider. In what was perhaps the opening salvo this year, R K Prasanna, transport secretary, announced on August 7 that the state government had decided that "The city will no longer have hand-pulled and cycle-rickshaws, pull carts, school vans and other cycle-vans by the end of this year... The decision to remove all manual modes of transport has been finalised" (*The Telegraph*, August 8, emphasis supplied). So the number of people who stand to lose their livelihoods, and importantly also the range of services lost to the rest of Calcutta, is in fact far larger than simply those involved in the rickshaw trade alone. But as often happens in this debate however, the hand-rickshaw and the rickshaw-puller has come to symbolise this larger world. For the sake of convenience, I too will confine my discussion to this section, but would like it to be seen to symbolise the much larger question – the future of what I call 'the unintended city', the city of the poor. The question before us is: is a civilised, and democratic, transition possible? Is the Left Front, whose constituents have historically associated themselves with the poor, and with the struggle for democracy, willing to address this question?

A drive for the removal of hawkers has also been simultaneously announced – or more accurately, of what Chakraborty has distinguished as 'encroachers' (saying that 'hawkers' are those who move around hawking their wares, and where those commonly called 'hawkers' are usually in fact simple encroachers on public land such as footpaths; *Statesman*, August 18). After much to-ing and fro-ing, CITU – and perhaps some other unions affiliated to the left parties – has come out in defence of the rights of 'poor hawkers' to hawk, but not what it calls 'businessmen' (*The Telegraph*, October 2). It is important to recognise this distinction, and that established hawkers, though also part of what planners and academics like to call the 'informal sector', constitute a very different class and section than rickshaw-pullers. Although in simple physical planning terms, their occupation of public space may seem to be also related to road and traffic congestion, in economic and political terms this is a very different question. It is no accident that elaborate plans such as the commercial development of Vivekananda Park in south Calcutta (*The Telegraph*, September 27 and 28),

ostensibly in the name of 'rehabilitating hawkers who will be removed', have materialised within a month – and where plans for the rehabilitation of rickshaw-pullers are still at the level of conjecture and 'meetings'. It is only too typical of officialdom to club the two questions together – under the bureaucratic rubric of 'law and order', 'traffic congestion', etc. And despite his otherwise useful distinction in relation to hawking, Chakraborty himself also seems quite happy to lump encroachers and rickshaw-pullers together. What is sad to see is that other than Buddhadeb Bhattacharya, no other voice or opinion in the Left Front in West Bengal has been raised to make distinctions and to move towards clearer and more strategic thinking, planning, and action – something that has often been the hallmark of the left.

THE UNINTENDED CITY

Rickshaws and rickshaw-pullers, are just one fragment of what planners, social scientists, and the international bureaucracy tend to call the 'informal sector', but which I prefer to term 'the unintended city': A society that has grown within and beside the intended city and society [Jai Sen 1975]. The existence of this 'city' is neither planned nor intended, either by ruling sections and their planners or, in any collective or deliberate sense, by its own members; but nor is it intended by the richer sections that it should disappear – for it is in their interests that 'the poor' should always be around, to service them with cheap labour. Though the debate in question has been taking place in and about Calcutta, this larger reality is equally true of all cities and towns in the country – and indeed, to greater or lesser extent, of all cities and towns in the world; and only increasingly so, as the contradictions of modern and post-modern development manifest themselves. The increasing number of street children in urban areas of the south, and the increasing homelessness in cities of the north, are just two manifestations.

In our context, the citizens of the unintended city are no different from the middle classes, in that most of them come from the surrounding regional hinterland of the city, but the twin forces of rejection and affinity – rejection in the form of discrimination, exclusion, and exploitation by the urban centre, and the affinity of strong ancestral tradition and of familiar primordial association such as language and caste – leads these citizens to live a reality that straddles what are called 'urban' and 'rural' areas. This has led (and is constantly continuing to lead) to the gradual and mostly unintended evolution of a 'new' society, different from either the conventionally or normatively 'rural' or 'urban', a synthesis of

the ordinary things that this mass of ordinary people is doing over generations in their myriad struggles to survive and to prosper in a relentlessly hostile environment. This hybrid society has specific and inherent value especially for the poor, since it allows them to develop within their own capacities and potentialities, to meet the demands of evolving life both in the city and in their rural homes; and as a result, new hybrid values are slowly being evolved which offer them flexibility and security, both of which are vital in an evolving situation.

So far in history, there has been little or no genuine attempt on the part of dominant society to accept the urban poor and disadvantaged as a part of the city, here or anywhere else: To accept them as equal and integral citizens, to develop the city also according to their needs as a society different from the 'dominant urban', and where their disadvantage might be reduced; and to find ways of planning and decision-making in which they can take equal part. At best, they are tolerated, and planning is done for them, according to what the dominant centre thinks is best for them. Usually, it is quite the opposite, where 'planning' means what the dominant centre thinks is best for itself, and where such peoples are not only exploited for their labour but their lifestyles are also frowned upon and their livelihoods declared illegal – and then even this 'illegality' is then exploited. In those rare instances where things have been different and where change has taken place, it has usually come about as a result of resistance and struggle – not out of largesse.

Rickshaws and rickshaw-pulling are a classic case in point. By the early 1980s, there were some 50-60,000 hand-rickshaws being plied in Calcutta, but the number of licences that were issued by the Calcutta Municipal Corporation (and the ceiling on licences, under existing law) was only 6,000. This ceiling remains the case, even today. A certain number of licences were also issued at that time by surrounding municipalities such as Rajpur, but this still left something like 40,000 rickshaws which were in use at that time, that were 'unlicensed'. Since each vehicle provided employment to an average 2.2 pullers per day, this meant that nearly a lakh of pullers were then being forced to work 'illegally'.

The research which produced these figures, done by Unnayan, a civil organisation based in Calcutta, also however revealed an interesting background: (a) The ceiling on licences of 6,000 had been set as far back as 1939, 57 years ago now. This figure has not been revised upwards since then, despite the tremendous growth in the city's population and the inevitable consequent tremendous increase in demand for services; despite official reports recommending increases;

and, no less important, despite the evident reality of a huge number of 'unlicensed' vehicles – which were nearly 90 per cent of the total on the streets, by the early 1980s. (b) This situation was far from being one of benign neglect. The standard and mandatory rule for all 'unlicensed' rickshaws and their equally unlicensed pullers, was (and remains) regular bribes to both corporation officials and the police, adding up to a dirty grey economy running into crores [tens of millions] of rupees, each year. And (c) Large numbers of these unlicensed vehicles were in fact owned by members of the police force [Unnayan and Thomas 1981]. In this situation, it is only quite likely that many of these 'unlicensed' vehicles on the streets were ones that had earlier been seized by the police, on the grounds of illegality, and were then being 'recycled'. So it was a neatly tied-up economy, where the pullers were exploited by both the owners of the vehicles and by the administrators of the city.

Point (c) is not to suggest that it is only policemen who own fleets of rickshaws. Unnayan's research showed that the majority of rickshaws, both licensed and unlicensed but especially the unlicensed, were owned in small and medium fleets (of between two and 20 vehicles) by individual owners, i.e., by 'small owners'; and there were only a few 'large owners', having fleets of hundreds of vehicles. Unlike the cycle-rickshaw trade, where this was at least partly the case, very few hand-rickshaw-pullers owned the vehicles they pulled, let alone fleets. In short, it was a highly exploitative and feudal trade right up to the early 1980s. The now-famous book and film 'City of Joy' (which, incidentally there is much reason to believe, took a lot from the Unnayan study without acknowledging it) portrayed a part of this feudal reality.

There is little to suggest that this situation has changed much since the early 1980s – except in the important dimension of numbers, where both the number of vehicles and pullers has gone substantially down. This reduction has taken place not 'by itself' but on account of a combination of factors since then. On the one hand, there has been a fairly sustained – if also sporadic – process of seizures of unlicensed vehicles by the police, and an apparently much stricter process of issuing of licences by the corporation, both for vehicles and pullers. On the other hand, the steep rise in the cost of living over this period that the pullers have equally faced, as well as the constantly-rising level of pay-off that has had to be made to the police precisely because of the dropping numbers of vehicles, has meant that rickshaw fares have risen very sharply during this time – and that their usage has accordingly dropped. It is a war of attrition,

with a certain inevitability about it; the government's move suggests that it is finding the process too slow, and seems to be to accelerate it.

ARE THERE ANY LESSONS?

The currently-proposed 'drive for modernisation', and in some ways the debate that has been taking place, is also nothing new. The last major round that took place, was in the early 1980s, when the same Left Front government put into practice a major drive to ban 'unlicensed' rickshaws from the city – and, simultaneously, to introduce auto-rickshaws. Much publicity was given to constables being given special rewards for seizing unlicensed rickshaws; long lines of chained vehicles started appearing in front of the city's police stations, followed by huge stockpiles of their broken carcasses in dumps in the north and south of the city. Unlike this time round, when there has been so little opposition except for a few letters in the papers (and Bihar politicians Laloo Prasad Yadav and George Fernandes speaking out in support of Bihari pullers), the 1981 drive was opposed and strongly criticised by different sections of civil society in the city, and briefly also by the Congress Party. The criticism however perhaps especially came from Unnayan, which entirely by coincidence had at that time just completed and published its detailed study of the hand- and cycle-rickshaw trades in the city, as outlined above. Unnayan found the plan to ban to be outrageous, violating the most fundamental of the pullers' human rights and also making no planning sense at all. On the basis of its findings, it argued that the banning of so-called 'unlicensed' rickshaws in the city would on the one hand suddenly deprive the city of a range of important services (short-distance passenger travel, freight carriage in dense inner-city areas, as well as speciality services such as emergency transport for the aged and the ill especially among the majority of the city that is low-income, and safe personalised service for school children). On the other hand, since no employment alternatives were proposed for the pullers, the drive would throw nearly a lakh of pullers out of work, as well as a significant further number who were employed in rickshaw assembly and servicing work.

On that occasion however, there was no public opposition or debate within the Left Front (at least, which came out in the public). It is in fact one of the tragedies and contradictions of the left being in power in Bengal that the drive was, for instance, not opposed by the Calcutta Rickshaw Pullers Union, formed by the legendary unionist Mohammed Ali. This union had been built among the highly unorganised pullers during the 1950s, when workers in this highly feudal

trade came to be 'organised' for the first time and to command some respect from the bureaucracy as well as from owners of the vehicles. But in the 1980s, when Unnayan approached it for its views on the drive being undertaken, it found the union to be paralysed on the question, seemingly on account of its being tied to one of the ruling parties. Finding no constructive response to its arguments from within unions and from within the left (and indeed, from one of the state's civil liberty organisations, who decided that the matter was 'a trade union matter, not a question of human rights' – a sign of those times). Unnayan took its points to the public. Through booklets, newspaper articles, and with the help of an arresting film called 'Man vs Man' made by film-maker Shashi Anand based on its study, Unnayan was able to raise a fair debate in the city – indeed, to such an extent that the chief minister himself came out in public and said darkly that 'some people are misleading the public' on the issue.

Unnayan's campaign was however by no means decisive. It was only when Unnayan's campaign came to notice of trade unionist George Fernandes, and the question was taken up by him – in part because a substantial proportion of the city's pullers are from Muzaffarpur in Bihar, which was then his constituency – that the Calcutta Rickshaw Chalak Panchayat was formed. And it was only after the matter was taken by the new union to mass meetings of rickshaw-pullers, in Mohammed Ali Park in central Calcutta among other places, leading to gheraos of police stations and the corporation's licensing office, that the 1981 drive died down.

On its part, Unnayan went further than merely opposing the drive. If proposed that while the feudal practice and trade of rickshaw pulling should certainly be done away with, mandatory policy prerequisites had to be (i) the making available of alternative employment opportunities for the pullers, and (ii) the replacement of the most essential services that would be lost. To achieve this most economically, Unnayan proposed the mass introduction of what it called a 'city-rickshaw' and also, for what would have been the first time, transport and traffic planning in the city that took such transport services into account, such as route separation.

The city rickshaw was not simply a fanciful idea. With the help of volunteer designers and engineers, Unnayan took the initiative of designing such a vehicle and of building and testing a couple of prototypes, including making it available to a rickshaw drivers' co-operative in Kasba for field testing, where it proved very popular. Basically a cycle-rickshaw and just as easily buildable, the cycle-rickshaw was however a radical

improvement. Smaller and with a tighter turning circle (essential for dense inner-city traffic), lower and therefore far more stable, equipped with gears and drum-brakes for easier driving, and fitted with independent suspension for a far more comfortable ride for passengers, the city-rickshaw could have been a very appropriate replacement for the hand-rickshaw on both the policy counts listed above. The prototypes designed and tested could also be easily converted into an effective freight-carrying vehicle, which is an equally essential characteristic of a vehicle in our context.

The government of West Bengal was however, not interested. Though many individuals within government departments expressed much interest, including in the state planning board and the small industries department, none of the government bodies that Unnayan approached were willing to even provide the small grant that it requested for the research and development work that had to be done to make the idea a reality, let alone look at the idea. To the contrary, in a previously unannounced step but one which must have had a lot of pre-planning, the state government suddenly announced the introduction – and licensing – of auto-rickshaws in the city, even while the hand-rickshaw drive was on. Indicating that Unnayan's campaign had at least had some effect, the chief minister went so far as to say in public that "the public should not be worried about the loss of services caused by the banning of hand-rickshaws; the government is introducing auto-rickshaws, and they will carry your kiddies to school".

The dangerous and polluted history of auto-rickshaw service in the city over the subsequent years has shown how ironic and weak that claim was, but far more significant are the facts that the chief minister failed completely at that time to address the question of his government throwing the poorest of toilers out of work and thereby being directly responsible for creating only more misery and more unemployment. Instead, the situation was used by the government to invite Bajaj, the industrialist-manufacturers of auto-rickshaws, to move into the city and displace the small assemblers who made hand-rickshaws. And even as thousands of impoverished rickshaw-pullers were put out of work, the situation was used by the government as an opportunity to give heavily subsidised employment to an entirely different section: hundreds of 'educated-unemployed youth', almost certainly a convenient vote-bank, were given auto-rickshaws worth Rs 25-30,000 each in the name of bank loans that in effect never had to be repaid – against the cost of a hand-rickshaw of Rs 1,000. The bank loans were later written off. It is also not possible to

This important volume contributes substantively to the current debate on the role of gender studies in the overall context of the development of Indian sociology. It brings together a wide range of perspectives from sociologists, social anthropologists, historians and scholars of the legal system who reflect on the processes of policy formation, legislation, and dispute adjudication as they apply to the intersection of social reform, sexuality, gender and the state.

Finance Faculty

Required for

XLRI Jamshedpur

An institute that believes in Managerial Excellence

If you have done Ph.D./ Fellow Programme or relevant industrial experience, send your resume to:

Director

XLRI, C. H. Area (E), Jamshedpur - 831 001

Phone: (0657) 431 - 173/363/396/, 425233, 428045

Fax: 91-657-427814

Your resume should include - Date of Birth, Qualifications, Experience, Research Projects, Publications, etc.

PS. Faculty in other areas of managerial functions are also required.

avoid the fact that those who were subsidised in 1982-84 were Bengali, and those who were rendered unemployed were largely non-Bengali. This communal reality was only reflected in the response of the then state minister of transport, when Unnayan approached him in 1981 about the problems being created by the drive. "But the rickshaw-pullers are only Biharis! And after all, the government is only seizing rickshaws in order to protect law and order."

The situation that exists in Calcutta today, in 1996, is not very different. There are, however, two important exceptions. One is that for a brief while so far at least, someone important within the government has spoken up and has even spoken about the contribution of the pullers to the city. For the moment, this voice however also seems to have died down. Since there were no other changes in the situation, this has happened for reasons that are not very clear – except that the government wanted to present a unified face to the public, at any cost. What this article has tried to show is that it is of considerable importance – for a civilised society, and for the left – that this voice be raised once again, and that it is supported loudly and clearly by civil society and by all democratic-minded political parties. The Congress Party would in fact do well to recall that one of the first points in its 1994 election manifesto was 'Replace hand-pulled rickshaws by driver-owned cycle-rickshaws... In the first 100 days' (*Pioneer*, March 27, 1994). The history of this point is not known.

The second exception, or change since the 1980s, is that following the first skirmish and then the peace treaty, and contrary to his earlier defiant stand of 'No Rickshaws' Chakraborty has announced that the state government has 'begun discussions with two automobile companies, Bajaj Auto and Telco, to design and manufacture a smaller and simpler version of the auto-rickshaw, which can be handed over to the rickshaw- and handcart-pullers as an alternative mode of employment' (*The Telegraph*, September 24). Taken at face value, this should also be accepted as an advance since the 1980s. But closer examination of what Chakraborty also said reveals that the government will also be holding "a meeting with representatives of nationalised banks and state co-operative banks...very soon", and that "A formula will be chalked out to make money available (*sic*) to rickshaw- and handcart-pullers or any other interested unemployed person, he said" (*The Telegraph*, September 24, 1996, emphasis supplied). Aside from severe other problems with this proposal, this is the crunch line: The process of supposedly giving employment alternatives to 'the poor pullers' is evidently being once again used as an entry door for 'other interested persons'. History is only repeating itself.

SOME CONCLUSIONS

It is also important to realise that the anti-rickshaw drive now being given shape, has not suddenly materialised. There are clearly people, and sections, within government who are determined to remove rickshaws, whatever it takes. Exactly one year ago, *The Guardian* in Britain carried an article headlined 'End of the road for rickshaws: Plans to modernise Calcutta will rob 60,000 human engines of their jobs'. The article quoted Ashim Burman, commissioner of the Calcutta Municipal Corporation (who was credited as "shaking things up since taking over last year as Calcutta's city commissioner") as saying: "Man pulled rickshaws have to be dispensed with. They add to congestion, and they are humiliating" (October 5, 1995). The article also pointed out that "Burman is part of a wider effort to reinvigorate Calcutta... The Communist politicians who control the West Bengal state government and its capital Calcutta have begun to turn their backs on Marxist orthodoxy... Travelling widely in an effort to attract foreign investment, they have vowed that Calcutta will one day outpace Bombay." This part of the grand plan has thus taken 10 months to mature.

There was no mention of alternatives for the pullers in this October 1995 article in *The Guardian*, just as it was not there in the state government's attempt in 1982-84 to ban rickshaws. That this question is now in the air, thus needs to be considered as at least some advance, as does the forthright position that Bhattacharya has taken – at one point – on the contribution that rickshaw-pullers make to the city. If the criticism is that men pulling other human beings is inhuman, and that the overall objective is to humanise society, then the question to be asked is: How can this be done? Can the humanisation of society really be done by executive fiat from above, or does it not require that the pullers themselves are a part of the process? That they must be involved, and that whatever education it requires to achieve this, must necessarily be a part of this? In formal terms, the left has historically always emphasised the necessity of the emancipation of the oppressed, and the successes of many of the campaigns and struggles it has been involved with before and after independence, has come from this strength. But where does the Left Front government in West Bengal stand on this question, in this present case?

Secondly, it is also very important that the public does not allow itself to be hoodwinked and that in the name of providing employment alternatives to 'handrickshaw-pullers and to other interested sections', that what happens is that vehicles are once again introduced, just as in 1983, which in fact all go to

strategically-placed 'other sections' who would never have stooped to do something manual like pulling a rickshaw. The state government should be asked to categorically limit benefits of this scheme only to those who were previously rickshaw- or handcart-pullers, and to none else. If the scheme is not workable with these people, then the scheme should be closed – not simply transferred to another group of people. And the government should also be asked to keep in mind: If its scheme does not work, then how will the services lost be replaced, and what other alternatives is it offering to the disemployed pullers?

Thirdly, while it is good to see that the government is this time talking of technological alternatives to the hand-rickshaw, and that the cost of the alternatives is one of the considerations, there is much reason to think that an engine-driven, 'cheaper auto-rickshaw' is neither feasible nor the required answer to the situation; and that some variation of the idea of a human-driven 'city-rickshaw' proposed by Unnayan back in 1984 still deserves a serious consideration. An engine-driven vehicle, especially if made by the likes of industries such as Bajaj and Telco, is extremely unlikely to be available at a cost that the existing hand-rickshaw pullers – and not other unemployed sections – can afford to buy and repay the loan on. On top of this, in an already dangerously polluted city such as Calcutta, it is essential to keep in mind that more engine-powered vehicles on the streets will only add heavily to both noise and air pollution. A human-driven machine can, if properly organised as a scheme, overcome most of these disadvantages. And a machine such as the one proposed by Unnayan is no less dignified than an engine-driven machine.

Fourthly, any such plan has two basic and interrelated requirements. First, it requires that detailed re-thinking be done in terms of traffic and transport planning of the city. This re-thinking must take into account both the kind of real transport needs that the different classes and sections of the city require, in the widely-varying localities that exist (from dense central and north Calcutta, to the more suburban areas), as well as the amount and kinds of road-space that is available and also the local availability of human labour power. Some amount of future planning, attempting to predict requirements and availabilities in the future, is also required. It also needs to be recognised that there is conflict between slow and fast-moving vehicles – but equally, it needs to be recognised that the resolution of this is by no means that slow-moving vehicles should be removed. In some areas, and on some roads, it is the movement of faster-moving vehicles which should be restricted. Zone and route separation (of

fast- and slow-moving vehicles) are possible, and should be tried on an experimental basis in different areas until the right balance is achieved. If it can work in other cities in the world, there is no reason why it should not work in Calcutta. It is a question only of there being available the necessary political vision and political will.

The second requirement is that there is a need to think beyond the level of planning 'for' the people, and to move to planning with them. The meetings that have been taking place with 'non-governmental organisations' of the intelligentsia is better than no meetings at all, but the government needs to move beyond limiting its vision to only the middle-classes – and to directly involve those who are bearing the brunt of the changes it is proposing: the labouring classes, the citizens of the unintended city. Recognising this so-far unintended unrecognised world, involving its members in the planning of their own futures and more generally the city, would constitute one of the most powerful and meaningful ways to change the present situation, and is a prerequisite for a civilised transition from where we are today. Even if the sleight of hand that seems planned can be blocked, simply to legislate out the livelihoods and existence of some people, and to legislate in favour of others, is – though it may have the outward appearance of change and modernisation – no change from a backward past.

Finally, Calcutta has a very special responsibility in this field. It is almost certainly the very last city in the world, and in history, to have hand-rickshaws. Despite the inhumanity of man pulling man, and despite the feudality of the trade, the 'jin rikisha' (man-pulled vehicle in Japanese – it was arguably first introduced there, in about 1869) has played a memorable role in the history and culture of humankind. The struggle of rickshaw-pullers, perhaps precisely because of the mesmerising reminder that it offers of the real nature of human relations in society, has figured widely in the literature of possibly all Asian cultures, certainly in all parts of India. The rickshaw, indeed, has only operated in Asia – in colonial Asia. It was introduced, it proliferated, and it operated as reflection of a time and of societies where humans became cheaper to use as beasts of burden than animals. We are now, thankfully, moving past those times. In almost all other contexts, including within India, the rickshaw – and the rickshaw-puller – was simply driven out, crushed out of existence which, as I argue above, is just as authoritarian as the societies from which they emerged. In this situation, Calcutta needs to do two things: one, and beyond doubt first of all, it needs to phase out its

own part in this past in as meaningful and graceful fashion as possible – and equally, to phase in the future in a civilised and democratic way. And two, and especially given its penchant for the unusual, Calcutta should seriously consider establishing – and taking some liberty with the original language – a 'Museum of the Rikisha Jin and the Jin Rikisha' as a testament to the

struggle of the rickshaw-pullers of Asia, both in the past and the future.

End of a Social Revolution?

Amaresh Misra

The Uttar Pradesh assembly elections will be remembered for the decisive turning away of the SP and the BSP from the anti-upper caste, dalit-backward-Muslim agenda to an old, Congress-type status quoist social equation.

IT has been days since an unprecedented 'president's rule' was imposed in UP after a hung assembly verdict failed to throw up a working government. And yet, no solution to the impasse is at hand. With incidents like Kanshi Ram's fracas with scribes in Delhi, the situation, if anything, is getting more complicated with each passing moment. In fact, the continuing deadlock in UP is raising fears about this politically crucial state of the Indian union sliding into a sustained phase of instability.

The grimness of the situation can be gauged by the fact that it confounded several political predictions – prior to the elections, Mulayam Singh was in a vulnerable position while the BSP was riding high. After the results, Mulayam Singh, with 112 seats for the SP, and the UF, with 134 seats and 30 per cent vote, in the second position, has emerged strong enough to refuse co-operation with the BSP. The latter though polling a good number of 29 per cent votes in alliance with the Congress and winning 100 (BSP-67, Congress-33) seats is caught in a bind where its very advantage of using both the BJP and the UF in case of hung assembly has turned against it. The BJP, humbled from an expected majority to 175 seats (32 per cent vote), is caught between the choice of supporting the BSP or offering a vague and facetious promise of winning the confidence vote if given a chance. Even if the present stalemate is resolved and any of the two parties manage to cobble together a coalition government, it is likely to fall soon paving the way for another possible round of president's rule and fresh elections.

At one level, what makes UP, and its instability, different from other states is the existence of three political formations competing for power. This in itself is a unique situation considering that in other provinces, two parties or social forces have normally contended for the control of the state capital. In UP, it was always the Congress versus the rest of the opposition, led in varying degrees by Ram Manohar Lohia, Charan Singh and Mulayam Singh Yadav. The picture was altered with the rise of an 'independent' dalit party in the mid-1980s – a phenomenon without precedence in any

other region. This altered the traditional fight between the upper castes and the emerging backward castes from the 1960s onwards.

The rise of dalits proceeded, at first, under the leadership of the backwards, particularly during the Mandal phase of the late 1980s and the early 1990s. But after the break-up of the SP-BSP alliance in 1995 and with BSP polling equal number of votes as the SP in the 1996 parliamentary elections, dalit political assertion was a distinct phenomenon in its own right. But, even then, it could have aligned with the SP which at the social level would have meant an alliance of the backwards, dalits and the Muslims as a new power group formation, capable of filling the vacuum formed by the retreat of the social base of the Congress comprised of brahmins, Muslims and dalits which had provided stability to UP in the past.

The great mystery of UP, which has deepened since the fractured mandate of assembly polls and the inability of the SP and the BSP to get together even for keeping the BJP out, is the failure of this new possibility to materialise. What exactly is stopping the Muslims, the backwards and the dalits to combine? Surely, the individual ambitions and the short-sightedness of leaders like Mulayam Singh and Kanshi Ram, or the political calculations of the UF government at the centre, though important, cannot be counted as ultimate, decisive factors.

Actually there is more to a dalit-Muslim-backward combine than meets the eye – somewhere, deep down, it requires a shake-up of the status quo, more in the nature of a 'class' than a 'caste' struggle. It would mean a cultural shift from centuries of upper caste hegemony and changes in patterns of land and agricultural resources. The tirades against Manuwaad and communalism at the time of the elections were all right. But neither the BSP nor the SP exhibited any vision to go beyond and articulate an alternative agenda to the Congress based on the interests of the class-caste forces they represent. On the contrary, the BSP preferred to fight the elections in alliance with the Congress. It also toned down its anti-Manuwaadi rhetoric and went out of its way to encourage the Congress in fielding brahmin candidates, and giving

its own elephant symbol to a number of notorious thakur candidates. While doing so its leaders were not cobbling together a dalit-Muslim-backward combination but the old Congress equation under their own leadership.

Similarly, Mulayam Singh did not seem much interested in a Mandal-dalit unity. His main concern was reviving the old AJGAR equation with a fair sprinkling of the upper castes. This time around 17 thakurs romped home on the SP ticket, not only in Rohilkhand but in east UP as well. The behaviour of these parties shows that their attempt was more to replace the Congress than to find an alternative to it – in effect to present themselves as the 'new' ruling class party or alliance of the 'old' type, bearing no departure from the traditional status quo.

Interestingly, the BJP too was attempting the same thing. Behind the rhetoric of Hindutva and clean government lay not a desire to effect a change of regime but to form a 'conservative Congress' with forwards and the backwards. All the three parties were attempting, more or less, the same thing, albeit under the leadership of different power groups – the BJP trying to bring the backwards, especially the most backward castes (MBCs), the kurmis and the lodhs, closer to the upper castes, the BSP trying to bring the MBCs and the Muslims closer to the dalits, and Mulayam Singh attempting to bring the jats and the forwards closer to yadavs and the Muslims. There was thus a consequent shift in the power base of each party – the upper castes remained solidly with the BJP polling as high as 70 per cent. But the brahmins did shift towards the Congress in a number of constituencies making for a slight improvement in the party's performance. The dalits were with the BSP but the Muslims remained with the SP, and the MBCs polled as much as 54 per cent for the BJP. The yadavs did not flinch from the SP but the jat vote remained divided in west UP giving the BJP 47 and the UF 33 seats, with BSP winning 13. The upper caste vote in Uttarakhand was also not forthcoming to the UF – it got only one out of 18 seats of the region, the rest going to the BJP.

But more crucial is the defeat of all the major parties in their strongholds. The BJP could retain only 70, the SP 51 and the BSP 30 of their seats held in the last assembly elections. The BJP had done well in east UP during the parliamentary elections but the SP edged past it this time. The figures given for east UP on Doordarshan were faulty for they included part of Avadh in their projections. They showed the BJP tally at 59, the UF at 55, the BSP at 36 and the Congress at eight. But if the real east UP, non-Avadhian, non-Allahabad districts (Jaunpur, Azamgarh, Varanasi, Ballia, Ghazipur, Mirzapur, Sonbhadra, Gorakhpur, Deoria, Basti) are taken, the BJP's losses are much higher.

In Rohilkhand, where the BJP won 21, and the SP and the BSP 16 and 10 seats, respectively, and where the SP was expected to do better on account of previous parliamentary performance, it was the other way around. In Allahabad, from where the BSP had won nine out of 14 seats, the party's tally was brought down to three. But in other districts of the Lower Doab, Kanpur and Fatehpur, former strongholds of V P Singh where the Janata Dal and prime minister Deve Gowda had pitched up their stakes, it was the BSP which did well. The party also competed with the SP in giving a tough fight to the BJP in the saffron strongholds of central UP and Avadh. In Bundelkhand too, the BSP won 10 seats, pipping past the BJP (7) and the UF (3).

These shifts denote that while the overall pattern of caste voting is the same, a great amount of instability exists at the grass roots level within the base forces of these formations. Yadavs, brahmins and dalits are voting for their parties but they may not be the same yadavs, brahmins who did so the last time. Moreover, all the major parties are standing with one or two bloc forces and then trying to win a third from the other party. Stability could have been expected if there was a stable polarisation between two forces leading to a movement away from the 'third' force to the two main ones. But in UP, the top level competition for the ruling space had become intertwined with intense conflict of social forces and their power groups, and the assertion of the lower orders. It is this, clearly 'class ridden' situation which is giving rise to the dilemma of the BSP – a party whose aim is to forge an alliance of the MBCs, dalits and the Muslims but whose compulsion is to ally with the Congress in order to stay in the race of power. The UF is pitching itself as an alternative to the BJP and the Congress. And yet dalits do not figure in its scheme as it would alienate its principal constituency. In these elections, Mulayam Singh did emerge as the principal anti-BJP, anti-Congress force enjoying the confidence of the secular intelligentsia. But the former chief minister has been able to only regain his lost position and is far from gaining his previous popularity. Within the BJP too, the forward-backward, mandir-non-mandir struggle is making things difficult for a stable policy on issues to evolve. Just before the elections, there were speculations in a section of the press about attempts to wean away Kalyan Singh from the BJP by offering chief ministership. Even now, nothing can be ruled out – the coming days may see break-up of parties. The top level politicking will ultimately see the marginalisation of either the BSP or the SP, the emergence of any one stable pole against the BJP or, even, the revival of the Congress. The UF seems to have lost clout after the imposition of the

president's rule which theoretically favours the BJP. The BSP too is expected to gain since both the BJP and the UF can be accused of stalling the installation of a dalit chief minister. But the BJP has reached a kind of exhaustion point where it would require more than a negative wave against any one party to romp home with a majority. The BSP too, has been pushed into a groove from which to extract itself would need something more than old slogans and rhetoric.

There is also a possibility of the instability producing currents favouring the extension of authoritarian measures like the president's rule or other draconian laws. This situation can also lead to change of political equations at the centre – the deadlock may prompt the Congress, now under a new leadership, to reach for a showdown with the UF. The set back suffered by the BJP explodes the myth of the party representing the psyche of UP or any such misplaced generalisations. It also shows that the party is vulnerable at the ground level, where it is facing a real 'class' challenge both from new ruling power groups and the lower sections. There are no sure gains, as of now, in a revival of the mandir card and it can only gain from the weaknesses

of the centrist parties. As regards the SP and the BSP, the current elections will be remembered for their decisive turning away from the anti-upper caste, dalit-backward-Muslim agenda irrespective of their public postures or future course of actions. They mark another phase in the beginning of the end of the social revolution in UP which had appeared so promising only a few years ago.

With this, a new space opens for new forces, especially those interested in forging a backward-Muslim-dalit unity on an anti-status quoist plank. Though the Left, despite the involvement of Harkishen Singh Surjeet in the affairs of UP, is still of little importance, it was not entirely written off in the elections. The CPM won four and the CPI one seat, through the support of the SP, which was creditable. The CPI(ML) also was able to increase its votes – it was for the first time that the party emerged as a force to reckon with in some constituencies of east UP with a discernible mass base. It was also prominent in political discussions especially in view of its announcement that the Left ought to come forward to fulfil the historic demand of an alternative based on basic issues and the assertion of dalits, backwards and Muslims.

Bargi Dam: Oustees Pay Price of Development

Dilip D'Souza
Mahesh Gavaskar
Suresh Rajeshwar

Oustees from the Bargi dam area were brutally assaulted by the police on August 18 when they refused to allow the reservoir wall to be built to the height decided upon by the Madhya Pradesh government.

ON the morning of August 18 a police force of more than 100 constables (including seven lady constables) and 10 to 15 police officials, led by the collector and the superintendent of police (SP) of Sconi district, landed in Bijasen. A satyagraha had been going on in Bijasen, a remote village on the banks of Narmada in Madhya Pradesh, since July 21. The satyagrahis, numbering more than 500, were among the thousands displaced by the Bargi dam. They were demanding proper rehabilitation threatening to drown themselves if the water level in the Bargi reservoir exceeded 418 metres. It may be recalled that the government of Madhya Pradesh (GoMP) which planned 105 megawatt electricity generation and 4.44 lakh hectare irrigation from the dam, prepared no comprehensive rehabilitation scheme for thousands of dalit, adivasi, artisan and fisherfolk families affected by the very dam. Deprived of their

sources of livelihood and paid measly monetary compensation, the displaced families were forced to eek out their livelihood by toiling as agricultural and manual labourers in adjacent districts. Organised protests by the dam-affected people for complete rehabilitation since 1991 forced the GoMP to constitute a committee on June 13, 1995 under the chairmanship of B D Sharma, to study the issues and recommend rehabilitation measures. But because of administrative delays, financial difficulties and differences of opinion on normative grounds, the committee was not able to put together any concrete measures for rehabilitation.*

The satyagrahis constructed two huts on the river bank at 418 metres in Bijasen. The collector, Sanjay Bandhopadhyay, and the SP, Sanjay Jha, made occasional visits since July 21 to dissuade the satyagrahis from their

determination to drown-themselves. But as the water level started to rise since August 16, and their last ditch effort on August 17 to persuade the satyagrahis to withdraw their agitation failed, the collector and the SP arrived on August 18 with a sizeable contingent of police for a final showdown.

The police cordoned off the village. The SP declared the satyagraha an unlawful assembly. His force arrested Rajkumar Sinha, Asit Kumar and 13 other satyagrahis (including three women). When the satyagrahis began to resist the arrests of their leaders, the police used force to drive away the satyagrahis. Tulsibai and Manglubai received lathi blows on their stomach, buttocks and wrist, while Rajkumaribai, one of the arrested, received a deep lathi wound on the upper part of her thigh. Pandemonium also broke out in the huts. The 500 assembled satyagrahis, including 80-90 women, began running helter-skelter. The satyagrahis allege that the police resorted to lathi charge. A few were even hit by rifle butts on their elbows and forearms. The police pushed lathis between legs of some women, lifting them and throwing them some distance away. Manojkumar Thakur, a 12-year old boy, sustained an ugly wound on the left cheek from a lathi blow. 60-year old Achhelal had his wrist broken while 70-year old Janinabai got a wound on the elbow, when the police delivered her a lathi blow while she was sitting in the hut. The police chased the fleeing villagers right into the village, pelting stones at them. After making the arrests the police party dismantled one of the huts and seized a number of items.

Clear evidence of police brutality is available in the account of Sher Singh and Sakar Singh. Both were coming from Kudwari village to join the satyagraha in the afternoon when they came to know about the police action at Bijasen. They also came to know what befell Manojkumar Thakur who is Sher Singh's nephew. On reaching Bijasen, the village kotwal told them to meet the collector. But on approaching the collector, the police beat them ruthlessly. Sher Singh lost consciousness and regained it only after reaching Lehri Kol. Both were kept without food for 36 hours. On August 19, they were taken to the Indian Red Cross hospital in Seoni for X-rays. Both were made to pay for the X-rays but whose report was not made available to them. On August 20, the two men were produced before the judicial magistrate, and it was then that Rajkumar Sinha spotted them and their story came to light.

GOVERNMENT'S OMISSION

The collector and the SP categorically denied having ordered a lathi charge on August 18. In fact, the collector was of the

opinion that the agitationists had deliberately chosen the inaccessible village of Bijasen in order "to harass the government machinery". Though the SP admitted that the villagers had "legitimate" and "genuine" grievances, the collector, beyond admitting that the area is poor and tribal, seemed hardly sympathetic to the plight of the villagers. His alternatives that the GoMP would guarantee wage labour to the dam-affected people by initiating a scheme similar to the Maharashtra's EGS, and would allow the villagers till the land in the affected area after the water level recedes below 418 metres in the rabi season, appeared to be mockery of the long struggles the villagers have been waging for adequate resettlement. This nonchalant attitude of the top-level government officials is nothing new. R C Dubey, the ex-commissioner of the Jabalpur division, in a report submitted by him to the GoMP in 1987 remarks:

What really appears sad about the project is the situation of the proverbial cart having been placed before the horse. Any such project requires meticulous planning and careful implementation, involving complete and accurate information on all the important variables to be dealt with - cultural, environmental, economic and the rest of them. A plan for the resettlement of the persons to be displaced should be ready before the work starts on the project. In the instant case, the dam is more or less complete and is expected to attain full reservoir level this year but the plan for resettlement is being thought of now... [R C Dubey, *A Plan for Roof: Bargi Dam Project in Seoni, Mandla, Jabalpur Districts*].

These comments show that the negligence of rehabilitation measures has been the characteristic of government's *modus operandi* right since the beginning of the construction of dam.

The GoMP conducted three sample surveys for the resettlement of the oustees. The first survey conducted by the project officers in 1979 maintained that 7,735 families (i.e., population of 27,000) would be affected by

the dam, of which only 25 per cent (i.e., 1,935 families) would require the government's assistance. How these figures were reached is still an enigma. The next survey conducted in 1982 led to the preparation of resettlement plan for the oustees in 1983. This plan made a provision of Rs 226 lakh for the construction of 14 model villages on the basis of facilities and provisions stipulated in the Narmada Tribunal Award. This plan never saw the light of the day. Yet another survey was conducted in January 1986 covering 81 villages. But as R C Dubey mentions in his report, "The project authorities do not seem to have undertaken a comprehensive survey of the affected villages to ascertain the sectionwise and districtwise number of affected households and population" (*A Plan for Roof*, p 17). That the rehabilitation of the oustees of the Bargi dam occupies lower-most priority for the GoMP can be gauged from the fact that out of Rs 412 crore spent on the dam, only Rs 16.98 lakh (0.04 per cent) have been spent - and that too, on an ad hoc basis - on the rehabilitation of the uprooted people.

The indifferent attitude of the GoMP continues. Neither Harbans Singh nor Urmila Singh, both MLAs from the region and members of Digvijay Singh's cabinet, deemed it necessary to look into the episode of August 18. The dam now generates hardly 40 megawatts of electricity and does not even irrigate 20 per cent of the land that it was supposed to. But, the once-prosperous cultivators of Bargi, Bijasen, Gopitola, Kudwari villages slog as rickshawpullers, construction labourers and agricultural labourers in Jabalpur and nearby towns. Such has been the suffering of the victims of 'development'.

[This is based on our visit as members of the Committee for the Protection of Democratic Rights (CPDR) to Jabalpur, Bijasen and Seoni on August 23-24. We thank Anurag Modi and the colleagues of the Bargi Bandh Visthapit evam Prabhavit Sangh for arranging our visits to these places.]

CENTRE FOR DEVELOPMENT STUDIES

Thiruvananthapuram

Ph.D Programme in Economics

Applications are invited for admission to the 1997 Ph.D Programme in Economics (full-time) of the Jawaharlal Nehru University/University of Kerala at the CDS. Please write to the Registrar, CDS, Ullloor, Thiruvananthapuram 695 011 for Application Form and Prospectus detailing eligibility, fellowships etc. Completed application forms should be submitted before December 31, 1996.

Emerging from Crisis

Nigel Harris

The reform government of Alberto Fujimori has succeeded in radically restoring domestic security and economic growth of Peru. Nevertheless, this has been at the cost of an inert civil society and over-concentration of power in the person of the president.

FOR up to 10,000 years – roughly as long as anywhere else in the world – cultures of great diversity and sophistication have flourished on the three strips of territory, north to south – coastal desert (with oases), the mountains (the sierra) and the jungle (the selva) – the bulk of which came to form modern Peru. The most famous material employed in the more modern of those cultures was gold, and gold is a symbol of an immense wealth of raw materials in the country. Some have called them 'gifts of the devil' because they have allowed, they say, growth without development, or a development for the mass of the population well below those countries with nothing but intelligence and aptitude as a resource.

The raw materials are impressive – the key mining exports of copper, lead, zinc, and gold (with iron, phosphates, manganese and silver); oil; and immense wealth of sea, farm and forest. The exploitation of these riches supported a 1994 per capita GNP of 2,110 dollars (or 3,610 dollars at PPP). They also supported a manic-depressive cycle of boom and slump, political regimes alternating between expansionist export-led boom liberals and import-substituting economic nationalists, sometimes coinciding with the exchange of military and civil orders. And the growth was characterised by extraordinary levels of income inequality (greater than the notorious cases of Brazil and Mexico), and geographical extremities of wealth, between the coastal oases (particularly Lima with a quarter of the population) and the poor villages of the sierra and the selva.

In the 1990s, the country is returning from two decades of economic nationalism and, latterly, civil war, a period of unmitigated disaster for the majority of Peruvians. In 1992, private sector wage earners received incomes 35 per cent of the 1981 level or 23 per cent of 1973. Real incomes in 1996, after six years growth, were still below the level of 1960. In Lima's downtown, the handsome mansions of the past are half derelict or boarded up, the pedestrian alleys converted to permanent flea markets, selling

cheap clothes and plastic goods. National infrastructure investment declined on average by 6.5 per cent annually in the decade to 1992, so the roads are potholed, the ports congested, power stations creaking. The cost of moving goods is said to account for half the costs of exports (and are 50 per cent above neighbouring Chile). Perhaps the climax of the long nightmare, the great cholera epidemic of 1991 (ultimately spreading as far north as Mexico), is also attributable to the neglect of infrastructure investment – the resulting losses to tourism and agricultural exports, put at \$1 billion, were three times what had been invested in water and sanitation in the 1980s.

Historically, exports were relatively easy. But they were produced by big farmers, financed by foreign banks, or big foreign mining companies, neither of which involved masses of the local workforce. With such a ruling class, the state was required to keep order, not develop the country. The military-civil oligarchy that ran the country up to the 1960s was rarely challenged – the structure of the economy entailed weak social movements, trade unions and middle classes. Abundant exports allowed unlimited imports without local development – by the 1970s, a fifth of the food supply was imported. In the 1990s, it is said that a quarter of Lima's food consumption is imported, implying both a relatively weak relationship between the city and agricultural producers, and a weak stimulation of rural output by urban demand.

I

Like other predominantly raw material exporting countries, Peru's economy has been created by surges of growth in world demand. Growth made immense fortunes and thus the means to create the infrastructure to facilitate exports, leaving much of the rest of the country undeveloped. The guayano boom (1830-81) initiated this pattern of growth, followed by a boom in sugar, copper and silver from the 1890s, in cotton after the turn of the century, in wood and rubber.

Between 1898 and 1918 exports increased eight-fold.

The interwar great depression forced the government into protectionism like the rest of Latin America. However, after 1945, the country was opened up again to exports – copper, oil, iron, agricultural produce and fish (by 1970, Peru was second only to China in the volume of fish caught, 18 per cent, and produced 40 per cent of world fishmeal). It was a military regime that supervised this phase of growth, albeit with a social programme to increase mass education, housing and incomes. Electoral politics returned in 1956, but by the middle of 1967, a major foreign exchange crisis was the prelude to a much more radical military intervention.

In 1968, General Juan Velasco introduced 12 years of the revolutionary government of the armed forces. It was Peru's answer to the innovations of third worldism – of Nasser, Sukarno, Nkrumah and many more in the 1950s and 1960s. Velasco was dedicated to employing the state to rectify the perverse patterns of Peruvian development, to establishing national economic independence, to raising the position of the poor, the Indian (Quechua and Aymara-speaking) of the sierra and the selva. To the eyes of an hysterical Washington, he was a second Castro, and briefly aligned Peru with the Soviet Union. The military government carried out a radical land reform to strip the great landowners of their estates encourage co-operatives, nationalised the oil industry (Petroperu), the larger mines, public services, and a number of industries and part of the press. The borders were closed to most imports in favour of local production. In 1973, the great post-war success story, the fishing industry, was expropriated – and immediately began to decline.

When, in 1980, elected governments were restored, they faced – in conditions of world recession – the onset of a debt crisis (Mexico defaulted in 1982), shrunken exports, high rates of inflation, the beginnings of two major campaigns of rural guerilla warfare – the Sendero Luminoso (Shining Path; members were known as Senderistas), supposedly of Maoist persuasion in central Ayacucho, and the Fidelista Tupac Amaru in the north. Between 1983 and 1985, the GDP shrank by 13 per cent. Nothing daunted, the electorate voted into office in 1985 Peru's famous Left opposition, Apra, under a new president, Alan Garcia.

Under president Garcia, present disasters joined an impressive record of past errors. Apra's diagnosis of Peru's condition attributed economic decline to weak domestic demand, exacerbated by the strain of debt-

servicing. The government increased real salaries and public spending, while unilaterally imposing a limit on the servicing of external debt of 10 per cent of export revenue (this led straight to default and the ending of most credit to Peru for seven years, a disaster for export industries). Expanding spending had some initial success in stimulating growth, but by late 1986, the economy had come to a halt and the external and budgetary deficits were becoming insupportable. There was a flight of capital, the reserves shrank rapidly, inflation soared and real wages declined. In 1988, the government tried to freeze public sector prices, the exchange and interest rates. The economy was paralysed – and inflation reached 30 per cent per month (and at one point, 6 per cent per day). In these chaotic conditions, the guerillas advanced on the one hand, and narcotic traders on the other (Peru produces 60 per cent of the raw material for the world's cocaine), but even more swift was the growth of the official repressive machine, the army and police.

The economic performance was catastrophic. Consider the GDP growth rates: -8.3 per cent (1988); -11.6 per cent (1989); -5.4 per cent (1990), with an average of -0.2 per cent for the decade of the 1980s. Or mining exports (1986-90): -4.5; -3.0; -15.0; -4.9; and -8.7 per cent. Or manufacturing (1988-90): -11.2; -15.7; -5.8 per cent. Or real wages and salaries (1988-90): -23.6; -46.7; +4.4 per cent. Meanwhile the rate of inflation went from 667 per cent in 1988, to 3,399 the following year, 7,482 per cent in 1990 and 4,095 in 1991. The Garcia government soldiered on, accelerating towards the precipice. It bravely covered the yawning debts of the parastatals - 4.2 billion dollars in 1989-90, or enough, according to former privatisation minister Cordova, to build 14,000 12-classroom schools or 42,000 kilometres of road.

In fact, the official picture is misleading. An increasing part of the economy was slipping out of the statistical recording system. Popular ingenuity withdrew the struggle for survival from official view. It was estimated that 35 per cent of employment was 'informal' in 1984, and 44.5 per cent in 1993. As a proportion of total employment, micro enterprises increased from 10.4 to 14.3 per cent in the same period, and street-sellers, from 11.6 to 41.4 (1990) and 50.4 per cent (1993).

If the informal sector was the innocent parallel of the economy, the guerillas were the unofficial version of an increasingly brutalised army. The Senderistas, variously compared to the Khmer Rouge or the Japan Red Army, responded in kind, and both

competed in steadily mounting scale of savageries. Abimael Guzman was the main leader. Child of an important family in the southern city of Arequipa, he is credited with germinating the ideas of Senderismo, drawn from the thought of Mao, in the philosophy department of Ayacucho University (the Chinese connection made his *nom de guerre* 'chairman' Gonzalo, instead of the normal Latin American title of president). The Sendero grew steadily through the 1980s, creating a cadre drawn from the universities and the intelligentsia but with roots in the shanty towns, to peak at about 10,000. At its height, it seemed capable of paralysing the country with impunity, shutting of Lima's electricity supply, destroying pipelines and highways. Through the activities of the army and the guerillas, possibly one million people were displaced and 30,000 or so killed.

Lawlessness – including the growth of the narcotics trade and associated gangs – justified the building of a repressive apparatus of considerable size. The army is still in charge of 15 provinces under emergency rule. The belligerents left a trail of devastation – with possibly 30 billion dollars cumulative losses. There is also a pervasive climate of insecurity. Some Lima houses are still encased in steel cages against the sudden bomb, and factories and barracks have guardhouses high up on the corners of their walls with hooded armed men watching through slit holes. Security guards in flak jackets, police and soldiers are everywhere, loafing or watching.

II

After the experience of the 1980s, political parties in Peru were discredited. Both leading candidates for the presidency in 1990 opposed the party system. To general surprise, a little known university rector, Alberto Fujimori, was chosen over Peru's most famous novelist.

As first priority, the new president gave the armed forces their head to smash the guerillas, and in economic affairs, sharply moved into reverse with a drastic stabilisation programme, major cuts in public expenditure, tight fiscal and monetary controls (with the elimination of subsidies), liberalised prices (in one famous case, the price of gasoline is said to have increased overnight from 17.5 to 21,000 Intis per gallon) and the energetic pursuit of foreign investment and privatisation.

In the case of the repression of the guerillas, the new government was more effective than anyone, in the light of the record of the preceding decade, could have imagined. The campaign culminated in the capture of Guzman in 1992, and in a well publicised

trial, his sentence to life imprisonment. Thousands of cadres were captured or faded away into NGOs in the slum or squatter areas; some, it is said, joined the narcotics smugglers. Political killings dropped by four-fifths by 1995, when 520 died, none of them in Lima. There were new incidents in the middle of this year, but of marginal significance outside the remote coca growing areas. Military intelligence, not the most reliable source in the past, estimates the number of cadres surviving at under 10 per cent of the 1990 level (or between 500 and 1,000), the majority in remote areas and under the command of Oscar Ramirez who, it is said, does not accept Guzman's tactics. Only the sadly defiant slogans remain, with their bizarre echoes of imperatives translated from the Chinese – in London, 'Move heaven and earth to free chairman Gonzalo', and in Lima, 'Overcome the reverse by developing popular war!'

The turn-round in the economy is only slightly less dramatic. In the three years to 1995, the growth of economy averaged 8.7 per cent, the fastest in Latin America. This was partly through increased utilisation of very underutilised capacity. But there was also an investment boom – between 1980 and 1990, gross domestic investment declined by -4.2 per cent annually, but expanded by 10.7 per cent annually in the first four years of the 1990s (while domestic savings increased from 12.5 per cent in 1992 to 17.5 per cent in 1995). Part of this was an inflow of foreign funds; the restoration of stability and positive real interest rates (as well as the opportunities provided by the privatisation of public enterprises) led to an increase in foreign investment from 1.36 billion dollars in 1990 to 7.8 billion dollars in 1995 (equal to 6.9 per cent of GDP between 1993 and 1995, 48 per cent of the inflow being long-term capital). The inflow was partly repatriated funds that had earlier fled, but it covered the external deficit and allowed high imports. Exports were rapidly diversified and grew by 9.9 per cent annually (1993-95). The public sector deficit was cut (from 7 to 1.5 per cent of GDP, 1989-91), and the annual rate of inflation declined to about 10 per cent.

Some four-fifths of the holdings of the state in 1990 have been sold, including telecommunications, mining, electricity generation, fishing, banking and transport, raising some 5 billion dollars for the public exchequer. The government is continuing in the face of some opposition to privatising the oil industry (the first units of Petroperu were sold in March). Finally, Peru has resumed servicing its external debt, and about half the debt has been rescheduled. The cumulative

total is said to be about 30 billion dollars, equal to some 406 per cent of the value of exports (compared to Argentina's 345; Brazil's 262; and Mexico's 171 per cent). The servicing burden takes about 64 per cent of export earnings.

In 1992, the president claimed that the bureaucracy of the state and the old political parties campaigned to dilute or obstruct his reforms. With the support of the army (although one general tried to lead a coup), he suspended the constitution and the assembly. He argued that the line ministries were incapable of offsetting the social effects of the reform programme, and sacked about 45 per cent of the workforce. He concentrated the powers in an expanded office of the presidency and a number of parastatal organisations. The new constitution created a new, smaller and single-chamber assembly, banned political parties in elections, and allowed, for the first time, the president to run for a second period in office (in the 1995 presidential elections, Fujimori was again victorious).

Perhaps others had higher ambitions. In the late 1980s, the military are said to have prepared a plan, the so-called 'Green Book', to establish an authoritarian regime in Peru for 15 or 20 years to once-and-for-all supersede the chaos inflicted on the country by elected governments. The person said to have been centrally involved in the preparation of the plan is now a high adviser to the president and in charge of his intelligence services, Vladimiro Montesinos. Montesinos as an army captain in the 1970s, was charged and jailed for spying for the CIA.

Be that as it may, the president made considerable efforts to develop anti-poverty programmes. Spending on social sectors, on official claims, was more than doubled in per capita terms (from 64 to 134 dollars or 10 per cent of GDP). Educational expenditure was also expanded, and a programme of building new schools is very evident, covering 88 per cent of the relevant age groups. However, there are immense deficits to be made up – there may be shiny new schools, but the pay of teachers is only one-fifth of what it had been a decade earlier, there are few books, equipment or infrastructure (many rural schools lack electricity or drinking water); the drop-out rate in some rural areas is said to be 60 per cent. Spending per student is still only a fifth of the 1970 level. There has been a similar drive to extend health clinics, but still there are great maldistributions – in Lima, there are 800 people per doctor, but 12,000 in the poorest provinces; hospital beds range from 1 per 666 people in the capital to 1 per 1,250 elsewhere.

III

The most severe problems of Peru concern the striking level of cumulative poverty and inequality, exacerbated by two decades of economic mismanagement. Inequality has always been an issue – in the 1960s, the poorest 40 per cent received 8.8 per cent of personal income (compared to 14 per cent on average for 43 developing countries). Sustained growth between 1950 and 1966 seemed only to make this worse – when per capita income increased 2.1 per cent annually in that period, the 'modern sector' increased 4.9 per cent; the urban, 2.0; and rural Peru, 1.3 per cent. While the coastal areas took the lion's share, the poorest – non-coastal small peasants – experienced no increase: they were not connected to the central dynamic of the economy.

In the years of military and nationalist rule, the problems worsened. Between 1970 and 1980, the proportion of the urban population in poverty increased from 28 to 45 per cent (and those in extreme poverty, from 8 to 16 per cent); the rural poor decreased from 68 to 64 per cent (and those in extreme poverty stayed the same at 39 per cent). There was some reversal in the 1990s, although still around half of the population is officially poor (but the extremely poor did decrease, from 24 to 20 per cent). In Lima, poverty declined from just under a half of the population to a third; in the urban sierra, from 47 to 46 per cent, and the rural sierra, from 68 to 66 per cent (there was no data on the thinly populated selva). The Indian-language speakers fared much worse – 42 per cent of the Spanish-speakers nationally are poor (and 13 per cent very poor), compared to 60 per cent of those who speak Quechua (a third are very poor), and 86 per cent of those speaking Aymara (70 per cent are very poor). For Indian women in the rural sierra, conditions are the worst. The measures are duplicated in each sector. Over a third of the rural population is illiterate, but 70 per cent of rural women.

However, despite the record in income, the figures on the average expectation of life have not deteriorated and now stand at 66 years. Infant mortality is nationally 64 per 1,000 – but in Lima, 26, and in the rural sierra Huancavelica, over 100. In the 1990s, consumption for the poorest fifth of the population improved by 32 per cent, a change made possible, it is said, more by the establishment of peace so that farmers can get their output to market than any public social programme.

The severe deprivation of thousands of remote Andean settlements – mainly of Quechua and Aymara speakers – is a key

target for public action. Yet the state is still a major obstacle to effective public action paralysing and paralytic, combining a bloated and inefficient executive, an irrelevant and fractious legislature, and a painfully slow and corrupt judiciary. Furthermore, the civil apparatus is now overshadowed by the security arm, the army, police and intelligence services, backed by a famously brutal prison system. The army directly controls a major part of the country (which includes those areas where coca is grown), and by reputation, it is more terrifying than the guerrillas were – even if the 1995 clash with Ecuador suggests it was less effective against a foreign army.

The state, armed and civil, has come to be centralised on the person of the president. Thus, the reform government that has radically turned the country round in terms of domestic security and economic growth has nonetheless immensely exaggerated the traditional issue of the concentration of power – a ceaselessly active president and an inert civil society. The president is in perpetual daily movement, a Santa Claus delivering presents to the most remote areas, through his whirling helicopter personally holding the country together.

His key political base is the army. He purged the high command before the 1992 coup, and in return, the army gave undivided loyalty to the coup. He has protected the army against the numerous accusations of brutality, murderous injustice and corruption. In June last year, he slipped through the assembly an amnesty law to protect the armed forces. His supporters have restructured the intelligence services and have expanded them to include all agencies, including the army. He has also tried to enhance the popular image of the army by pushing it into rural development projects – organising health services and emergency food supplies. Up to late 1995, the president rejected the evidence of military involvement in the narcotics trade, but he has now supposedly accepted the accusation and ordered the army to end its involvement in counter-narcotic activities. The reprimand seems hardly likely to deter anyone.

So far, the popular loathing for the 1980s has meant the president has been popular, with a 60 to 70 per cent approval rating in the polls. The popularity does not extend to his minions – his candidates were defeated in last year's municipal elections, most dramatically in Lima. He won a second term as president, and now his supporters in the assembly have, by means of some neat constitutional footwork, forced through a legal amendment that allows him to run for a third term (2,000-2005). He does not need a Green Book.

However, it is at this stage that elected political leaders usually overreach themselves and start going into terminal decline. The projected rate of growth for 1996 is down to 2.3 per cent (the soothsayers foretell a resumption of 6 per cent growth for 1997-99), much below what is needed to get Peru back into its peak prosperity. The external debt situation still remains very threatening. And the narcotics issue will not go away while Washington is concerned – Vladimiro Montesinos, a key security adviser to the president, has just been accused by a top narcotics trader on trial of taking bribes of 50,000 dollars per month to secure army protection to fly his cocaine cargo out of his airstrip. The charge has been denied, but less well known army chiefs in key localities are almost certain to be involved in the drugs business.

President Fujimori can ride these still small waves, but sooner or later, his triumphs will be forgotten and he will come to be hated for directing a virtual dictatorship. It is the natural justice of populist regimes. At that stage, civil society will come back into its own. There are few traditional institutions left – political parties are lying low; the judiciary is discredited; the trade unions defunct; regional and local authorities severely weakened. Only the NGO sector seems to be flourishing.

The country is rich and has, as it always has had, great opportunities. As so often, the economic promise is constantly frustrated by the fantasy world of government and, despite all the protestations and reams of policy paper, the apparent frequent indifference of politicians to the fate of their citizens.

potent drug cocktails. These are the reasons for which Helen Gayle, who heads the AIDS programme at the centre for disease control and prevention in Atlanta, cautioned the delegates that there is yet "no cure on the horizon".

Too much optimism for finding a cure for AIDS in near future could create a false sense of security, leading many people to drop their guard against unsafe sex and other risky behaviour on the assumption that they could be cured if they did become infected. Some fear that medical science could get a huge black eye if a widely publicised effort to cure AIDS fails. Another fear is that widespread publicity about success in AIDS treatment could threaten – with disastrous consequences – funds for useful AIDS prevention programmes.

The most crucial constraint on the use of any AIDS drug in developing countries is its prohibitive price. The cost estimates talked about in the conference for a year's course of the new therapy ranged from 10,000 to over 15,000 dollars. But figures estimated by some actual users in the US are much higher even for the drugs being used so far. Larry Kramer, a prominent homosexual activist, recently wrote in a *New York Times* magazine article that the cost of his current drugs, which do not include a protease, amounts to 19,000 dollars a year. He thinks that full-blown AIDS patients can find their drug cost around 1,50,000 dollars. Improvement in manufacturing technology, economies of scale and competition between drug companies may bring down the price to some extent. But even then these drugs will remain a far cry for millions of HIV carriers and AIDS patients in developing countries.

In any case, the wide publicity given to the new drugs in the conference will benefit a few drug companies and some medical scientists aspiring for Nobel Prize and other similar awards.

The only feasible option for dealing with the growing AIDS menace in developing countries is to control it through prevention programmes aimed towards behavioural changes in sexual activities and addictive drug consumption, adequate supply of safe blood for transfusion, etc.

Peter Piot, executive director of UNAIDS, pointed out in his opening speech at the conference that India has by now the highest number of HIV-infected persons (3 million) in the world and that the number is increasing at a very rapid rate. But India got very little attention in the conference proceedings and the media as well, although a large contingent of government and non-government delegates from India attended it. Even African and other developing

AIDS Extravaganza in Vancouver

Moni Nag

By focusing on the recent advances in the treatment of AIDS patients, the international AIDS conference in Vancouver and the media covering it failed to highlight the more immediate need to expand the AIDS prevention programme in developing countries.

INTERNATIONAL AIDS conference (July 7-12) in Vancouver was attended by about 15,000 delegates. Over 15 million dollars were spent. Delegates dined well in magnificent hotels and enjoyed well-planned sight-seeing tours. Hundreds of speeches were made, hundreds of papers presented and hundreds of journalists were busy in reporting selected proceedings all over the world.

But what did the conference achieve, particularly for controlling the rapid spread of AIDS globally and for the victims of AIDS in developing countries where over 90 per cent of all persons infected with HIV (virus that causes AIDS) live? Very little. Delegates from these countries presented interesting papers based on prevention programmes in their respective countries but did not learn much that would be of use to them.

The conference, and the mass media reporting it, were dominated by the news of recent advances in the treatment of AIDS patients. So far there is essentially one major drug, AZT, which, in combination with a few other drugs of the same family, is moderately effective in slowing the progress of HIV in causing full-blown AIDS. But

AZT is highly toxic and practically unaffordable in developing countries. A few medical scientists working mostly in the US laboratories presented their findings on a whole new family of drugs called protease inhibitors. By combining these new drugs artfully, they have succeeded in suppressing the HIV in a small number of patients for limited periods of time. In the most dramatic experiment, the virus became undetectable for up to 300 days after participants started taking a three-drug combination.

A few scientists claimed that the new evidence suggests the possibility of finding in near future a drug treatment that might completely cure AIDS that has been so far largely incurable and almost invariably fatal. But to critics, merely raising the possibility of cure at this stage is far too premature and also perilous.

Nobody knows for sure that the new treatments will work over the long term. They can cause severe side-effects, like kidney stones and nausea. Many patients will find it extremely difficult to take more than 15 pills a day indefinitely – often on an empty stomach – and at precise times. It is also possible that the wily AIDS virus will eventually develop resistance to the new

countries where full-blown AIDS has already created a havoc did not get the importance they deserve.

Many delegates from developing as well as industrialised countries had experience of working in AIDS prevention programmes. Papers describing moderate to remarkable success in reducing the incidence rate of HIV infection and/or changing favourably risk-prone behaviour of targeted groups were presented. A few examples are cited below.

In sub-Saharan Africa, condom sales increased from one million annually in 1988 to more than 167 million in 1995. Uganda's educational campaign which started in mid-1980s is now paying off. Alongside more condom use, people are practising abstinence and many young people are delaying first intercourse. As a result, HIV incidence is declining. If Uganda, one of the poorest countries with sexual behaviour pattern highly favourable to HIV transmission can reverse its trend, there is definitely hope for reversal in other developing countries. More than three-fourths of all adults living with HIV/AIDS worldwide are in sub-Saharan region but, for various reasons, there is a

great variation within the region. Adult HIV prevalence rates range from 0.1 per cent in the Comoros to more than 18 per cent in Botswana.

In Thailand, aggressive condom promotion and enforcement of condom use in red-light areas have led to significant decrease in HIV transmission in men, particularly among the young. In Australia and New Zealand, prevention programmes of the governments in co-operation with gay organisations have helped lower HIV prevalence within the gay population. In the US and some other European countries, programmes for free distribution of injection equipment to intravenous drug users have reduced the practice of equipment-sharing and thereby controlled the spread of HIV among them.

In India, prevention programmes initiated by non-government and government organisations in red-light areas of some cities have shown remarkable success in increasing the use of condoms among female sex workers and reducing the prevalence of sexually transmitted diseases among them. Powerlessness of female sex workers to make their clients use condom – often cited as a serious constraint on the use of condoms –

appears to be slowly overcome in programmes which go beyond education and free condom distribution.

One common component of successful programmes has been the use of female sex workers themselves as peer educators and condom distributors. It seems that helping the sex workers to form their own associations, co-operatives, etc. can empower them to resist exploitation by clients and other groups involved in sex industry. The AIDS prevention project led by the All India Institute of Hygiene and Public Health in a red-light area of Calcutta (where the HIV prevalence is still around 4 per cent while in many other Indian red-light areas it ranges from 30 to over 50 per cent) provides a good example of the latter.

The papers describing findings like the above did not generate as much intensive discussion and publicity as they should have. It is unfortunate that the Vancouver conference has missed an excellent and timely opportunity to become an international forum for valuable exchange of information and views regarding appropriate strategies for controlling HIV/AIDS in varieties of socio-cultural settings.

New from Oxford

Feeding the Baniya

Peasants and Usurers in Western India

David Hardiman

In this detailed and comprehensive study of the relationship between peasants and Baniya usurers in western India, David Hardiman examines how and why usurers have, over the centuries, managed to exert their power over the peasantry. An explanation purely in terms of the economics of the relationship is, he argues, not adequate. But over and above this is the ideological or hegemonic power that Banias have been able to exert over their clients.

Public Faces, Private Voices

Community and Individuality in South India

Mattison Mines

Individuality is often seen as an exclusively Western value. In non-Western societies, collective identities may seem to eclipse those of individuals. The generalizations, however, have overlooked the importance of personal uniqueness, volition, and achievement in these cultures. *Public Faces, Private Voices* weaves together personal life stories, historical description, and theoretical analysis to define individuality in South Asia.

Hours in the Dark

Essays on Cinema

T.G. Vaidyanathan

This collection of essays covers nearly three decades of film criticism by him. The book gathers together his essays on individual films in several languages, both Indian and foreign. The essays are energetic and acerbic, often partisan, but never dull. Written in an approachable style, they bring alive years of movie-watching in a manner neither entirely journalistic nor academic.

Redefining Development

An Alternative Paradigm

Bagaram Tulpule

An examination of the implications of an alternative development paradigm for important areas such as agriculture, industry, energy, capital and the respective roles of the market and the state.

THE only model of development placed before us today is the one represented by what are called the 'developed' or industrialised countries. The rest of the countries in the world in different stages of underdevelopment are straining to develop according to the same model, with varying degrees of success. A few have reached the threshold and are about to enter the developed countries' club. At the other extreme, large parts of the world, especially in sub-Saharan Africa, as well as large segments of the populations within many countries at intermediate stages are altogether excluded from this process of development.

Whether some of the ancient civilisations of China, India, Central and South America left to themselves would have evolved other models of development remains a moot question. For they were not left to themselves but became victims of aggression and subjugation by the so-called developed countries. The economies of these countries were systematically destroyed, their natural resources plundered, their productive systems and skills undermined, their flourishing trade choked, their surplus food-producing agriculture turned into commercial plantation agriculture for the profit of the aggressor countries. Systematic plunder of the rest of the world mainly through superior military strength and to a lesser extent through technology, which itself was a factor in superior military strength, led to the affluence of the handful of imperial countries and the affluence, in turn, increased their technological and military strength. In the New World, a vast continent, or rather two continents, were appropriated to themselves by these conquerors, the indigenous populations there were virtually exterminated. What little of these survived were driven to lead a marginalised existence. The few who attained the status of masters of that continent laid the foundation of their own affluence and development by capturing human beings in Africa and making them work as slaves in the New World.

The consequences of the prevailing developmental model are becoming increasingly evident globally, even in the developed world, over the past two decades

and more. Economic growth in the industrial countries has slowed down greatly, unemployment remains stubbornly at high levels, real incomes of working people are falling and industrial countries are increasingly resorting to restrictive trade practices in violation of the spirit of the much vaunted recent global trade agreement. The gap between the industrial and most of the developing countries is getting wider. Finance capital controlled by a handful of banks in the industrial countries has come to dominate the global economy. Speculation in currencies has become the dominant economic activity far outstripping the global output of goods and services. Ratio of foreign exchange transactions to the volume of world trade in goods and services has jumped from 10:1 in 1983 to 60:1 in 1993. Currency turnover in the international market is rising fast. At \$1.3 trillion a day, it is by far the largest market in the world. World GDP is of the order of \$25 trillion per year.

Within the industrial countries, the rich-poor divide is becoming sharper, the US being the most unequal country in the world. Tensions among the industrial countries are becoming more intense. There is a heavy and increasing flow of capital resources from the poor countries to the rich while the poor sink deeper and deeper in debt.

TECHNOLOGY AS IDEOLOGY

Technology today has come to be raised to the status of an ideology. According to this ideology, technology is in itself benign. All problems of humanity can be solved through technology and without it no society can progress or develop. The newer a technology, the better it must be. Further, we are also told that the global sweep of technology is inexorable, unstoppable. The votaries of technology believe that anything that can be made must be made with technology. Thus raised to an 'ideology', critical examination of its negative aspects and objective evaluation or any discrimination among different technologies, their relevance to specific problems and socio-economic conditions become difficult. Perfectly serviceable productive systems and equipment are rendered obsolete through the

arrival of newer technologies and this process is viewed as 'creative destruction' although in reality it is creative for a few, destructive for many.

There is no doubt that technology has increased the power of the human body and mind to an incredible extent. It has also created new materials, products and services, several of which have the potential of making human life longer, happier and more fulfilling. But the role of technology in human history has not always been benign; it has been equally destructive even for the industrial countries. For the rest of the world, technology has been largely a destructive power in the hands of the dominant countries leading to conquest and enslavement of a large part of the world, ruthless exploitation and even destruction of their natural resources and impoverishment of their peoples. Historically, the most powerful thrust of technology has been in military applications. In that field, technology has given to the only surviving superpower the opportunity to dominate the whole of the rest of the world. The awesome destructive power of present-day military technology as well as its ruthless use was demonstrated not so long ago in the Gulf war.

Technology is not value-free nor neutral to the socio-economy structures in which it operates. It inevitably leads to the strengthening and enrichment of the social segments that are already strong and rich and to increasing exploitation and marginalisation of those who are poor and powerless. This happens both within and across countries. It also has the effect of tearing apart the fabric of societies. The rich, powerful and technologically dominant section of the societies in different countries, both developed and developing, becomes a single, distinct global segment acting together to their mutual profit and moving further and further away not only economically but also socially, culturally, intellectually and ideologically from the rest of their own societies. This fragmentation is particularly conspicuous in the developing countries in which the life-styles and life-expectations, dress, language, education, recreation and communications of the elites are closer to those of the elites the world over than to those of other segments of their own societies. Indeed, the life-expectation of the sons and daughters of the elites is to leave their own societies and become part of the industrialised societies.

We have only recently begun to realise that the present mode of development is causing widespread and grave damage to the environment and to the entire ecosystem of the planet. Pollution of air, water-streams and even of the seas and destruction of forests and of the diverse species of flora and

fauna therein and of the habitats of large masses of people are rampant. Bloated metropolises in which the majority of the people live in slums without elementary civic services, beef contaminated with the mad cow disease because cattle who evolved in nature as herbivores are fattened on cattle-feed processed from the remains of sheep and other animals slaughtered in abattoirs, damage to the ozone layer, global warming, etc, are diverse instances of the consequences of the present mode of development. Many more can be cited. Some noises are being made lately here and there about these dangers. Development, however, rushes headlong without really bothering about the trail of destruction it leaves behind so long as the market yields profits.

SOCIAL COSTS

The social consequences of this so-called development are no less grave. Vast segments of our population have been entirely left out of this development. Worse still, hundreds of millions of the poorest and most downtrodden of our citizens are being forced to pay the cost of this development through ejection from their homes and lands, deprivation of the resources of their livelihood such as land, water, jungles, fisheries, etc, spreading unemployment among organised industries and marginalisation of small artisans and craftsmen. Even the most rudimentary education and health services are unavailable to tens of millions. Hundreds of thousands of villages continue to go without safe drinking water and their number rises every year while tens of billions of rupees are spent on mega-projects of dams and irrigation. At the other end, a small segment of the society which is the main beneficiary of this development amasses vast wealth and political power and indulges in obscene conspicuous consumption. Our industrialists are happily hitching themselves to the apron-strings of multinational corporations in the hope of reaping large and quick profits with little risk while the country as a whole sinks deeper in the internal and external debt trap.

Blind pursuit of wealth, profits and the goodies of life has spawned crime, drug smuggling and addiction, gang wars, land grabs, extortion, kidnapping and abduction, large and mega scams of all kinds, corruption at the highest levels and rampant crimes against women. Strident, vulgar advertising creates market demand for ever new products of questionable value, if they are not actually harmful. Beauty of women and talent of sportsmen have become grist to the mills of profits through high pressure advertising. Child prostitution and sex tourism get acceptance as a part of this development process.

Life for citizens, even the relatively well-off ones, is becoming increasingly insecure, especially due to the nexus between criminals

and powerful politicians. The state purports to counter this insecurity by making greater use of the police, who often actually use their powers more against common, peaceful, law-abiding citizens than against organised crime sheltered by politicians. Before our very eyes, we are gradually becoming a police state.

It is important to realise that what is happening is not due to the avarice or wickedness or perversity of some individuals. Tensions generated by the ever widening chasm between the rich and powerful few and the impoverished, exploited and oppressed many and a blind scramble for wealth and power can have no other consequences, as is being seen even in the developed world.

A key element in the present developmental ideology is reliance on a free global market. By permitting free competition on a global scale by profit-seeking producers to satisfy the demand for goods and services it is believed that optimum economic outcomes in terms of efficient resource allocation, production, distribution and rapid economic growth follow. If in the process, the strong drive the weak out of competition, needless and even harmful products are thrust upon consumers through high pressure advertisements and the whole productive system gets skewed in favour of the rich and the needs of the poor get ignored as they lack purchasing power in the market, as is in fact happening in our society today, we are glibly assured that these negative effects of the market will be only short-lived. Rapid growth, we are told, will automatically bring prosperity even to those who are poor today.

Without going into a full discussion of the merits and demerits of a free global market as the engine of development, it needs to be recognised that conceding supremacy to the free market in economic affairs makes the very concept of a society's development strategy meaningless. For, development or lack of it then becomes the outcome of the interplay of market forces, too complex, imponderable and unpredictable to be brought within a policy frame. What is produced, how, how much and for whom and sold at what price, all gets determined by free competition in the market and by comparative profitability. Investment also follows the signals put out by the market. Welfare, social justice and environmental conservation can be meaningfully pursued only to the extent a society has the will and the strength to curb and regulate the market. Thus even at a conceptual level dependence on a free global market does not appear consistent with any definite strategy even for economic development, much less so for development in the full sense of the term.

This so-called development is nihilistic. Not founded on any basic human and social values, it has degenerated into blind, ruthless pursuit of wealth, power, pomp and pleasure by every individual who has the means and

opportunity to engage in such pursuit. For the vast mass of humanity who do not have such means and power, expropriation, oppression, ignorance and disease is the lot.

ALTERNATIVE PARADIGM: VALUES AND GOALS

Genuine development must be, above all, human development. The development of all human beings in the society must be its central concern. This development must be not only economic but also of the total personality: social, psychological, spiritual. It should provide opportunity to every human being to grow to the highest stature his innate personal endowment will enable him to. And such developmental opportunities and resources must be ensured not only to the present generation but to the generations to come. That is to say, genuine development must be sustainable.

Such development cannot be left to the mercies of those who control and manipulate the invisible hand of a free global market. Nor will it flow automatically from some allegedly inexorable processes like globalisation, private enterprise or high technology. It will need to be firmly rooted in a set of basic values, human and social. Only such values will guide the society in the identification of right goals and objectives and give right direction to its endeavours.

One does not have to look far to discover these values: they have been staring us in the face all along. We routinely, ritually swear by them all the time. Truth, peace, compassion, non-violence, freedom, equality, harmony with nature and with other living beings, self-reliance, dignity of labour: these are the values development must be based on. I do not think any elaborate argument is needed to justify these values; they are self-evident. A society that disregards these values cannot develop as a really free, just, peaceful, happy, creative, stable society.

To fully live up to these values in all our actual actions in the existing society may be difficult because of our own weaknesses and imperfections. Occasions will arise when circumstances beyond our control make it unavoidable to knowingly deviate from the path dictated by these values. Sometimes it may be that some among these values may appear to run counter to one another so far as the actual course of action is concerned. Such contingencies must however be recognised as aberrations and compromises, not as negation of the values themselves. Our endeavour both in individual actions and in social efforts must ever be to internalise these values and continuously seek to live by them.

The goals, objectives, processes and policies of genuine development should flow naturally from the set of basic values that the society accepts. They must be truthful and transparent and all must know what is being contemplated or done in the name of development, and why. Equally importantly, development should consciously endeavour

to create conditions in society in which untruth, deviousness and subterfuge will not need to be resorted to by the state in relation to its citizens, by one class or section of the society in relation to another, by one country against another or by one citizen against others. Truth and transparency must be the prime characteristics of genuine development.

POVERTY ERADICATION AND EQUALITY

Full development of an individual is not possible so long as he lives in dire poverty and his basic needs are not met. Poverty eradication must, thus, be a principal goal of development. Poverty can be eradicated only by producing in sufficient quantity the goods and services to satisfy the basic needs of all people. These must obviously include food, clothing, shelter, health, education and a modest level of essential comforts. Further, the goods and services produced must reach the people.

The goal of development must also include making available to the people increasing quantities and variety of goods and services to enrich their lives physically, intellectually and culturally. In other words, development should not mean only providing subsistence to people but should provide rising standards and quality of life for all. At the same time, spending social resources in producing ever new, unnecessary and even harmful things and artificially creating demand for them through loud and misleading advertisements, thereby promoting mindless consumerism for making quick profits, can have no place in the objectives of genuine development.

In a poor country like ours, the basic needs of all people cannot be satisfied while a small segment of the society has opportunities of making vast fortunes and appropriating to itself, often by unlawful and dishonest and even violent methods, a disproportionately large part of the social product. Its consumption and the means which enable it to indulge in such consumption will need to be severely restrained. This segment of society will, no doubt, raise the cry that we are distributing poverty. But as Gandhi said long ago, the earth can provide enough for everybody's needs but not for everybody's greed.

There are some who argue that nature itself does not favour complete equality. This argument is specious. The present inequality in society is not the result of natural causes but is patently caused by manmade inequities. These inequalities can be mitigated to a great extent by human will and effort. Any residual inequalities resulting from differences in the inherent talents and capabilities of individual men and women can never be as glaring as at present nor can they be permitted to become the means of oppression and exploitation of the many by a few.

Inequalities of income arise mainly from inequalities in the ownership of assets: land, capital, education, health, caste, gender and

so on. To promote equality in society, the present grossly unequal ownership of economic assets will have to be remedied. Similarly, the handicaps imposed upon many due to lack of access to education or health services will have to be removed. Social inequalities arising from caste and gender are also a serious challenge in the pursuit of equality which will need to be purposefully met.

In a society as unequal as ours, mere formal equality will, in fact, further harden the present inequalities. Genuine equality can be promoted only if those who are weak, oppressed and exploited today are actively helped and supported to become strong.

An important goal of development must be to provide the maximum degree of freedom to all citizens. This requires that freedom from want and freedom of conscience, expression, association, movement and peaceful protest in pursuit of one's legitimate interests must be ensured for all citizens subject only to the condition that one person's exercise of his freedom shall not encroach upon another person's legitimate freedom nor do palpable and grave harm to the society as a whole.

Development of our conception must aim not only at protecting the environment but also nourishing it and promoting respect for nature and other living beings as rightful co-tenants of our planet. Humanity must achieve its development not in competition or conflict with nature but in harmony with it.

Humanity in its drive to secure more and more of everything for itself has drawn recklessly on natural resources like land, water, forests, minerals, animals and other precious resources and polluted where it has not depleted these resources to a point where the very survival of life itself on our planet has become problematic. Such destructive development cannot be sustainable. That is to say, it cannot ensure that the generations to come will find at the least, the same quantity and quality of productive resources as our generation did.

SELF-RELIANCE

Development to be really oriented to the satisfaction of the genuine needs of our people at large must be self-reliant and carried on with the full and creative participation of the people themselves. Dependence on external aid and agencies undermines our confidence in ourselves, pre-empting the growth of our capabilities and dulls the edge of our own efforts. Such external aid never comes without strings of some kind and there is very real danger of such dependent development, if it takes place at all, pushing us under the tutelage of external forces, be they other countries, international financial institutions, trade bodies or multinational corporations.

Growth of production of goods and services must be achieved self-reliantly making the best possible use of resources available to us

internally. We must learn to do without things for which we have to depend upon other countries, except under some really compelling circumstances. Especially for the basic needs of the mass of our people such as food, shelter, clothing, reasonable health and educational services, etc., our self-reliance must be absolute. Fortunately, the country has all the resources really needed for the purpose of such self-reliance.

This is not to say that India should cut itself off from international trade. There will be a few things we need and cannot produce ourselves. There will also be some products in which we have a comparative advantage and other products in which some other countries have similar comparative advantage. Hence, some international trade will not only be unavoidable but also desirable. But self-reliance will demand that we import only as much as we can pay for through our exports. Becoming dependent on ever increasing imports and therefore making exports an overarching imperative to the virtual exclusion of the needs of our own people cannot be permitted in the alternative development model.

Genuine development must aim at promoting due recognition of the dignity of labour. Work, both mental and physical, is essential for the proper development of personality and talents of an individual in the full sense of the term. Work must also be viewed as an important activity for promoting equality in society. An able-bodied person who does not work must be recognised as a parasite. Conditions which permit such parasites to amass wealth and command respect and power are wholly inconsistent with genuine development.

Dignity of labour can have some meaning only when the society provides opportunity for every individual to perform socially useful work and rewards such work at its intrinsic value to the society, not on some caste or class based traditional ideas of what is higher or lower work. The prevailing reward structure for work will need to be overhauled drastically if dignity of labour is to be a reality and not mere rhetoric.

Is a developmental paradigm based on the values and goals outlined by me so far a mere fantasy, an impractical utopia? Worse still, is it reactionary, antediluvian? Most people among that class which is the principal beneficiary of the prevailing model of development will, no doubt, say so. Also those strongly influenced by the mass media controlled and exploited by the same class to further its own interests will also be induced into thinking so. But for a large majority of our people who bear the cost of the present development, but obtain little benefit from it, an alternative path will be the only hope.

The question whether an alternative model on the lines outlined by me is feasible or not may not however be dismissed so summarily. We shall, therefore, try to take a closer look

MAHARASHTRA STATE LOTTERY

DIWALI BUMPER DRAW

ONE COMMON PRIZE OF RS. 51 LAKH (GUARANTEED)

Five series – Total 5 lakh 87 prizes

TOTAL AMOUNT OF PRIZES Rs. 2 CRORE 28 LAKH 85 THOUSANDS.

FEATURES

- ☆ 20 prizes of Rs. 1 lakh each
- ☆ 15 prizes of Rs. 50,000 each
- ☆ 5 prizes of Rs. 25,000 each
- ☆ 90 prizes of Rs. 5,000 each
- ☆ 450 prizes of Rs. 1,000 each
- ☆ 4,500 prizes of Rs. 100 each
- ☆ 45,000 prizes of Rs. 50 each
- ☆ Total 4 lakh 50 Thousand prizes of Rs. 25 each on last digit

CONSOLATION PRIZES:

Total 6 prizes of Rs. 10,000/- each for the ticket numbers immediately preceding and succeeding the common prize winning number and also for the said number in non-winning series.

Draw: On November 16, 1996 at 4.30 p.m. at Mumbai

Ticket price Rs. 10/- only

THE COUNTRY'S MOST TRUSTED LOTTERY – MAHARASHTRA STATE LOTTERY.

at some important aspects of development from the viewpoint of feasibility of the redefined model. It is obviously not possible to draw here a complete blueprint of an alternative development plan. We may however, examine its implications for some important fields like agriculture, industry, energy, capital, the market and so on. We shall also need to see what role the state will have to play in this model.

ISSUES IN AGRICULTURE

Agricultural land in our country, as is well known, is extremely unequally distributed. Marginal holdings which constitute about 59 per cent of all holdings, operate a mere 14.9 per cent of the land while 9.2 per cent of the holdings which are medium and large operate as much as 44.6 per cent of the land. The number of landless labour working in agriculture was 7.5 crore in 1991 and is continuously rising. This kind of distribution not only violates all norms of equality and equity but is also a serious obstacle in development as a whole. By keeping a large proportion of our population at or below the level of subsistence, it pre-empts the emergence of a mass market for other kinds of goods and services. It is usually forgotten that South Korea, whose model we are exhorted to emulate, started after the second world war with a more or less equal redistribution of land. In contrast, land reform legislation intended to bring about a more equitable land distribution was never enforced purposefully in our country and since 1991 commercialisation of agriculture and inviting large companies including multinationals into this field is being favoured. More equitable redistribution of land, however, is not only an equity imperative but also a developmental imperative.

Experience of the past half century has clearly demonstrated that large dams and irrigation projects are not an answer to the crucial challenge of making water available for agriculture. An investment of Rs 11,107 crore on such schemes during the Seventh Plan has, according to the ministry of water resources, not only not resulted in the creation of any additional potential, but has resulted in the loss of 0.6 million hectares out of the potential that existed at the end of the Sixth Plan. In the minor and medium sector, the potential created between 1950 and 1990 was 20.2 million hectares out of which, according to the ministry's own claim, only 15.8 million hectares had been utilised. According to land-use statistics which are much more credible, the unutilised gap in 1990 was 9 million hectares, nearly 44 per cent of the potential.

It is now widely recognised that small irrigation projects, watershed development, rainwater harvesting and such other methods are far more efficient and cost-effective ways of ensuring water for agriculture. They do

not inundate large agricultural and forest lands, cause little soil erosion, do not displace lakhs of tribals and other poor from their homes, discourage wasteful use of water, provide work for large numbers of people, place irrigation within the initiative and control of the farmers themselves than of the bureaucrats and are not ecologically damaging. Storing water by recharging the underground aquifers also prevents loss through evaporation.

An equally important issue is the use of modern technology in agriculture. It is now being realised that excessive use of chemical fertilisers, pesticides and water is causing salination and waterlogging of farm-lands in many parts of the country, not to mention the huge subsidies they involve. Use of farm machinery is displacing labour from agriculture. Devices like drip irrigation can be availed of only by the relatively large, affluent farmers. It has been demonstrated that generous use of biomass for soil conditioning, need-based use of water, organic manures and pesticides and such other inputs can ensure reasonable levels of land yields. Conservation of genetic diversity in which we are so well endowed is also an important objective which natural farming can serve.

The alternative development paradigm will also prevent diversion of cereal lands to horticulture, floriculture, fruit growing and, most outrageous of all, to prawn ponds, all intended to yield profits for a few at the cost of expropriation of the many.

INDUSTRIAL DEVELOPMENT

In the field of industry, the questions that must be asked are: What will industry produce and for whom? What methods and technology should be used for production? Who should own industry? How will the inputs needed for production such as capital, raw materials, energy, etc, be found? And so on.

Ours is an extremely unequal society. So the question what will industry produce becomes crucial. Our answer to this question must be: priority must go to producing goods and services really needed to satisfy the needs of the broad masses of our people, not to cater to the demands of the relatively affluent few. The production systems and technology must be such as will not demand huge investment of capital and will provide gainful work for increasing numbers of our people. For, if people do not find work and earn income, goods and services produced for them will not find a market. Hence, in the alternative model, industry must integrate within itself both these concerns: satisfying needs of common people and generating as much employment as possible. All other aspects of industrial policy will have to be built around this principle.

Today, production and employment are bifurcated. What is produced is determined by the market. Production is sought to be

achieved through modern, centralised, capital-intensive, high technology systems which generate little employment. Employment is sought to be generated through sundry rozgar yojanas whose productive value is doubtful. Ideally, the development process should itself generate production as well as jobs as two sides of the same coin, not as two distinct objectives to be pursued through different systems without any relation to each other.

Integrating production and employment and orienting it to the real needs of the people at large means that our productive system as a whole must be labour-intensive, small or medium scale and at a modest level of technology. Such a productive system also lends itself readily to decentralisation.

This, of course, does not mean that all industries in the country will produce only for the immediate and direct consumption of common people. Production of such goods will itself need several different kinds of materials, machines, tools and energy. Industries to produce these capital goods and other inputs will be needed. But even in the establishment of these capital goods industries, the overarching considerations must be: what will be the ultimate consumer-product and for whom, and will the capital goods industry generate jobs commensurate with the investment and output?

While operationalising the central principle of integration of production and employment, certain overriding needs of the society will have to be borne in mind. Some compromises will have to be made. But while making such compromises the essential nature and priority of such needs must be assessed with a proper sense of priorities and proportion. For instance, exports are currently viewed as an overriding national imperative. We need, no doubt, to import certain goods and foreign currency needed to pay for them has to be earned through exports. But we must examine how much of the present large and increasing imports are really necessary to meet the essential needs of our people. Import needs for this are not all that large and our traditional industries which, in any case, are our major foreign exchange earners have the capacity to earn enough to pay for such essential imports. The so-called modern industries like chemicals, electronics, engineering, etc, do not earn enough foreign exchange to pay even for their own imports. Their growth is one important reason for the unbridled growth of our imports.

The foreign exchange outgo on petroleum products came into the limelight recently. Actually, our own past policy of permitting unrestrained expansion of the automobile industry has been responsible in no small measure for that crisis.

Defence of the country requires import of a large variety of arms and equipment. It cannot be denied that in the present security

environment around our country security requirements cannot be ignored. But it is equally true that acquiring ever larger quantities of weapons does not necessarily enhance security; it merely leads to an arms race. Hence determined political efforts to relieve the security threats and at the same time to attain maximum possible self-reliance in military production need to be pursued to keep defence imports at a reasonable level.

The alternative development concept will, thus, not view exports as a holy cow. The effort will be to restrict imports to limits which our normal exports can sustain.

Technology is another holy cow in the present developmental discourse. I have already discussed it at some length earlier. If our production system is predominantly small- and medium-scale, decentralised and labour-intensive, its technology needs will be determined by this structure and will be well within our existing capabilities. Further development of technologies needed for improving such productive systems must and can be achieved. Such an effort, however, will aim not at labour saving but at higher all round productivity and self-reliance. It is worth remembering in this context that small industries already produce some 40 per cent of our total industrial output. Their share in total industrial exports is also about the same. Further, they have consistently maintained a significantly higher rate of growth of output compared with medium and large industries and that with little or no active support from the government. They provide employment to some 1.4 crore workers which is far greater than the employment in the large and medium industries. The total investment in this sector is also only a fraction of that in the organised sector.

FINANCIAL VS HUMAN CAPITAL

The present pattern of development creates ever increasing demand for energy. That energy has to be generated at exorbitant cost in capital and environmental pollution. A small-scale, simple technology, decentralised, labour-intensive productive system will drastically reduce the need for commercial energy and will also reduce the load on transport which is a significant consumer of energy. By proper cultivation of bio-fuels and their efficient use in the several models of smokeless 'choolhas' which are already developed, the domestic needs of energy especially in the rural areas, which are not very large in any case, can be met. Such commercial energy as will still be needed can be obtained by more efficient generation, transmission and utilisation of electricity and, more importantly, by purposeful development of renewable, non-conventional energy sources like the sun, wind, water, animals and biomass.

We are constantly told that our country is short of capital and must, therefore, depend upon foreign capital with all the strings that are attached to it. But this is the result of our opting for a highly capital-intensive productive system with the capital needed per unit of output going up continuously. This productive system is simply not viable or sustainable for a country like ours, perhaps for any country. The alternative labour-intensive system will make the goal of self-reliance in capital eminently attainable.

The science of economics recognises the importance of human capital. To a considerable extent, monetary capital and human capital are interchangeable. The mode of development set off by the industrial revolution continuously substitutes monetary capital for human capital through the adoption of ever new labour-saving technologies. But this process is not inexorable nor irreversible if there is the will to bring about a change. In the alternative development model, this process of labour-saving capital intensification will need to be firmly discouraged.

It may be argued that mere numbers do not constitute human capital. It is the knowledge and skills acquired by persons that turn into human capital. This is, no doubt, true. But it is equally true that artisans and craftsmen in our country do possess a store of knowledge and skills which are not to be scoffed at. These can be further enhanced and diversified by proper training and more people can be so trained. Our stock of human capital can thus be augmented and upgraded continuously at a cost which will be a fraction of that incurred in importing the latest technology and capital equipment.

All capital should be viewed as ultimately belonging to the society. Individual ownership of capital should not be allowed beyond a limit commensurate with the level of our economy as a whole. Deployment of all capital should follow priorities set down for the purpose by the society and not purely the market signals so that production to meet the real needs of the mass of people is ensured.

Thus, by opting for small-scale, labour-intensive, moderate technology, decentralised mode for industry and producing for the needs of the mass of our people we shall be able to integrate production and employment, greatly reduce the need for large imports and for scarce inputs like capital, energy, transport and high technology. Such a system will also stimulate growth by redistributing incomes through broad-based employment generation.

ROLES OF MARKET AND STATE

What will be the place of the market in the developmental paradigms sketched here? Will it amount to adoption of a 'command economy' dominated by controls, licences

and quotas? It should be clear that a small-scale, labour-intensive, decentralised model of production for the people cannot, by its very nature, be a command economy model. Even such a system can, no doubt, be hamstrung and distorted by an overbearing bureaucracy or by self-seeking politicians in power. This will need to be guarded against by vesting in the people themselves the function of planning investment, production, distribution, infrastructure development and so on. Unrestrained access to information about whatever is being done in their area in the name of development must also be guaranteed to people to enable them to keep a direct and continuous check on excessive bureaucratisation, corruption and ecological damage or loss of natural resources. An open market will clearly be a part of such a system.

But a free global market of the kind favoured by the so-called mainstream economics of the day will not allow the kind of development we are talking about. International finance capital, MNCs and their Indian surrogates, stock market racketeers, smugglers and such others will hold our economy to ransom and exploit our people and resources for their own enrichment. That kind of a free market is, in fact, not free at all, and will need to be firmly regulated.

THE STATE

What will be the role of the state in this kind of developmental paradigm? The affluent classes, the elites or the creamy layer of today, which may include the upper middle class and even a part of the industrial working class, who have enjoyed the benefits of the present development, will strongly oppose the dismantling of this model in favour of a redefined one. This class has power, money and international bodies like the World Bank, IMF and the World Trade Organisation on its side. Any drastic change from the present model will not be a painless process. The primary sanction behind such a change will obviously have to be the people's will. But that alone will not be enough. When the chips are really down, the state will have a decisive political and economic role to play. The state alone can effectively overcome the opposition of those who have a vested interest in the present order of things, and can facilitate an orderly change to the new order. In the redefined model, planning and the 'commanding heights' concept, no matter how hackneyed it may be made to sound today, will be crucial. As such, in the redefined developmental paradigm the state will have a decisive role to play, but it will need to have the sanction of the people's will behind it.

[This paper is the text of the author's GR Bhatkal Centenary Lecture delivered under the auspices of the Asiatic Society, Mumbai, on September 23, 1996.]

Development! Just Going Round in Circles?

Sunil Ray

Reviving a Rural Industry – Silk Producers and Officials in India and Bangladesh, 1880s to 1980s by William Van Schendel; University Press, Dhaka University, Dhaka, 1995; pp 249, Tk 275.

HISTORICALLY speaking, the state as an agency of development has perceived its role necessarily at the behest of politics of power, ever since it emerged as an institution. Any political formation in power that would like to make a niche for itself in a state-supported development programme has to be compatible with its bureaucracy. Some call this phenomenon 'politics of survival'. This politics of survival, depending on authoritarianism and bureaucracy, has a tendency to increase its hold over society, which is ostensibly non-political. In Lesotho, in Africa, the 'development industry', is closely involved with the state bureaucracy, a machine for reinforcing and expanding the exercise of bureaucratic state power and, hence, has failed to eliminate poverty. Poverty was the point of entry of the state bureaucracy to launch an intervention that finally yielded no desirable impact [Ferguson 1990].

Rural industrialisation is one such development programme of the third world countries, which is taken up by the state when its survival is threatened, especially when these countries are under 'structural adjustment programme'. The programme is then projected as a major source of generation of employment and income for the unemployed and the underemployed in the countryside. Its potential as a means of employment and income generation in rural areas is high. But, the state, willy-nilly, remains oblivious of the material conditions, and the conflicts and tensions engendered when the country passes through the process of inter-action with international monopoly capital.

The state hardly pays heed to the historicity of social formation, embedded in the sociology of rural entrepreneurs of 'Darwinian varieties'.¹ In the process of interaction of the social formation of those Darwinian varieties with the development programmes of the government, carried out with a 'top-down' approach, the household mode of production is weakened, but not destroyed. As a result, rural industrialisation of all the states in the third world is trapped in the same cycle of reproduction and gains legitimacy by and through its logic. Techno-organisationally, rural industry remains a segmented part of production. In the context

of increasing commodification, the gulf between the spirit of the programme as conceived, and the rhythm of the changing socio-economic relations is noticeably large. The more authoritarian the state, the wider is this gulf.

The book under review exposes the limitations of the state being a development agent, dispels bureaucratic incapacity and analyses the development game plan of the state while playing politics of survival. The author has taken silk industry as a case and analysed silk production between the 1880s and the 1980s, in a silk region of central Bengal, now divided between India and Bangladesh. The book runs into eleven chapters, in three parts.

In Part I, the author has traced the historical forces and shown how the once growing silk industry of Bengal was forced into the process of marginalisation by the colonial powers. He has also drawn a parallel between the attitude of the government during the post-colonial period and that of the colonial government towards the development of the industry. Part II, subtitled 'A view from the below', explores the areas of conflict and convergence of social formation the silk industry is embedded in, in the context of changing social and economic circumstances. Part III captures the missing links in the so-called development process.

While outlining the conceptual framework of the study, the author goes deep into the historical background of silk production in the region. What is revealing is that the position of Bengal, which at one time was a pre-eminent silk exporter of south Asia, has slid down today so much that it is a mere shadow of its former self. The market conditions changed owing to the expansion of capitalism into world economy. This led to the emergence of a unified market for silk. The development of technologically sophisticated silk industries in western Europe during the 18th century, turned Bengal into a raw silk exporter from an exporter of silk textiles. Silk filatures, in which silk is machine-reeled, were installed in order to cater to the emerging demand. Gradually, and steadily, Bengal turned into an exporter of raw silk. Resultantly, the agro-industrial linkages, which formed a

natural integration between mulberry cultivation, raw silk production, and weaving at the household level, was severed.

With the advent of international capitalism, silk processing was restructured; but, silk production was left unstructured with the traditional households with abundant cheap labour. Textile production was taken over by the highly capital-intensive industry in Europe. The link with international capitalism buttressed home-based production and obstructed other forms of production such as that among the silk-producing peasants in Bengal to expand. Sen's thesis makes a similar observation, though in the wider politico-historical context of colonial India. He observes that colonial penetration into undivided India arrested the evolutionary process of the then existing forms of production, which were growing on their own. Before the process could take off, British capital stepped in [Sen 1982].

The collapse of the Bengal silk industry being an outcome of international capitalism, historically speaking, is indisputable. But, what is worse is the policy-makers in the post-colonial era re-inventing the importance of agriculture-based rural industrialisation such as the silk industry as a means to reduce the incidence of under-employment and unemployment in rural India. Such a blunder on the part of the policy-makers continues because, as the author points out, policies in the post-colonial period are formulated in the light of the management ethos of the colonial government. For instance, policies are geared to hoisting cocoon production, improving silk quality, prevention of losses resulting from silk worm diseases, etc. These, no doubt, are important. But, while formulating policies, one has to bear in mind the ground realities in which silk production is taken up, and the changes undergone over the years. For instance, the conditions under which rural households shift family labour and resources from agriculture to industry, and vice versa as well as the relative opportunity cost of labour or resources in silk as compared to other activities affecting long-term social and demographic changes, today are different from what they were during the pre-colonial period.

The bureaucratic approach of the government belittling social processes in its policies in the context of silk and silk products in Bengal is similar to the improvement of wool production in the state of Rajasthan. The government of Rajasthan has been trying to improve production of wool as well as its quality by means of incorporating exotic breeds into the native sheep breeds through its hybridisation programme. The story is in

no way different from that of the silk bureaucracy. It is 'typically' a management-oriented programme, divorced from social processes. As a result, notwithstanding the continued efforts made by the government for more than two decades, the programme still remains peripheral to the rearers' economy [Ray 1995].

On the question of Bengal being turned into an exporter of raw silk instead of finished products, the author has left a few questions unanswered. It is true that home-based activities were victims of the onslaught of international monopoly capital; but then, raw silk processing (filature) was left by the East India Company to the private sector. It was done at a time when Japan entered the international market with improved technologies. Why did the private sector in the silk industry of Bengal fail to reap the benefits of competition through improving its technologies? The government's apathy towards the development of the silk industry is said to be the reason for this. However, when Japan went in for restructuring its domestic silk production and setting up a strict quality control mechanism to take full advantage of the collapse of European sericulture during that time, why did the private entrepreneurs of Bengal fail to do the same? How did the apathetic attitude of the colonial government serve its interests? The author has not probed these issues.

Even in the post-colonial period, Bengal sericulture has failed to learn from the other parts of the country like Karnataka, Tamil Nadu, etc. Chapter III shows how government intervention in the exploitative marketing network, and its restructuring have boosted silk industry in Karnataka. The traditional marketing network dominated by the middleman has been replaced by an organised marketing system, in which grading, sorting, etc. have been introduced. The middleman has virtually been eliminated.

In Bengal, marketing of cocoons and raw silk continues to be a serious bottleneck. Co-operatives were formed without lasting success, and, more importantly, no attempt has been made yet to weed out the middleman. Merchant capital continues to exercise control over production, marketing, pricing, etc. Through a system of intermediaries, the merchants corner maximum benefits of the trade. Whatever is finally left to the actual producers, is used for perpetuation of the activities, but without prosperity [Ray 1995]. The author shows how higher prices accrue to the producers wherever the government has set up a parallel marketing network, as in the case of the regulated cocoon market in Karnataka. In Bengal, no concerted efforts have been made to eliminate middlemen, and bureaucratic and technocratic approaches continue to be

followed towards the development of sericulture.

The story of Bangladesh is in no way different from that of Bengal. The new nation faced severe scarcity of skilled silk labour due to migration of rearers, reelers, and weavers who happened to be Hindus, to West Bengal. Besides, foreign funds which Bangladesh received liberally to develop sericulture, were spent on the expansion of the bureaucracy. NGOs do not seem to have brought about any perceptible change in sericulture.

The bureaucratic 'putting out' system was introduced in Bangladesh. Silk producers would collect silk worm eggs (seeds) from the Bangladesh Sericulture Board (BSB), and sell the cocoons to the Rajshahi Silk Factory, whose viability has been ensured mainly through subsidy. The seeds, of course, are of good quality, but the returns to the rearers is low. More significantly, there is no economic freedom for the silk producers. However, producers in Bengal carry out silk-related activities within a system of petty commodity production. Trade is regulated by private traders in an imperfect market; cocoon dealers and silk reelers collude to keep cocoon prices low. In this case too, rearers do not enjoy economic freedom. However, their position, relatively speaking, is not, as the author argues, as bad as that of their counterparts in Bangladesh. The rate of return for the cocoon producers is higher, and the economic freedom enjoyed by them is relatively more. But, the aggregate benefits that accrue to them get wiped out eventually due to the harsh economic environment.

The state has a few lessons to draw from both the situations. The state should break the exploitative system which merchant capital has set up to perpetuate its commanding position in the sphere of exchange. It also should minimise bureaucratic control. Evidence suggests that petty commodity production can progress through the process of capital accumulation [Ray 1991], provided it operates in a competitive situation that does not allow the prevalence of the putting out or the intermediary system.

In the Mexican context, it was observed that proliferation of labour-intensive petty commodity production took place along with growing capital intensification [Cook 1984]. However, in a situation where production relations are typified by Bhaduri's land-tenant relationship [Bhaduri 1973], or Ray's middleman-merchant and wool producers relationship [Ray 1995], tenants or wool producers will never be allowed to earn more than what is required for their bare subsistence. The production relation of the silk weavers who are working in the 'putting out' network [Banerjee 1995] do not seem to be different.

The basic problem, as the author has explained in Chapter 7, is that the production relation continues to exist on both sides of the 'Padda' (river 'Padma') without any transformation. The community production continues to be 'familised' in that silk production neither provides a spring-board for further rural industrialisation, nor has declined to that of rural proletariat. The condition of many artisan-based industries in the rural areas is similar to that of silk production. The law of their reproduction is 'involutionary commercialisation' that increases employment without adding to productivity and income. This involutionary commercialisation is continuously supported by 'familisation' of the household mode of production. The gender, kinship and demographic changes take place at the household level in response to the commercialisation or changing market conditions.

Farmers adopt different strategies to cope with the market conditions, depending upon their command over resources such as land, capital, water, etc. The most rewarding strategy for the farmers has been cultivation of labour-intensive cash crops. However, only those who have good quality land and initial capital can respond to market demand for agricultural produce. The production strategy for the other group of farmers, who are small and marginal, has been to complement agriculture with non-agricultural production or trade. These have very little command over the resources, but have full command over their inherited skills, which they use as their main resource while adopting production strategies for silk production. The division of household labour between agriculture and silk production in such cases is determined by the relative opportunity cost of various agricultural and non-agricultural activities. A third production strategy is followed by those who have command over neither resources nor skill. They are domestic or agricultural labourers, and respond to the changing conditions of the labour market.

The 'internal' need to reproduce rural household enterprises in the commodity production system being dependent upon household labour is increasingly being realised by the petty producers. This internal factor, accompanied by external factors such as improving health services, lower mortality rate, etc. has led to population increase at a remarkable pace. The incidence of population increase is relatively higher in the case of the rural household enterprises, and has significantly contributed to petty commodity production. It is true that production has steadily expanded; but, such expansion, as mentioned earlier, is involutionary. The population increase among rural producers being locked into familised commodity production, has led to involutionary growth.

As a result, poverty has worsened, vulnerability has grown and social inequality has deepened.

The author has raised a fundamental issue at the end of the book on the relevance of the state to development, which has been debated at length [Banerjee 1995]. As the author observes, the state, as an institution, is increasingly coming under attack since its coherence and accountability have diminished due to the involvement of political leaders in the 'politics of survival'.

Development programmes are crucial pawns in power struggles within the state organisation: state institutions parade their programmes in order to demonstrate how indispensable they are, how well they function as career machines, and how essential it is for them to expand further. This jockeying for position within the state is all the more important when state leaders, involved in their own 'politics of survival' diminish the coherence and accountability of the state and its agencies in order to safeguard their personal political survival, which often takes precedence over efficient administration (p 217).

A 'new' paradigm of development economics based on local organisations and institutions is gradually emerging and assuming greater significance in the development discourse [Nugent 1993; De Janvry et al 1993; Thorbeck 1993; Uphoff 1993]. However, they could be significant in the development discourse only when they make themselves accountable to the people they work for.

Although they are committed to the demolition of authoritarian developmentism, their initial enthusiasm fades when they are caught up in what is called an 'environment of conflicts'. In such a situation, when institutions like NGOs receive development aid from foreign countries, they seem to be more accountable to the bureaucracy of their own organisations than to the people. NGOs engaged in the task of developing sericulture could not do much with the development aid received from foreign countries. On the contrary, such aid, as the author explains, has escalated a new power struggle between the state and NGOs in an attempt to establish control over such 'environment of conflict'. However, the concept of 'environment of conflict' needs further elaboration in the present context. Its implications to politics of development might provide insights into the ongoing development discourse.

Whether the state or the local institutions such as NGOs could eventually establish control over such 'environment of conflict' is left at the moment for the future to decide. But, while giving sanction to the politics of survival, and adopting the guardianship model of development, the state is certainly becoming weaker as a development agent. The states under study have a history of 100

years of great social upheavals. But, how meaningful such social upheavals and historic changes are to rural markets and silk industries, and to rural development in general, is doubtful. The solution lies, as the author visualises, in establishing direct contact between the state and the producers; for this, pressure by the stakeholders needs to be built up. Until that time, development is what the silk worm rearers remark: "where is that development they talk about so much, we are like silk worm ourselves... just going round in circles" (p 226).

The book is analytically rich. It convincingly articulates the development conflicts. However, it would have been rewarding for the readers if more analytical content had gone into the discussion of silk processing. The book is useful to researchers and, even more, to governments.

Pre-Capitalist Markets

Kanakalatha Mukund

Money and the Market in India 1100-1700 edited by Sanjay Subrahmanyam; Oxford University Press, Delhi, 1994; pp ix+316, Rs 300.

AS an economic historian I am constantly amazed at how facilely most economists equate 'markets' with modern economies and, concomitantly, 'pre-modern' with subsistence production and non-monetised exchange. Equally, most people think that administered prices and markets are the by-products of modern planned economies, without realising that anthropologists like Karl Polanyi have theorised about the existence of administered markets even during the ancient period. This book under review would be a useful corrective to such ahistorical perspectives, recreating as it does the relationship between money supply, market behaviour and the state in medieval India, ranging from the Chola period down to the Mughal empire.

Kenneth Hall's essay on the Chola heartland is the only paper in the book on south India and is based on information from temple inscriptions. Hall's major conclusion that the economy of south India

was characterised by a spatial and functional hierarchy of markets, with the urban market town ('nagaram') at the apex of the structure is generally widely accepted, with minor criticisms. But Hall's argument that the administrative assemblies of the 'nagaram' also regulated prices extensively seems more suspect. This is based on the fact that values of donations to the temple (equivalents for cows, sheep, etc) or of items used in endowed services do not indicate any variations. As a corollary, Hall has also noted that most exchange values are mentioned in terms of paddy equivalents. The questions which such conclusions raise are: How could local institutions determine prices uniformly over a large region? Could even 'administered' prices continue unchanged over several centuries? If exchange was based on paddy, what was the role of money in the economy? (It may be mentioned here that the inscriptions do mention a wide variety of gold coins like

'kasu', 'ilakkasu', 'tulaippon', etc, which were evidently in use.)

This underscores a fundamental methodological problem in historical analysis, which the editor also indicates in his Introduction. Obviously, quantitative data are not available in sufficient quantity for conclusive statistical analysis in pre-modern India, and the data become more random as we go further back in history. The historian draws inferences from this evidence, on the basic assumption that the figures can be taken to indicate representative trends, when not contradicted by other information. This can always be questioned and debated, which may not lead to any definitive conclusions in any case. Most of the papers in this volume, devoted to north India, in fact initiate precisely such debates, questioning earlier historical writing.

Two more papers in the volume also emphasise the extent of state intervention in the economy. The most interesting aspect of both is the fine appreciation shown by the rulers, more than 500 years ago, of the economic links between the prices of foodgrains, general prices and power structures. Alauddin Khilji, recorded a contemporary historian (Zia' Barani), had instituted a series of measures to control prices, especially in Delhi. Though most historians have discounted his work, Habib argues that the facts recorded are accurate and also present the rationalisation for such measures by the king – namely, to make it possible to raise a large army when his kingdom was threatened by Mongol invasions. J F Richards similarly looks at the economy during the rule of Ibrahim Lodi. Contemporary histories again talk of the extraordinarily low level of prices during this period, which has led most historians to infer that this was due to a severe shortage of specie. Richards questions this assumption and demonstrates that the phenomenon of low prices was the result of a deliberate ploy by Ibrahim Lodi to undermine the power of his nobles. The sultan thus ordered that the land revenue, in a year of abundant harvests, should be collected only in kind, which left the revenue assignees with vast quantities of grain which they were forced to sell at very low prices. Habib's arguments leave us with the same question as Hall's conclusions. Did the medieval state have the administrative capacity to regulate prices on such a wide-ranging scale?

Aziza Hasan's paper on currency output and prices in Mughal India in the 17th century has triggered off a major debate among historians working on the period. Hasan has extended to Mughal India

Earl Hamilton's hypothesis of a 'price revolution' or general inflation in 16th century Europe due to the steady inflow of American silver. Hasan's argument, espoused in general by the 'Aligarh school', has three propositions. One, due to the influx of a large volume of American silver into Mughal India in the first quarter of the 17th century, there was a corresponding sharp increase in the volume of silver rupees minted; two, after this tapered off, the expansion of European demand for various products of India (textiles, indigo, etc) led to another influx of silver after 1685 originating from Europe; and, three, this resulted in a noticeable price increase in Mughal India. In the ensuing debate, three kinds of criticisms have emerged – about Hasan's use of museum collections of coins as representing coin output, the assumption that bullion inflows came mainly from America via Europe and, most importantly, the assumption that prices recorded for three points of time represent a trend. Subrahmanyam puts together a review of the literature on this question with an outline of the theoretical basis of monetary analysis and a comparison with the experience of west Asia for the same period.

The main interest of B R Grover's paper is his extensive use of non-European, local language sources to analyse the economy of north India, the links between the rural and urban sectors, the patterns of markets, commerce and production. His treatment of the time span of 200 years as an undifferentiated period and his strong preference for a totally descriptive reconstruction which misses the analytical implications of his own observations diminish the value of his work. K N Chaudhuri presents a useful macro-level study of markets and their functioning in

India, and basically argues that the institutional character of Asian markets was not significantly different from that of Europe in the pre-modern period. Frank Perlin criticises the general tendency among historians to see marked discontinuities in post-Mughal Indian history and stresses the continuities and the development of other financial institutions in response to the changing political scenario in the 18th century.

Sanjay Subrahmanyam's Introduction is a scholar's delight. It gives a synthesis of all the pieces included in this volume, preceded by a general discussion on the theories of pre-capitalist markets, a critical evaluation of the existing historiography on the nature of Mughal state and its revenue system and a sketch of the general works on monetary history of India. He also includes, not very convincingly, a brief discussion on social value systems and attitudes to money by referring to early and late medieval literature, poetry, etc.

While the book shows a high quality of scholarship, it also displays very poor production quality. The standard of proof-reading is quite abysmal, and we have gems like, 'pears' were being exported from the Coromandel (p 58) or, in Subrahmanyam's own article, that the silver equivalent of two to four million rupees was 25.6 to 51.2 million tonnes (p 200). Many more can be listed. More seriously, maps which are referred to in the text are non-existent (see Deyell's paper) and figures are printed without numbers (Hasan's article). At the academic level, because of the attention to thematic unity and careful selection, the book is interesting and insightful, and most important, it manages to avoid the extreme unevenness of quality which marks most books of collected papers.

Industry, Finance and Employment

A Discordant Trinity

Ranjit Sau

The rich industrial countries of the OECD are having a profound technological revolution spearheaded by computer and a host of other marvels of science. Stock markets are booming; corporate profits are at an all-time high. But wages are falling; job insecurity is pervasive; and social tensions are mounting.

Our paradigm uses the non-linear Polya process to represent the ongoing increasing returns, in contrast to the traditional idea of diminishing returns. It is a world of multiple equilibria, instability, unpredictability, and the possibility of getting locked-in to an inferior equilibrium. In this milieu we portray the current scene as one of contradictions between 'industry' and 'finance': the former presses for output growth, the latter insists on zero-inflation. Evidently, labour is the worst loser in this battle royal.

The central banks of OECD countries are sacrificing millions of workers and trillions of dollars of output at the altar of the pseudo-icon, namely, zero-inflation. This pursuit, if continued, would cost 7 per cent of GDP, that is, some five millions of jobs, in the US alone. Will the US pay this high a price for price stability?

BY one reckoning the golden age of capitalism came to an end three decades ago. What followed is not very clear yet. Certainly not diamond, or platinum. Maybe, it is a silicon age, named after the material of tiny chips in computer that is changing the way we live.

"The world may be moving inexorably toward one of those tragic moments", writes Kapstein (1996:18), "that will lead future historians to ask, why was nothing done in time?" The globalising economy is leaving millions of disaffected workers by the way side. Unemployment, inequality, insecurity, and poverty have become its handmaidens. Rapid technological change and international competition are fraying the job markets of major industrial countries. At the same time, systemic pressures are curtailing the government's initiatives. Just when the citizens need the nation-state as a buffer from the world economy, it is abandoning them. With this perception Kapstein asks: "Were the economic policy elites unaware of the profound disruption that economic and technological changes were causing working men and women? What prevented them from taking the steps necessary to prevent a global social crisis?"

The current predicament is hardly unprecedented. About this time, 100 years ago, the steam engine and telegraph were making a very similar explosion in trade and commerce. During the 19th century the world enjoyed a burst in production and investment. But severe dislocation accompanied that process of globalisation, and eventually contributed to its undoing.

The present essay is motivated by such concerns; but it has a fairly modest agenda. One has to interpret the object before one

can think of changing it. So we begin at the beginning, and make an attempt to understand what is happening. The gist of our search is as follows. In contrast to the Victorian image of an optimising, stable, and genteel economy in equilibrium under the law of diminishing returns, we recognise that some industries, at the moment hi-techs, for example, display increasing returns with Schumpeterian innovations which, in turn, kick up asset bubbles. With the arrival of computers and the associated information technology (IT) a major transformation is under way since the 1970s. It is polarising the distribution of income and wealth. The consumption propensity of the impoverished, we know, is close to one. And so is that of the rich as well; for they have amassed vast amounts of wealth through industry and finance. The Pigou effect bears down upon those affluent consumers and keep up their budget lines high—conspicuous of otherwise. As a result the rate of saving is low and falling. Hence the multiplier (the reciprocal of the propensity to save) has risen with the effect that the inflation-impact of autonomous expenditures like investment and export is going up.

Meanwhile, in the wake of sustained growth during the earlier decades a powerful financial-rentier class has taken shape. Owners of paper-wealth dislike inflation most; and they have been persuaded by a theory that certain amount of unemployment is essential for keeping prices steady. Accordingly, zero-inflation has become the sole target of policy-makers. With the slightest hint of inflation deflationary measures like raising interest rates are adopted. That hurts the real investment, and a series of consequences follows. With

relatively meagre capital accumulation the potential output of the economy decelerates, and the rate of unemployment rises even in the long run. Herein resides the seed of internal contradictions of the system. This story, to be sure, relates immediately to the US at present times; and seems amenable to generalisation for world capitalism as a whole.

A NEW PARADIGM

The history of the development of IT infrastructure began in the early 1960s and evolved in three stages. First, during the data processing era of 1960-80 the focus was on automating manual transaction-processing jobs. Second, during the micro-computer era of 1980-95 the emphasis shifted to enhancing professional functions such as engineering, financial analysis, and management. Finally, the emerging network era (from about 1990, overlapping with the preceding one) is a consequence of fusing of computer with telecommunications technology. Inter-firm integration of these technologies allows for a new firm structure, known as the IT-enabled network, more suited to competition in the global marketplace.

The computer's debut into business was a non-event of the 1960s, and remained so for more than a decade. Because mechanical punch-card equipment of the period looked so much like any other capital-based technology designed to automate production, business organisations were inclined to treat IT as a specialised form of capital rather than a new factor of production, which it was. Computers were first applied to the automation of low-level, routine work of

accounting departments; then they spread to the areas of purchasing, inventory control, and management of manufacturing processes. A critical mass of capability and experience was reached by the mid-1970s. The subsequent developments have been phenomenal in both quantity and quality. Meanwhile, due to inertia, oversight, and evasion by the management a sizeable amount of slack in manpower had piled up in business, which could no longer be borne under the threat of global competition. In time the crunch came. "To align a firm's structure for carrying out work so that the information technology that it has assembled over the years can be leveraged", conclude Nolan and Croson (1995:25), "a firm must be prepared to downsize forcefully and painfully". As for the order of magnitude of the required labour-shedding they consider as reasonable a "commitment to eliminate upward of 50 per cent of the workforce while maintaining current levels [of revenue]". This is, indeed, a breathtaking episode of creative destruction whose sheer magnitude would have overwhelmed even Schumpeter. While the actual extent of retrenchment and layoff on account of technological updating *per se* is hard to measure, the enormity of the impact is beyond any doubt. In 1993, large US companies announced nearly 0.6 million layoffs, which is 25 per cent more than were carried out in 1992, and nearly 10 per cent more than in 1991 [Hamel and Prahalad 1994:124]. The casualty estimates of downsizing vary widely, ranging from the conservative figure of 3.1 million publicly announced layoffs since 1989 to the much-debated *New York Times* tally of 21.2 million in the same period.

Not just the computer-driven IT, but a wide range of knowledge-based hi-tech industries have sprung up in pharmaceuticals, aircraft, missiles, telecommunication equipment, bio-engineered drugs, and the like. The products are complicated to design and fabricate. They are intensive in know-how and light on resources. Hence they typically have R and D costs that are large relative to their unit production costs. "The first disk of Windows to go out the door cost Microsoft \$50 million; the second and subsequent disks cost \$3. Unit costs fall as sales increase" [Arthur 1996:103]. This is the essence of increasing returns.

The increasing-returns world of hi-tech products is not yet common in the economics literature. It does not sit well in the models of Walras or Marshall. Appropriate mathematical apparatus was not available in their days; the non-linear random process theory did not exist at that time. That situation has now changed. In 1931 mathematician George Polya took the first step, which remained obscure till 1980 when probability-theorists Bruce Hill, David Lane, and William

Sudderth solved a more general non-linear problem. The next breakthrough came in 1983 as a result of a joint project of Brian Arthur, Yuri Ermoliev, and Yuri Kaniovski. The theory of increasing returns is new, but it is well established, and most relevant. Now we know that the hallmarks of increasing returns are: market instability (the market tilts in favour of a product that gets ahead), multiple potential outcomes (non-ergodicity or path dependence), unpredictability, the possible predominance of an inferior product, and fat profits for the winner.¹

We follow Arthur (1994) to illustrate the non-linear Polya process in this context. Suppose that H hi-tech companies are trying to build up their respective market shares. In order to introduce the phenomenon of increasing returns assume that a unit addition of sales revenue is made to one of H companies each time, with probabilities that are a function of the proportion of units currently in the H categories. Time here is event time, not clock time. Thus the next unit of sales is added to company i with probability $p_i(x)$ where x is the vector of current proportions, that is, market shares. The vector of probabilities $p = [p_1(x), \dots, p_H(x)]$ is a function that maps the unit simplex of proportions into the unit simplex of probabilities. The question is: how market shares of these companies, or equivalently the numbers or proportions in each category, build up. What happens to the long-run proportions in such a system? What limiting steady-states can emerge?

The process starts at time 1, with an initial vector of companywise allocations of total sales revenue denoted by q . Let y_t be a vector that describes the number of units in companies 1 through H at time t , when $\{q+(t-1)\}$ units of sales in total have been allocated. Let b_j be the j -th unit vector with probability $p_j(x)$. Then,

$$(1) \quad y_{t+1} = y_t + b(x)$$

By definition, we have, $x_t = y_t/(q+t-1)$, and $x_{t+1} = y_{t+1}/(q+t)$. Dividing eqn (1) by total

units $(q+t)$, we find that the vector of proportions of companies 1 through H , that is, their market shares, evolves as follows.

$$(2) \quad X_{t+1} = x_t + [b(x_t) - x_t]/(q+t)$$

Eqn (2) can be rewritten in the form

$$(3) \quad X_{t+1} = x_t + [p(x_t) - x_t]/(q+t) + \theta(x_t)/(q+t).$$

Here θ is defined as the random vector.

$$(4) \quad \theta(x_t) = b(x_t) - p(x_t), \text{ with } E(\theta|x_t) = 0.$$

The dynamics of the companies' market shares is governed by the stochastic difference eqn (3). The conditional expectation of θ with respect to the current state x_t is zero. Thus (3) and (4) yield

$$(5) \quad E(x_{t+1}|x_t) - x_t = [p(x_t) - x_t]/(q+t)$$

Eqn (5) shows that if the probability $p_i(x)$ of an addition to company j is greater than the current proportion $x_j(t)$ for company j , then this company's market share would rise. Conversely, if the probability is less than the current proportion, it would decrease.

Depending upon the function p , there may be several points x (several patterns of market shares) at which the deterministic motion as of (5) is zero. These are the fixed points of p , where $p(x) = x$. Some of these are attractor or stable points, while others are repellant

TABLE 2 RATE OF SAVING IN THE US

Year	Gross Saving as a Per Cent of GNP	Personal Saving as a Per Cent of Disposable Personal Income
1960	21.5	6.4
1965	22.2	7.6
1970	19.0	8.4
1975	18.1	9.0
1980	19.4	8.2
1985	17.8	6.9
1990	15.7	5.0
1991	15.8	5.7
1992	14.5	5.9
1993	14.3	4.5
1994	15.3	3.8

or unstable points. Figure 1 depicts the case of dimension $H=2$, where A, C, E are stable points, and B, D are unstable.

The economy that we visualise has two sectors: one obeys the law of diminishing returns, the other exhibits increasing returns. The former consists of bulk production: of coal, lumber, heavy chemicals, soybeans, coffee, metal ores, pig iron – commodities heavy on resources, light on know-how. Marshall analysed their market, in competitive equilibrium, that fitted beautifully with the Victorian values of his time. By contrast, the increasing-returns sector of modern industries is knowledge-intensive and extremely dynamic. The two sectors are not neatly split. Hewlett-Packard, for example, designs knowledge-based devices in Palo Alto, and manufactures them in Corvallis, or Greeley. Most hi-tech companies have both knowledge-based operations and bulk-processing operations. But because the rules of the game differ for each, companies often separate them. Conversely, manufacturing companies have operations such as logistics, branding, marketing, and distribution which belong largely to the knowledge world. And some products – like the personal computer – start in the increasing-returns world, but later in their life cycle become virtual commodities that belong to Marshall's processing world.

To survive and thrive in such an economy it is not enough for a firm to achieve competitiveness in the price/performance attributes of current products alone. The survivors of the first wave of global competition, Western and Japanese alike, are all converging on similar and formidable standards for product cost and quality. In the long run, competitiveness derives from an ability to build, at lower cost and more speedily than competitors, a well-integrated complex of production skills and streams of technologies, collectively known in the business literature as the "core competency" [Prahalad and Hamel 1990:82]. At least three tests can be applied to identify core competencies in a company. First, a core competence provides potential access to a wide variety of new and emerging markets. Second, a core competence should make a significant contribution to the perceived customer benefits of the end product. Finally, a core competence should be difficult for competitors to imitate. And it will be difficult if it is a complex harmonisation of individual technologies and production skills. A rival might acquire some of the technologies that comprise the core competence, but to duplicate the comprehensive pattern of internal co-ordination and learning is not an easy task. The diversified corporation, in this milieu, is comparable to a large tree. The trunk and major limbs are core products, the smaller branches are business units; the

leaves, flowers and fruits are end products. The root system that provides nourishment, sustenance and stability is the core competence. Such a company is well-focused, not diffused. The wave of reorganisation, restructuring, merger and acquisition, spin-off, and divestiture that is currently sweeping the US runs counter to the doctrine of massive diversification that prevailed in the preceding decades. And it seems to be driven by this theory of core competency. No doubt, it spawns increasing returns.

At another level the economy may be considered to have two segments, namely, 'industry' and 'finance' [Keynes 1930:42-43, 217-30]. The former constitutes the so-called 'real' economy that produces goods and services, while the latter deals with financial assets such as money, bonds, stocks, and derivatives. Like industry, finance also can generate increasing returns with all the consequences of multiple equilibria, contingent selection, chaos, or persistent disequilibrium.²

It is not conceptually easy to move from this two-by-two classification (industry/finance, and diminishing/increasing returns) to the plane of an aggregative macro-economics, or vice versa. However, the circle of the story can be completed as follows. Core competencies of the firms emerge from innovations that create new products, processes, consumer preferences and markets. At this phase the firms enjoy increasing returns. Financial markets respond with enthusiasm; asset bubbles are formed. The market equilibrium is not necessarily unique, nor is it stable, let alone optimality in any sense. In due course the Schumpeterian novelties pass into Marshallian commodities, and the cycle ends often with a financial crisis *à la* Minsky. What is most noteworthy is that despite all these thorough-going micro-economic changes the macro-economy may well stagnate in terms of aggregate employment and output, if the boom in income and wealth fails to translate into higher saving and investment. In fact, this may well be an apt description of the present reality.

POLICY PARALYSIS

Between 1971 and 1978, the G-7 economies enjoyed an annual growth rate of 3.5 per cent, and this happened even during a period of severe oil shocks, with the consequent rise in energy prices and inflation. Since 1989, by contrast, growth has averaged 2.1 per cent. For Japan the drop has been even sharper – from 4.5 per cent during 1971-78 to a mere 2.4 per cent in the 1990s. Meanwhile, between 1979 and 1994 unemployment in the OECD rose from 5.1 per cent to as much as 8 per cent.

In western Europe the unemployment figures are frightening. During 1969-73 France had unemployment at the rate of 2.6

FIGURE 1: NON-LINEAR POLYA PROCESS

Probability of adding the revenue to company 1

per cent; today it is 11 per cent. Germany witnessed a jump from below 1 per cent to 10 per cent now. The Europeans have created a lost generation of workers, and are suffering from it in terms of increased crime, drug abuse, violence against immigrants, and the increasing popularity of extremist political groups.

As for the causes of this malady the OECD (1994) observes: "[M]uch unemployment is the unfortunate result of societies' failure to adapt to a world of rapid change and intensified global competition. Rules and regulations, practices and policies, and institutions designed for an earlier era have resulted in labour markets that are too inflexible for today's world." Thus, the blame goes to the so-called rigidity in the labour market. Krugman (1994) expresses a similar view: labour market "distortions" create a floor on real wages, and unemployment rises when the equilibrium wages fall below it.

The US is cited as the prime example of wage flexibility and full employment. There is an element of illusion here. The official data on unemployment are somewhat misleading in that they do not recognise what is known as 'disguised unemployment'. Eatwell (1995: Table 12) has estimated that, in 1990, the size of disguised unemployment in the US and UK was as large as the officially reported 'open' unemployment. In a sense, then, the 'true' unemployment is twice the published numbers. In this respect Japan has the worst case where the disguised unemployment is eight times the officially counted figure of unemployment. The next is Canada with the disguised unemployment of nearly three times the size of the recorded unemployment. France, Germany, and Italy also have disguised unemployment, but of relatively smaller magnitude.

Interesting as this exercise is, the methodology of Eatwell leaves much to be desired. He takes the sectoral average product of labour as the criterion, and the

manufacturing industry as the point of reference. "Disguised unemployment is defined as employment in very low productivity sectors. As a rule of thumb, 'very low' is defined as being a level of output per head less than 80 per cent of output per head in manufacturing" [Eatwell 1995:25]. This, in our view, is ad hoc and arbitrary. It may be devoid of any significance. An economy does not tend to equalise the average product of labour across sectors which may have different degrees of capital intensity. Rather, one might expect equalisation of the marginal product of labour. Put another way, one can see disguised unemployment in the Eatwell sense even when there is excess demand for goods in a competitive economy.

All the same, Eatwell's resurrection of the concept of disguised unemployment, introduced way back in 1937 by Joan Robinson to describe the situation in Britain then reeling under the Great Depression, is timely and illuminating. Keeping the basic issue in view, one can try an alternative route for measurement, namely, defining disguised unemployment as the sum of (a) persons working part-time because full-time work is not available, and (b) the so-called 'discouraged' workers who have searched, in vain, for job in the past 12 months and been available for work, but not working, and dropped out of the labour force in disappointment. This procedure draws upon the pioneering research on labour utilisation by Julius Shishkin (1976) of the US Bureau of Labour Statistics. Table 1 gives the corresponding estimates. By this method, the size of total unemployment (official plus disguised) in the US is 150 per cent of the published figure of official unemployment. Thus reckoned, the total unemployment in the US was as much as 10 per cent in 1993.

The US department of labour has just released the latest available data, for August 1996. The civilian labour force is 133.9 million, of which 6.8 million are out of work; so the official rate of unemployment is 5.1 per cent, a very low rate indeed. But according to the same report, 4.4 million are obliged to working part-time because full-time work is unavailable, and 0.4 million are 'discouraged workers' no longer looking for work in disappointment. Thus, the 'hidden' unemployment comes to 4.8 million, compared to the official unemployment of 6.8 million. The disguised unemployment was, by this logic, equivalent to 70 per cent of the open unemployment in August 1996.

The American scene of job creation has two aspects. First, it is apparently the best among the OECD countries. Second, yet it is not good enough, for the total unemployment rate is as high as about 10 per cent. Let us take these two features in that order. How did the US achieve relatively

FIGURE 2: CHANGES IN AVERAGE FAMILY INCOME BY QUARTILE, THE US

Source: *Economic Report of the President*, 1996:23, Washington, DC.

low open unemployment in comparison with the west European countries? The usual answer is: flexibility of the labour market. It is true, in part; but it cannot be the complete answer. The US has used two policy instruments, namely, wage rate and the exchange rate. As for the latter, suffice it to mention that for a quarter of a century to 1971 one dollar was worth 360 Japanese yen; since then it has depreciated, and through ups and downs it has reached the level of around 100 yen in recent years. Weakening of the dollar has helped American exports around the world.

As for the wages, the trend is unmistakably downward. Until the early 1970s, the history of the US job market in this century was one of rising wages – at about 2 per cent a year; thereafter, real wages have declined paving the way for what Freeman (1996) calls an 'apartheid economy'. The average hourly earnings (wages and benefits) of workers in private non-agricultural industries was (at 1982-dollars) 6.69 dollars in 1959, and rose steadily to the peak of 8.55 dollars in 1973. Then the downhill journey began, and the floor of 7.40 dollars was reached in 1992. It is crawling there as of now.

An eloquent picture of sharpening inequality in the US is given in Figure 2; it is a stylised version of chart 1.4, *Economic Report of the President*, 1996 (p 23). Between 1966 and 1979 Americans all across the income distribution enjoyed the benefits of

economywide growth in real incomes: families in the poorest fifth of the population saw their real incomes grow by 20 per cent, while families in the top fifth experienced real income growth of 28 per cent. But since 1979 family incomes have moved apart. Between 1979 and 1993 real family incomes in the bottom fifth fell by 15 per cent, while the incomes of the top fifth rose by 18 per cent. Amidst all this, incomes of the top 5 per cent of the families maintained their growth rate at 30 per cent in both periods.

A study released last year by the Twentieth Century Fund reveals that by 1989 inequality in the distribution of wealth in the US had reached a 60-year high. "The sharp increase in inequality since the late-1970s has made the distribution of wealth in this country more unequal than what used to be perceived as the class-ridden societies of north-west Europe. Today the US is the most unequal of any industrialised country in terms of income and, more importantly, wealth." The most telling finding, the report continues, is that the share of marketable net worth held by the top 1 per cent, which had fallen by 10 percentage points between 1945 and 1976, increased from 34 per cent in 1983 to 39 per cent in 1989. During the same time, the share of wealth held by the bottom 80 per cent fell by more than a fifth from 19 per cent to 15 per cent.

These trends are mirrored in financial net worth which is distributed even more

unequally than total household wealth. In 1989 the top 1 per cent of families as ranked by financial wealth owned 48 per cent of the total. The top 20 per cent of Americans accounted for as much as 94 per cent of all financial wealth [Herbert 1996]. Alongside this, place the following facts. After 18 months of phenomenal ascent, American stock market is hovering at the stratosphere. Since the end of 1994 the Dow Jones industrial average has climbed by 50 per cent; the broader S and P index has risen by 46 per cent. This has increased America's financial wealth by 2.4 trillion dollars – more than the entire annual output of Germany (*The Economist*, July 6-12, 1996:23). It means that *pro rata* the US stock exchange creates capital gains of 1.6 trillion dollars a year, while the 'real' economy of the US produces goods and services of some seven trillion dollars, and makes real investment of only one trillion dollars. And almost all of the immense capital gains accrue to a tiny fraction of the population. This highlights the crucial importance of the financial sector in the US economy.³

Financial markets are most sensitive to inflation that erodes the value of their holdings. It is therefore quite natural that the financial rentiers will declare inflation as their enemy number one. From here it takes a small step to realise why the concept of the so-called 'natural' rate of unemployment, or the non-accelerating-inflation-rate-of-unemployment (NAIRU) appeals so much to the policy-makers. Facts do not seem to support the NAIRU theory. On the one hand, the persistent double-digit unemployment rate in Europe has not led to deflation; on the other, nor has the fall of the official unemployment rate below the perceived 'natural rate' of 6 per cent triggered off spiralling inflation in the US in the last two years. Yet, reportedly, the myth of the NAIRU theory continues to hold the Federal Reserve in thrall; the Fed considers some unemployment as 'natural'. Ball (1996) shows that the main cause of rising unemployment during the 1980s was the tight monetary policy that most OECD countries pursued to contain inflation.

The drama of the evolution of American policy perspectives is well captured in three Acts. The US in the aftermath of the second world war was guided by the Employment Act of 1946 which stated:

The Congress hereby declares that it is the continuing policy and responsibility of the federal government to use all practicable means consistent with its needs and obligations ...to promote maximum employment, production, and purchasing power.

The top-most priority assigned to full employment is noteworthy.

The next stage was ushered in by the 1978 Full Employment And Balanced Growth Act, more generally known after its two sponsors as the Humphrey-Hawkins Act. The act established quantitative goals – a 4 per cent unemployment rate, and, yes, an interim target of 3 per cent inflation – as the nation's objectives. Now inflation has found a prominent place alongside with growth.

Finally, growth has been pushed out of the priority list. Senator Connie Mack has proposed the Economic Growth and Price Stability Act of 1995 that mandates the Federal Reserve to pursue zero-inflation as the prime target. Price stability, the act declares, "is a key condition to maintaining the highest possible level of productivity, real incomes, living standards, employment, and global competitiveness". It is a noble declaration, no doubt, observes Krugman (1996), but there is hardly any reason to believe that the underlying theory, syllogism, or evidence of the act are true. The Mack Act is misguided. An answer to Kapstein's query about policy paralysis, cited above, can possibly be found in the changing balance of power in the American economy and polity, specially in the rise and dominance of the financial-rentier class.

CONTRADICTIONS

The most fundamental flaw with the natural rate or the NAIRU theory is that, despite its professed dynamic nature, its underlying production function ignores the capital stock altogether. As the critiques like Akerlof, Dickens, and Perry (1996) put it the production function of the NAIRU theory is given by

$$(6) \quad Q = L.$$

Here Q is output, and L is employment. Evidently, (6) either assumes constant returns to scale with capital always mysteriously adjusting with the rise and fall of labour, or pretends that capital does not exist as a factor of production.

The productivity of labour depends upon capital. When the Fed raises the interest rate in anticipation of inflation, investment falls; and so its prophecy becomes self-fulfilling. However, the NAIRU theory, as such, is doubly indeterminate. First, it speaks of a rate of unemployment that prevents acceleration of the rate of inflation, but the rate of inflation itself is left to be specified. Now, the Fed closes this gap by announcing its target of zero-inflation. Second, the relationship between wages and price cannot be independent of the productivity of labour which in turn depends upon the volume of capital. This indeterminacy still persists in the literature.

One of the basic problems of the American economy is the slow pace of capital accumulation. Table 2 shows that the rate

of saving is falling – both the gross saving as a per cent of GNP, and the personal saving as a per cent of disposable personal income. With the fall of the rate of saving, the value of the multiplier (reciprocal of the propensity to save) rises. That means greater inflationary impact of autonomous expenditures like investment and export in the short run. And that prompts the Fed to raise the interest rate. As a result investment slows down.

But why is the propensity to save falling? There are several factors at work here. Two of them deserve special mention. The pattern of income and wealth distribution is getting increasingly polarised. On the one hand, impoverishment of the majority of Americans as depicted in Figure 2 drives the poor households to the point where their propensity to consume becomes almost one. On the other, the fabulous wealth of the affluent minority who also receive bulk of the income, makes their consumption pattern extravagant. Such a structural feature tells upon the rate of saving, raises the interest rate, slows down output growth, raises unemployment, and lowers the wages, further reinforcing the vicious circle. The economy, then, can hardly absorb a growing labour force.

The American dilemma can be cast in terms of an interplay between 'industry' and 'finance' as defined by Keynes (1930:42-43, 217-30). Innovations in hi-tech industries generate increasing returns that is sustaining a remarkable bull session in stock and bond markets. We know, the owners of financial wealth perceive inflation as a big threat, for it erodes the real value of their holdings, and reduces the price of their assets as interest rate rises in accordance with the Fisher equation. So they insist on zero-inflation. And they link up the rate of employment with the demand for higher wages that presumably pushes up prices. Thus, "a powerful antigrowth bias has been created in this country by the financial markets' theological commitment to the proposition that higher growth inevitably leads to higher inflation" [Rohatyn 1996]. Little do they care that, as estimated by Akerlof, Dickens and Perry (1996), trying to drive the inflation rate down to zero, "the nirvana of the bond market", would slow the economy by increasing unemployment by 2 per cent.

In contrast with the attitude of financial markets, American industry takes a different stand. The National Association of Manufacturers, for example, are convinced that not only higher growth is possible, but it is necessary for dealing with the country's social problems. The NAM recently issued a report calling for an objective of achieving a 3 per cent annual growth rate by the year 2000, and ultimately, 3.5 per cent a year. It is realised that powerful deflationary forces are at work all over the globe. The drive to

meet the Maastricht criteria for a common European currency is forcing budgetary contraction all over Europe. France and Germany are currently struggling with double-digit unemployment rates; and the overhang of mountain-size bad debts throughout the Japanese financial system is keeping its economy depressed. The ability to move production all over the world and the entry of over one billion people into the global workforce will hold prices and wages in the industrial countries on line. Under the circumstances, the threat of inflationary pressure is remote. What is more, a bit of inflation might be even welcome by the industry, for it serves as a convenient device to help reduce real wages when nominal wages are sticky downwards.

In this battle royal between industry and finance, the worst loser is labour. The stock market is booming; corporate profits are at an all-time high. But wages are low or falling; job insecurity is widespread. Signs of disguised unemployment are not so much hidden; they are openly visible in railroad stations and city streets. "Fully 2 per cent of all working-age American men are behind bars" [Kapstein 1996:22]—they are not even counted as part of the 'labour force' of the country.

Central banks of rich OECD countries are wedded to the doctrine of zero-inflation. The forthcoming European Monetary Authority, which will preside over the monetary union, will operate under a constitution that honours price stability above all else. The result will be aggravation of the already-serious unemployment situation in Europe. The current inflation rate in Canada is 1 per cent; and the central bank there is fiercely committed to extinguish all traces of inflation. The Canadian unemployment rate is now as high as 10 per cent; and it will certainly worsen as the central bank steers the economy to the plateau of stable prices.

When he drafted the bill senator Connie Mack might not have been aware of the costs of the act. Let us look at a comparable episode. The great disinflation of the 1980s brought down inflation from 10 per cent to around 4 per cent, but it was very expensive in terms of high unemployment and excess capacity. There was a deep recession: the 6 percentage-point drop in inflation entailed the cumulative loss of output of more than one trillion dollars. At present the rate of inflation is about 3 per cent. To wrench it out from the system, by the above-mentioned historical standard, it would require a decline in output by about half a trillion dollars which is equivalent to 7 per cent of current GDP. According to Okun's Law, then, unemployment will have to rise by as much as 3.5 percentage points; that is, some five million workers will lose their jobs. Will the US pay such a high price for price-stability?

Notes

- 1 Romer (1986) has pioneered a well specified competitive model of growth with increasing returns in the production of output, decreasing returns in the production of new knowledge, and externalities. Despite the presence of increasing returns, a competitive equilibrium with externalities exists. This equilibrium is not Pareto optimal, but it is the outcome of a well-behaved positive model. Here, each firm maximises profits taking the aggregate level of knowledge as given. In Arthur's (1994, 1996) economy, by contrast, innovations do not necessarily obey the law of decreasing returns. Hence the difference between Arthur's and Romer's findings.
- 2 The literature on asset bubble is relatively new, but fairly well developed [Blanchard and Fischer 1989; Grossman and Yanagawa 1993; Tirole 1982, 1985; Wallace 1980, and Weil 1987] except that it does not say what makes the bubble start in the first place, and how. Our point of departure is that we invoke Arthur (1994, 1996) to surmise that an asset bubble may be initiated by the emergence of an increasing-returns industry, and may come to an end as that industry eventually passes into a commonplace Marshallian commodity in the decreasing-returns part of the world.
- 3 The size and level of activity in US financial markets can be gauged from the following. According to the *Statistical Abstract of the United States, 1995*, the holdings of equities, and of corporate and foreign bonds were respectively, six trillion dollars, and 2.4 trillion dollars in 1994. The bond market seems to be more active in the sense that there the net purchases were worth 142 billion dollars, while those in the equity market amounted to 32 billion dollars in the same year.

Over the long period of 1926-1993, the Ibbotson Associates have computed, the geometric average return (nominal) was 10.3 per cent on common stocks of large firms, 12.4 per cent on those of small firms, and 5.6 per cent on long-term corporate bonds, while the inflation rate was 3.1 per cent [Poterba and Summers 1995:52].

Bernstein (1996) identifies a major turning point in the late 1950s when bonds first yielded more than stocks, blowing apart a relationship sanctified by more than 80 years of history. From 1871 to 1959, stock yields exceeded bond yields by an average of 1.3 percentage points, with only three transitory reversals of which the last one was in 1929. Since 1958, Bernstein notes, bond yields have exceeded stock yields by an average of 3.5 percentage points.

Child Labour in India

Putting Compulsory Primary Education on the Political Agenda

Myron Weiner

On educating its children India remains so behind the rest of Asia that it will take a major infusion of resources and political leadership to catch up. Deep class/caste divisions have been barriers to the development of a national drive for mass education by those who have made it to the upper strata. As the economy opens and employment opportunities grow with the expansion of the country's consumer industries, the governing middle class may recognise that the country needs a more literate population and therefore must invest in its children. But it will take a major coalition of locally based groups, the active participation of the media, the contribution of researchers and the information they disseminate, the support of investors, educators, social activists and trade unions and international donor agencies to get India to address the way it treats the children of the poor.

THE recent assassination of Iqbal Masih, a 12-year-old former bonded carpet weaver in Pakistan who campaigned against child labour, reminds us that child labour is not simply the working out of the market in a poor country but is made to happen by organised interests. This 12-year-old started working as a carpet weaver at the age of four when he was sold by his parents to a factory. Through the efforts of the Bonded Labour Liberation Front of Pakistan Masih was liberated from bondage in 1992 and subsequently achieved celebrity status when he was invited to give an account of his life at an international labour conference in Stockholm in November 1994. According to Ehsanullah Khan, president of the Bonded Labour Liberation Front, Masih had become the target of carpet industry owners and landlords and received death threats shortly before he was killed one evening in early April when a man with a shotgun fired at him, then fled.

Pakistan, India and Bangladesh have the world's largest number of child labourers, so that any effort to address the phenomenon of child labour in the third world must deal with south Asia. In this paper I shall focus on India, both because it is what I know best and because India has the largest number of child labourers in the world and a greater incidence of child labour than any of the countries outside this region.

We do not need statistics to make the point. Any visitor to India can see how widespread child labour is. In a drive through the rural countryside of Andhra Pradesh one sees children caring for cattle, not their families' cattle as one might suppose, but as indentured labourers paying off debts incurred by their parents. In a walk through the market in Bangalore one sees children working in the shops and as peddlers. A visitor to a Bihar village will see children working in the fields during school hours. In Bombay one sees street children everywhere—ragpicking in garbage dumps, cleaning tables in tea stalls, begging, pimping, and prostituting. In countless towns one sees children in small shops making matches,

weaving carpets, cutting diamonds, blowing glass, forging brassware, packing, hauling, sweeping.

The official statistics confirm the visual impressions. According to the government of India the number of working children was estimated at about 17 million in the National Sample Survey, with a projected 20 million working children by the year 2000. Other studies indicate that these figures are a gross underestimation. A study sponsored by the labour ministry reports that 44 million children in the 5-14 age group are in the labour force. Different definitions of the working child explain the wide variations in the numbers, since official figures generally omit children engaged in non-wage domestic work.

Figures on school attendance are somewhat more reliable. They are based on the national census and on surveys conducted by state education departments. According to the 1993-94 report of the department of education drop-out rates in classes one to five were 47 per cent and in classes one to eight 62 per cent. In other words, nearly half of India's children who enter first grade drop out by the fifth grade. Another government estimate puts the percentage of children in the 6-14 age group attending school at around 49 per cent, but a recent (September 1994) National Sample Survey conducted by the National Council of Applied Economic Research reports that the percentage of non-enrolled children is higher. According to official figures 90 million out of 179 million children in this age group do not go to school. These figures are eight million higher than what is reported in the 1981 Census. It should be noted that of every five children in school, only two are girls—with an even greater gender disparity in rural areas. The highest drop-out rates are among girls who belong to scheduled tribes.

The figures on literacy rates are consistent with the figures on school enrolment. The expansion of literacy has not kept pace with the growth in population. The 1981 Census reported that 314 million Indians were illiterate; the 1991 Census put the number

of illiterates at 335 million, an increase of two million a year. The 1991 Census reported that fewer than 40 per cent of the adult females in seven of India's states were literate, and as few as 25 per cent in Uttar Pradesh, India's most populous state. The reason for these high primary school drop-out rates and high illiteracy rates, Indian government officials say, is that many children don't want to go to school or are too poor to attend. So much for the numbers.

Most of the 90 million children not in school are working children. Some are paid by employers, others contribute to family income by caring for cattle, working in the fields or engaging in household industries, and still others work at home collecting water and fuel and taking care of younger siblings.

There are some parts of India's economy where you will not see children at work. Children do not work in the large textile mills, or in any of the large industrial plants. The factory acts ban the employment of children in large factories. Paradoxically, these are the enterprises where working conditions (ventilation, lighting, sanitation, etc) are at their best and wages are higher. Children are, however, legally permitted to work in cottage industries, and in the household and service sectors where working conditions are not regulated, wages are low, and hours are long.

The Child Labour Prohibition and Regulation Act of 1986 emphasises regulation rather than prohibition of child labour. The legislation bans the employment of children in factories and restricts employment in so-called hazardous work, but children are otherwise permitted to enter the labour force—at any age. Though children are not employed in the large factories they can legally be employed in small workshops. Much of the carpet weaving in India is done in household workshops where children and their parents perform piecework. Though children are prohibited from working in the large match-making factories in Sivakasi, they are free to work in the numerous small workshops scattered outside the town. Large

numbers of children work in tens of thousands of tea stalls and restaurants. And, of course, most children work in the agricultural sector, often as agricultural labourers. Many middle class households also employ children as sweepers and household servants. The main point is that there are hundreds of thousands of employers of children in India.

Many third world governments, India's included, have argued that western countries are attempting to impose their own values upon them by insisting upon an end to child labour. Child labour, they argue, is not as onerous as it was in the west. Children, they say, are not being exploited since they are part of family labour where they acquire skills as apprentices. Moreover, poor families need the labour and the income of their children and should not be coerced into sending them to school. The schools themselves are often irrelevant to their needs. Finally, it is argued that small-scale industries need low-wage labour to survive if they are to compete against large and more efficient firms.

Some western economists find many of these arguments credible. *The Economist*, for example, wrote that "Poor families need the income of children, whatever the law says... Better schools and faster economic development will help reduce child labour" ('The Little-Match Girls', *The Economist*, January 15, 1994, p 38). Restrictions on the importation of goods produced by children might slow economic growth and therefore delay the reduction of child labour. In short, culture is not the barrier to the elimination of child labour, but economics. The policy conclusion, don't try to change the cultures, but do try to improve the economies of developing countries.

The story, I shall argue, is more complicated than that. Culture is a factor not in the attitudes of parents but in the views of policy-makers. If the US and other developed countries are to play a role in the reduction and elimination of child labour in developing countries we need to understand better what sustains child labour and how and why it ended in industrial and in many of the newly industrialising countries.

"The government", a senior Indian education official told me, "should not force poor parents to send their children to school when it cannot provide employment for all adults. Children are an economic asset to the poor. The income they bring in and the work they do may be small, but parents close to subsistence need their help." Before analysing this widely held view, let us first report on the views of education and child labour expressed by some of India's children.

CHILDREN'S VIEWS

Late one evening I met with a class of 25 girls in a one-room schoolhouse in a village 30 kilometres from Pune. They were all daughters of ex-untouchables and low-caste

families who spent their days at home doing household work, and their evenings in a non-formal education programme, one intended for children who do not attend the regular primary school. The children, aged nine to 13, were in the class from seven to nine in the evening, where they played and sang, were taught reading and numeracy, and were given some instructions in basic health and science. The children showed me a simple scientific experiment they had learned and answered my questions about germs. The teacher, a local woman, was paid by the Institute of Education in Pune, a non-governmental research and training organisation, which also provided the class with some rudimentary educational materials. The class was one of several experimental programmes run by the institute headed by Chitra Naik, a well known educator.

One by one each of the girls answered my questions. What were their names and ages? What did they do during the day? What did their parents do? Had they ever been to school and for how long? The children were remarkably articulate. Half of the children had been to school for one year or less. A few had completed two years of school. Only one girl had completed the third standard. None were literate before coming to the non-formal education classes, including the one girl who had completed the third standard. A few of the children worked for wages, but most were at home helping their mothers. They looked after their younger siblings – almost all were the eldest daughters; they fetched water and firewood and cared for the cattle. Since their mothers often worked, many of the children prepared the meals for the entire family.

I asked the class whether they would have liked to remain in school. All but two girls raised their hands. The two explained that they had done so badly learning to read that they didn't want to remain in school, but the others said they left school at the request of their mothers. I asked the girls if they would keep their own daughters in school. All of them raised their hands. "But what would you do", I asked, "if you had to work and needed your eldest daughter to take care of your younger children?" "I would send my babies to my mother-in-law", said one girl. "We could have a creche," said another, "and we could have someone watch over all the children." "Who would take care of the cattle?" I asked. "We could bring the cattle together", another girl replied, "and hire someone to look after them". The girls clearly did not regard their parents' decision about their schooling as choiceless.

These girls had a clearer vision of what was best for themselves and what was possible in their own lives than I had heard expressed by India's educated classes and by Indian policy-makers. The children all thought it possible to attend school if only their parents would send them. Then why isn't education made compulsory?

There is an unspoken consensus among India's political leaders that education should not be made compulsory since parents should have the right to use or sell the labour of their children. No political party in power, including the governments of Indira Gandhi, Rajiv Gandhi, or the government led by Narasimha Rao, has introduced legislation to make school compulsory. The prime minister continues to emphasise the importance of adult literacy programmes and non-formal education, but not compulsory primary school education. Nor have any of the state governments made education compulsory, including the communist government of West Bengal. Moreover, no political party has called for banning child labour.

After independence the Indian government chose not to reverse British colonial education policy with respect to primary school education. In contrast with the countries of Europe and many in Asia, the idea of compulsory education was not firmly planted in either India or Pakistan. In 1882 several Indian and British officials argued for introducing compulsory education before the Indian Education Commission, but the proposal was never seriously considered. Shortly before the first world war, Gopal Krishna Gokhale, then president of the Indian National Congress, took up the issue in the central legislature in New Delhi. He introduced a private bill proposing that local bodies be authorised to introduce compulsory education in their area. The bill was widely circulated and while it received support from leaders of the Indian National Congress and the Muslim League, a majority of the members of the central legislature, most officials, and representatives of the princely states were opposed. The government regarded the proposal as utopian on financial and administrative grounds. In 1918, Vithalbhai Patel introduced a bill in the Bombay legislative council permitting municipal areas of the state to make education compulsory. The bill was passed and thereafter other states under British rule passed similar laws. These laws remain in force today, both in India and Pakistan, but it should be noted that all these laws *permit* but do not *require* local authorities to make education compulsory. The laws are enabling legislation, modelled after an 1871 act of the British parliament which was superseded a decade later by a parliamentary act requiring local authorities to make education compulsory. Since these acts are called compulsory education laws many Indian officials, even including members of education departments and ministries, mistakenly believe that education is compulsory, only that the legislation is not enforced.

Many officials similarly believe that child labour is illegal, only that these laws are also not properly enforced. In both India and

Pakistan child labour laws are based on British laws passed in the 1920s and 1930s which restricted the employment of children in selected sectors of the economy, e.g., mining, shipping, and in large industrial factories, but otherwise permitted children of any age to work in agriculture, small-scale industries, and in the service sector. Moreover, since primary school education has been voluntary, parents remain free to remove their children from school and enter them into the labour force. The Indian government spends less on primary education than most other Asian countries and puts a disproportionate share of its educational resources into higher education, a political decision which benefited the middle classes while leaving the rural and urban poor educationally impoverished.

In fact, Indian government policy has promoted the employment of children. Industries subcontract to so-called family-owned workshops which are permitted to employ child labour. There is no statutory protection for children in factories that employ fewer than 10 people; the government policy of supporting the small-scale sector promotes the employment of children in unregulated hazardous work. Through its centres for training children as weavers for the carpet industry, the government competes with schools to attract children. Government officials are frank in saying that child labour helps to sustain otherwise uneconomic small-scale industries and keeps costs down so that the carpet, gem, and brassware industries can expand their exports.

A critical empirical examination of the evidence related to these widely held views can be founded in a recent study by an Indian scholar, Nccra Burra, based upon intensive field investigations of five industries—gems, brassware, glass, pottery, and locks. In the pottery industry, she reports, children have displaced adults in the labour market. She writes, "Employers prefer child labour because it is cheaper than adult labour and because children, unlike adults, cannot question the treatment meted out to them. Evidence indicates that the child's wage...is a third to a half that of adults for the same output, with the child working for as many, if not more, hours than the adults." Burra reports that in the industries she surveyed children were engaged in work that is unsafe and unhealthy. In the lock industry children work with potassium cyanide, trisodium phosphate, sodium silicate, hydrochloric acid, and sulphuric acid. They inhale noxious fumes, are exposed to electric shocks, and suffer from tuberculosis, bronchitis, asthma and other diseases. In the brassware industry children work at high-temperature furnaces and inhale the dust produced in polishing; in pottery children suffer from respiratory illness from inhaling clay dust; the glass industry is particularly hazardous, since children carry molten glass and work around furnaces with intense heat. Even when

children are not employed in hazardous work, the environment itself often puts children at risk. Household employment is not normally dangerous, but children as domestic servants are often beaten and sexually abused and children employed in dhabas are at the mercy of their employers.

Officials and employers argue that children serve as apprentices, acquiring needed skills for adult employment, contributing to the income of their families, and are mainly employed as family labour. They further argue that the employment of children sustains India's traditional craft-oriented industries and that child labour makes India's exports more competitive. The studies by Burra and others do not support these arguments. Indeed, in the lock industry in Aligarh and in the brassware industry in Moradabad children do not work side by side with their parents and in a number of industries (pottery, for example) there is evidence that children are employed in regions where there is a high level of adult unemployment.

Children in the labour force can acquire special skills. In the lock industry, for example, children work on buffing machines, electroplating, spray painting, filing components, making springs, assembling and packing locks. But no skills are acquired that could not be learned as easily by older children and young adults, that is by postponing the entrance of children into the labour force until the ages of 14 or older. Early entrance into the labour force has sometimes shortened the working lives of young people who, now adults, are too ill to remain in the labour force. Adults in Firozabad who used to work around the furnaces in the glass industry as children report that they send their own children into the labour force since they themselves are now physically unable to work.

Child labour is on the increase in export industries such as gems, brassware and carpets. Owners of the small shops and government officials argue that the expansion of these exports is made possible through the employment of children. Nimble little fingers, they say, enable children to do work that adults cannot readily do or do as well. Children can produce a greater number of knots in the weaving of carpets than can adults. They can carry molten lead near furnaces, under conditions that adults would find intolerable. They can work with their eyes 10 inches from machines using silicon for polishing gems, tasks that need diligence, dexterity and speed rather than physical strength.

Without children in the labour force, officials say, these tasks would not be performed as well. And since children are paid less than adults they are able to produce goods at a lower cost. As a result of these lower costs, many industries are able to compete in world markets. Without child labour, it is argued, carpets and handloom

textiles might be replaced by machine-made products, bidis (hand-made cigarettes) would give way to factory-made cigarettes, and matches and firecrackers would be made by multinational corporations. There is little evidence to support these claims, though they are widely held to be true. In many industries the contribution of labour costs to the total costs of production is small; moreover, the availability of low skilled low-wage children has reduced the incentives of businessmen (in the brassware industry, for example, and in footwear) to acquire the sophisticated technologies that would enable them to make export-quality products comparable to those of Bangkok.

Child labour has kept girls out of school. Employers are often particularly eager to employ young girls, since they are paid less than boys and are often employed at younger ages. In the Sivakasi match industry, most of the child workers are girls below the age of 14, and their wages are well below the agricultural wages in the region. In other industries, in coir, gems, bidis, locks, carpets and embroidery, girls are paid less than boys and are employed in jobs requiring no schooling. The result is the female attendance in primary schools is low and female literacy remains low. As noted, in 1991 the percentage of adult female literates to the total female population remained under 40 per cent in Andhra Pradesh (33.7 per cent), Orissa (34.4 per cent), Madhya Pradesh (28.4 per cent), Uttar Pradesh (26.0 per cent), Bihar (23.1 per cent), Rajasthan (20.8 per cent) and Arunachal Pradesh (29.4 per cent), all states with a high incidence of female child labour. The pattern is self-perpetuating. Uneducated parents send their children to work, and in turn the uneducated daughters as adults then send their children to work.

Apart from employers, India's middle classes also gain from these policies. For nearly a half century the Indian government has given a higher budgetary priority to the expansion of higher education than to mass elementary education. Compared to many other developing countries India spends a smaller proportion of its GNP on elementary education and a greater proportion on higher education. Subsidies are provided to private elementary schools and to elite public schools for civil servants and the military. Education, said the planners, was 'an investment in human resources', essential to economic growth, but to the planners that meant an expenditure of funds on the education of the middle classes who could be employed by the government and in the public and private sector firms that were protected against international competition.

Middle class families employ children from the lower classes to work in the kitchen and to serve as sweepers. Children are also employed in many offices, providing tea for clerks and even for academics in research institutes! Many middle class Indians have a conception of 'children's work'—or more

Committed to examining diverse aspects of the changes taking place in our society, this journal appearing twice a year in March and September aims to encourage scholarship that perceive problems of development and social change in depth, documents them with care, interprets them with rigour and communicates the findings in a way that is accessible to readers from different backgrounds.

Apart from papers by authors drawn from different disciplines in the social sciences, RDC has three distinct features. In order to encourage young scholars, each issue will carry at least one article based on a recently completed Ph.D. thesis in the social sciences. Issues relating to development and social change are discussed in seminars, conferences and other gatherings. RDC will have a place for reports of such discussions. Each issue will have a commentary on data and sources on a selected theme.

Vol. I No.1, Jan-June 1996

Satish Saberwal, Enlargement of scales, plural traditions, and rule of law; *K.K. Subramanian*, Economic reforms, foreign firms and export performance; *M.V. Nadkarni*, Political economy of sustainable development; *Manabi Majumdar*, Democracy, welfare and the role of the state; *D.Jayaraj & S. Subramanian*, Poverty-eradication through redistributive taxation; *Barbara Harriss-White*, Primary accumulation, corruption and development policy; *N. Subba Reddy*, Farm size, technology and productivity; *C. T. Kurien*, Institutions in economic theory and policy; *R Rukmani*, Factors underlying high dispersal of towns in Tamilnadu. (Doctoral Work); Privatization of Higher Education (Report) State Statistical Bureaus as sources of data (Data) and Book Reviews.

Vol. I No.2, July-December 1996

Kuldeep Mathur, Neo-liberal agenda and study of institutions; *A. Vaidyanathan*, Socio-economic characteristics of villages in North Arcot; *E T Mathew*, Employment and unemployment trends in Kerala; *John Kurien*, Diffusion as a process; *R Hema*, Regulated public trust utilities; *J. Jeyaranjan*, Traditional agriculture (Doctoral Work); The Political Economy of Transformation in Tamil Nadu; Revisiting village Asia (Reports); Village surveys and resurveys (Data) and Book Reviews.

Contributions are invited and will be accepted for publication after the process of refereeing. For Guidelines for Contributors please write to Programme Coordinator, MIDS.

Subscription covering two issues of a volume is as follows:

India and other SAARC Countries

Individuals	Rs. 100/-
Institutions	Rs. 150/-

Foreign (by Air mail)

Individuals	US \$ 25	20
Institutions	US \$ 50	40

Account payee cheques/drafts to be drawn in favour of Director, Madras Institute of Development Studies. (Outstation cheques must include bank commission).

Adyar, Madras 600 020.

precisely, poor children's work – as both a phase in the education of a child and as a distinctive niche in the economy. They conceptualise a distinction between the children of the poor and their own children, between children as 'hands' who must be taught to work and children as 'minds' who must be taught to learn. It is this conception that leads middle class officials to criticise India's primary schools for their failure to emphasise 'work', vocational training, and agriculture; as if the poor need to be taught how to work.

ALTERNATIVE VIEWS

Government officials in other poor countries have not shared the Indian views, neither in Japan which introduced compulsory education in 1872, not in North and South Korea, Taiwan, and the People's Republic of China, all of which made education compulsory shortly after the second world war. All of these countries introduced compulsory education when per capita incomes were low, poverty was widespread, and parents would have employed their children had they been permitted to do so. By 1910 Japan was able to ensure that 98 per cent of the six to 13 age group attended school; in 1943 Taiwan made six years of primary school education compulsory; both North and South Korea launched massive campaigns in the 1950s to get all their primary school age children into school. The People's Republic of China is another dramatic case. In 1949 only one-fourth of the children were in primary school, but by 1982 the figure was 93 per cent, with 70 per cent completing sixth grade. Sri Lanka massively expanded its primary school enrolments in the 1950s. By 1981, 90 per cent of primary school age children were in school and 70 per cent of all children completed five years of schooling. The story is similar for most of the countries of south-east Asia. Indonesia has made schooling compulsory, with the result that three-quarters of all children complete six years of schooling, female education is nearly equal to that of males, adult literacy has leaped to 82 per cent, and there has been a marked decline in child labour.

In the west too, many countries made education compulsory before the industrial revolution. In 1524 Luther sent a letter to German municipalities saying it was their duty to provide schools and the duty of parents to educate their children. In 1647 the colony of Massachusetts passed a law compelling local authorities to set up compulsory elementary schools. In 1723 Sweden decreed that parents and guardians who failed to send their children to school would be fined.

The motives for making education compulsory were diverse. Compulsory education was introduced earliest in Protestant countries, where there was a

widespread belief in the importance of reading the Bible. Communist countries, irrespective of their stage of economic development, introduced compulsory education as an instrument for socialising the young into the new ideology. In Prussia military conscription made the state keen to improve the health and education of children. In France anti-clericalism was a major factor in creating a state-run secular education system. In Meiji Japan the elite regarded mass education as both an instrument for enhancing Japan's capacity to compete abroad and for inculcating loyalty to the state.

There is no single economic or political determinant, either among the early industrialised countries or among the contemporary developing countries where education has been made compulsory. Many countries successfully made primary school education compulsory and universal when per capita incomes were low, poverty was widespread, and parents would have employed their children had they been permitted to do so. Nor can it be argued, as some have, that the introduction of compulsory education was driven by changes in technology which required more skilled, educated workers. More to the point, the end of child labour and illiteracy in the workforce enabled industries to employ technologies that required higher skills.

There are two other generalisations that can be drawn these diverse stories. One is that in each of these countries the notion developed that education should not be regarded merely as a right granted by the state, but as a *duty*, imposed by the state. When education is made a duty, parents, irrespective of their economic circumstances and beliefs, are required by law to send their children to school. It is the legal obligation of the state to provide an adequate number of schools, appropriately situated, and to ensure that no child fails to attend school. Adam Smith wrote that "for a very small expense [sic] the public can facilitate, can encourage, and can even *impose* [emphasis added] upon almost the whole body of the people, the necessity of acquiring those most essential parts of education". John Stuart Mill wrote that the state should compel the education of "every human being who is born its citizen" and that the state "ought not leave the choice to accept or not to accept education in the hands of parents".

This shift from rights to duties is a profound one in the history of the relationship between children and the state. Theologians, with their vision of God-fearing, law-abiding, moral youth; educators, with their vision of schools transmitting the enlightenment values of secularism, rationalism, cosmopolitanism, and individualism; and revolutionaries, with their romantic vision of social transformation, provided much of the driving force behind the idea of compulsory mass education. Theologies and

ideologies were critical determinants. Had the early advocates of compulsory education written the United Nations Convention on the Rights of the Child, they might well have called it the Convention on the Rights of the Child and the Duties of the State.

The second generalisation is that the establishment of compulsory education was a necessary condition for the reduction and abolition of child labour. Without compulsory education governments would not have been able to enforce child labour laws. In one country after another the phased extension of the age of compulsory education went hand-in-hand with a phased extension of restrictions on the employment of children. If the school-leaving age is lower than the age of admission to employment, children are likely illegally to seek employment, and the enforcement of child labour laws is rendered more difficult. It is administratively easier to monitor school attendance than to monitor children in the work place, especially when there are thousands and tens of thousands of employees, and easier to force parents to send their children to school than to force employers not to hire children. No country has successfully ended child labour without first making education compulsory. So long as children are free not to attend school, they will enter the labour force.

Had it followed the route of those countries whose governments believed in the importance of mass education, India today would have a higher literacy rate, a lower incidence of child labour, and, most probably, a greater reduction in the fertility rates since children would no longer be seen as financial assets to the family. But Indian policy-makers continue to be mired in a set of views that preclude their taking the necessary steps to get children into school and out of the labour force; and they pursue a set of industrial policies that promote the employment of children in the small-scale sector. Moreover, these views are so widely shared in India that no political party of the left or right, no trade union, no religious organisation, and not even the educational establishment has been pressing for policy changes. Even officials who recognise that regular school attendance is desirable believe that the responsibility of sending children to school should be with parents, not with the state. Policy-makers continue to argue that child labour cannot be eliminated while there is poverty. Instead government programmes have worked around the fringes of the problem; by promoting adult literacy campaigns, providing non-formal education to working children, and providing free school lunches to encourage children to remain in school.

Neither the central nor the state governments have been willing to do what has been done historically by every developed and now by many developing countries: declare that all children ages six to 12 or 14 must attend school, that parents, no matter how

needy, will not be permitted to remove their children from school, that school attendance will be enforced by local authorities, and that the government will be obligated to locate a primary school within reasonable distance of all school-age children. Only through such a policy will it be possible to make elementary education universal, to raise India's literacy rate to that of other large developing countries within a generation, and to bring an end to child labour.

NEW DIRECTIONS

There is a growing awareness in India of the country's failure to address the needs of children. Indian officials are under international pressure to eliminate child labour. Germany and the US are considering whether to impose restrictions on the import of goods produced by children. Since child labour is illegal in western countries, governments, trade unions and consumers are becoming increasingly loath to import carpets, textiles, sporting goods and gems produced by child labour. A bill introduced in the US Senate by Senator Harkin (The Child Labour Deterrence Act) would close US markets to carpets not certified child labour-free. Even if a legislative ban is not imposed there may very well be a boycott by European and American consumers who are unwilling to buy products produced by child labour. The Indo-German Export Promotion Project (IGEP) has already targeted the carpet industry in developing countries. The German-supported Delhi-based Rugmark Foundation places its trademarks on carpets made without child labour. Dietrich Kobschull, the organisation's director, estimates that carpets with the Rugmark "will cost only 2 to 3 per cent more than other Oriental carpets, if that" (*Far Eastern Economic Review*, February 2, 1995, p 26). The foundation works closely with a group of exporters who belong to an association called the Carpet Manufacturers' Association Without Child Labour and with the Delhi-based South Asia Coalition on Child Servitude, headed by Kailash Satyarthi. "Rugmark represents years of campaigning in India, Germany and elsewhere. It's not the end of child labour, but it's a breakthrough", said Satyarthi. Pressure for action on the educational front has also come from the World Bank, which has reminded governments that poor education and poor health are barriers to economic growth, from UNICEF, which has pointed to the links between compulsory education and child labour, and from the International Labour Organisation, which through its International Programme on the Elimination of Child Labour (IPEC) has been providing funds to initiate programmes to reduce the use of child labour.

A hundred years ago, in the last decade of the 19th century, an American non-governmental organisation called the

National Child Labour Committee (NCLC) conducted a series of studies of child labour in US industries. These studies – which now occupy several feet of shelf space in Harvard's Weidner library – documented the plight of America's working children. The social activists and scholars who prepared these studies described the conditions for children in textiles, cigarettes, glass, and in other industries throughout the country. The NCLC used these studies as part of its campaign to appeal to the conscience of Americans and to lobby state legislatures to extend the age of compulsory education (in 1900 education was compulsory up to age 14 in only 31 states) and to ban the employment of children. The NCLC also commissioned a freelance photographer, Lewis Hines, to photograph young children in the work place. His photos helped stir up public opinion and Congressional sentiment. Through the lobbying efforts of the NCLC state governments extended the years of compulsory schooling and introduced the system of 'working papers', employment certificates which permitted young people to work only after they had completed at least six years of schooling and were over 14 years of age. The NCLC was subsequently also instrumental in getting national legislation passed to supersede weak state government laws on child labour, though it was handicapped by the Supreme Court, which until the 1930s ruled that national child labour legislation was an unconstitutional interference with the states.

A similar campaign is now under way in India to pass stricter child labour laws and to introduce compulsory primary school education. While there is no national NGO in India comparable to the NCLC, a small band of social activists, journalists, scholars, and film-makers have been hard at work appealing to the conscience of officials and to the Indian public. Meera Nair, in a much acclaimed prize winning film, 'Salaam Bombay', poignantly portrayed the life of Bombay's street children. Smithu Kothari, Manu Kulkarni and Harbans Singh have described conditions for children in the notorious match industry in Sivakasi. Sheila Barse and Debasish Chatterji have written articles on children in the glass industry. Neera Burra, a research scholar on the staff of the International Labour Organisation, has been studying the lives of children in some of the major industries that employ children: the brassware industry in Moradabad, pottery making in Kurja, gem polishing in Jaipur, lock making in Aligarh, and glass factories in Firozabad. Articles on the plight on children have appeared in the magazines *Frontline* and *India Today*, and in India's leading dailies. A number of non-governmental organisations and public interest lawyers have also been a voice for a pro-active policy towards children. The results thus far have been modest. The

government of India has declared its intention significantly to increase expenditures for primary schools in the next Five-Year Plan, though the increases in the recent budgets remain small and there has been no effort to move towards a national policy of making education compulsory. One state government, Tamil Nadu, has announced its intention to make primary education compulsory and to remove children from the match industry in the infamous town of Sivakasi, but it is too soon to assess the effectiveness of the effort. The most important impact thus far is an increase in public awareness among the middle class that child labour constitutes a problem – is even a matter of shame – for the country.

Three arguments are still widely raised in India against compulsory schooling. The first is that since existing schools are unable to meet the needs of the poor, parents should not be forced to keep their children in school. It is painfully true that India has not satisfactorily addressed the serious problems in primary education – the lack of trained and motivated teachers and the absence of adequate teaching tools, blackboards, play equipment, and books. Paradoxically, government officials justify their reluctance to make education compulsory by pointing to their own failure to improve the schools! When the state or central governments in India do decide to make primary schooling universal and compulsory they will need to take major steps to improve their quality, but to wait until governments tackle the issue of quality education before making primary education universal and compulsory is a formula – and a justification – for doing nothing.

A second objection to compulsory education is that it may be difficult to enforce. There are so many laws that are not now enforced, it is argued, why should a compulsory education law be different? Countries that have introduced compulsory education have relied upon local officials, such as teachers, members of school boards, members of the local government, or appointed officials, to visit the homes of parents who have removed their children from school to inform them that school attendance is mandatory. In Indonesia, funds have been made available to assist parents who desperately need the income or labour of their children (widows, for example). Told that schooling is compulsory, few parents are likely to challenge the authorities by insisting that they be allowed to send their six-, seven- or eight-year old children to work instead. In countries that have made education compulsory, education has soon become a norm in the local community, a norm more often enforced by community pressures than by authorities. Such a norm is already in place in Kerala and in Sri Lanka, where primary school education is nearly universal and drop-out rates are low.

The third, and perhaps the most persistent, argument used in official circles in India, is that child labour cannot be tackled without first addressing the issue of poverty. As we have already noted, those who put forward this view argue that the country must wait until per capita incomes have risen and poverty has been reduced; only then will families remove their children from the labour force and place them in schools. Poor families, they say, must not be denied even the small income that children bring into the household. These arguments have been rejected by most other Asian countries, whose leaders have regarded mass education as an instrument for the reduction of poverty rather than as a solution to low household income.

NEXT STEPS

The issues of child labour and compulsory education are not yet on the political agenda in India. It was not an issue in any of the state assembly elections in 1994 or early 1995; no political party has made policies toward children part of its political platform; no major candidates for public office have spoken up on the subject. The then prime minister Narasimha Rao said little more than that the government intended to spend more on education, and he was publicly defensive on the issue of compulsory education. The issue is not on India's political radar screen.

International pressure through the boycott of goods produced by child labour is likely to have a limited impact. The Indian government has rarely been responsive to international pressures on most issues – such as Kashmir or nuclear proliferation, or earlier, on foreign investment. In this intensely nationalist country reactions to international pressures are often perversely. However, to the extent that individual manufacturers are persuaded that their products will not be sold abroad unless they can demonstrate that they do not employ child labour, international market pressures can have an impact. The practical effects, however, are likely to be modest, since children pushed out of one industry can often readily move to another. In any event only a fraction of India's child labourers are employed in export-oriented industries. A ban by importers of goods produced by children, even if there were an effective way of labelling goods, would have only a marginal impact on the total employment of children; other sectors of the economy are expanding rapidly enough to meet the supply of child labour. In the next few years we may see an expansion of agricultural produce both for local consumption and for exports and with it a growth in food processing industries that employ children. Wherever economic expansion occurs there will be a niche for children. Still, as we shall see, international pressures or, more accurately, international incentives, should not be dismissed.

Some Indian organisations are pressing for changes in the Child Labour Prohibition and Regulation Act to ban the employment of all children under the age of 14. A change in the legislation would be helpful, since the moral as well as the legal sanctions implied by a ban may deter some employers from hiring children, but those who choose not to obey will find it easy to evade enforcement. India's social workers report that the existing act is not enforced, particularly those provisions that restrict the employment of children in listed hazardous occupations. In the event of a total ban, employers of children could readily bribe officials in the state departments of labour. The lower levels of the civil service in India are notoriously corruptible. As a practical matter the staff required minimally to enforce a ban on child labour would be enormous, given the number of workshops, restaurants, landowners and households employing children. So long as the numbers of children in the labour force are as high as they are, a legal ban on employment, though helpful, is likely to have only a limited impact on child labour.

How, then, can reform be made to happen? How can India's state and local governments be persuaded to make education compulsory, to enforce primary schooling, and to move toward the removal of children from the labour force through the gradual expansion and enforcement of child labour laws? More broadly, how can the country as a whole be persuaded that India's children ought to attend school, that literacy and numeracy are vital skills for the entire population, and that the education of girls can have far-reaching consequences for national health and for population growth? I should like to suggest four courses of action.

First, there is a need for a considerable expansion in public and official knowledge on the magnitude and consequences of child labour in India. Much of the public discussion presently takes place in a knowledge vacuum, and worse, is based on misinformation. Consider how little we know on the following questions: how many children are in the labour force? What contribution do children make to household income? In families with child workers, are adult members of the family unemployed and, in effect, therefore, displaced by their own children? How widespread is adult unemployment in areas in which children are working? How many children live in single parent families, with a widowed mother dependent upon the labour of her children? What wages are paid to children and how do these wages compare with those paid to adults in the same industry performing similar work? At what age do children enter the labour force? What is the incidence of female child employment? How many years of schooling, if any, do children have before they enter the labour force? How many children in the labour force are homeless or live in the household of their employers rather than at home? How many

children are employed in the household sector by their own parents, or do children largely work for employers outside the household? How many children are subsequently discarded from the labour force because of disabilities incurred as a result of their employment? What is the incidence of bonded labour among children?

The answers to these questions could be obtained by national household studies. This kind of micro information would enable state and local governments to formulate appropriate policies, dispel a great deal of misinformation among government officials, and, as part of a public information campaign, would strengthen the capacity of organised groups to press for policy changes. In addition to household studies, research on specific industries that employ children would also contribute both to public understanding and to public policies. Many officials continue to believe that some of their export industries are made competitive by the employment of children, though no data are available on the relationship of wages to overall costs and whether a decline in the employment of children would weaken or enhance the competitive capacity of producers. Would producers lose if children under the age of 14 were removed from the labour force and replaced either by adults or by new technologies?

Secondly, policy promotion by India's non-governmental organisations is still in a rudimentary form. India's NGOs have, in the main, turned their attention to working with their clients rather than in organising themselves as political lobbies to seek legislative and programmatic changes. Few NGOs have decided what it is that they want governments to do. Among the policy issues that need to be addressed are these: the establishment of compulsory education in selected cities and districts; the creation of programmes to eliminate the employment of children in selected local industries; the establishment of pension schemes for widows to enable their children to attend school; and the creation of improved local enforcement mechanisms for child labour laws and compulsory education programmes.

NGOs can also play a more active role within local communities in dealing with these issues, especially by helping to establish community-based parent/teachers associations to promote school attendance and to reduce the number of drop-outs. NGOs can promote the establishment of funds for individual schools for the improvement of school facilities: play equipment, volley ball courts, blackboards, books for school libraries, the purchase of calculators, computers, television sets and school uniforms, and the establishment of school lunch programmes and school-based inoculation programmes. In urban areas funds can be raised through soliciting local businesses; elsewhere, support will have to be sought from village, taluka and district

panchayats, and from district education offices. In India's highly decentralised system it is hard to see how there can be a significant improvement in the quality of local schools or in the effective enforcement of compulsory education laws or child labour laws without substantial involvement from the local communities. India's numerous NGOs can be a pivotal force in local community organisation.

Third, foreign investors can have a non-trivial impact on the employment of children by ensuring that the firms with which they collaborate and from which they purchase do not subcontract with suppliers who employ children. Reebok, Liz Claiborne and other firms have refused to purchase from suppliers who indirectly employ children. Levi Strauss requires that its suppliers (in 50 countries) agree to adopt a labour code that includes a prohibition against the employment of children under 14. In effect these firms are choosing to reward those companies that maintain acceptable labour standards. As US firms in South Africa agreed to conform to the Sullivan principles, so too should companies agree to sign on to a comparable set of principles with respect to the employment of children and to other minimum labour standards. Labour attaches in US embassies could provide investors with information that would alert them to producers and suppliers employing children. Boycotts and threats against US firms or Indian firms are less likely to produce results than an active campaign to seek producers who do not employ children and who can demonstrate that the older children they employ (those over the age of 14) have acceptable working conditions.

Finally, though it is easy to be cynical about the establishment of international norms with respect to working conditions, they have an important role to play. There are already in place international norms concerning the employment of children, especially those below the age of 14. India has signed the UN Convention on the Rights of the Child which contains provisions (Articles 32 and 36) calling for the banning of child labour and (Article 28A) calling for the establishment of universal compulsory primary education.

While international conferences on the treatment of children and the requirement that signatories to the UN Convention regularly report on their progress are important in altering norms, the primary need is to create in India a network of institutions that regard these norms as applicable to local conditions. India has an increasingly vigorous civil society, but as we have noted earlier few groups pay attention to the condition of children. The ministry of human resources has shown little interest in promoting mass education or reforming the inadequate primary school system. Teachers' unions are more concerned with wages, transfers and perks than with

the education system. Trade unions have focused on preventing privatisation of the public sector and preventing the creation of an exit policy, not with restricting the employment of children. Employers have no interest in ending child labour since large firms subcontract to the small-scale industries to obtain goods at lower costs, and small manufacturers are looking for low-cost, pliable, and easily dismissable labour. The actors that have mattered elsewhere are not sufficiently engaged in India.

As is well known, in recent years there has been a growth in international civil society, that is in non-governmental institutions that support one another across international boundaries and form coalitions to influence their respective governments and international institutions. The most effective network thus far is in the area of the environment. We do not yet have similar linkages with respect to labour standards, particularly in the employment and education of children. An important question, therefore, is whether unions in the west can persuade union officials in India that child labour in India is as detrimental to adult employment as it has proved elsewhere in the world, and that the promotion of compulsory education and the removal of children from the labour force will result in an increase in jobs for adults. Can teachers' unions in India be persuaded by teachers' unions elsewhere that their status in the community will be enhanced if they play a pro-active role in promoting better quality primary school education and in ensuring that all children remain in the school system? Can foreign investors influence local Indian manufacturers to subcontract only to suppliers with acceptable labour standards? Can child welfare groups in the west work with their counterparts in India to develop community-based programmes? These non-governmental networks, rather than government to government programmes, may be the most effective means for promoting the international norms that are now still largely rhetorical.

CONCLUSION

With 90 million of its children outside the educational system, India clearly has a long way to go to build a mass human resource base that can contribute to its present efforts to move from the state-led autarchic industrialisation policy to a market-oriented model in which India competes in a global economy. Though India has begun its reform process by reducing tariffs, opening its market to imports and to foreign private investment, permitting market exchange rates, and eliminating licensing and price controls, the country still has a considerable way to go before it has an economy capable of effective competition. The government has not moved toward the privatisation of the public sector nor developed an exit policy that would

enable new investors to expand employment without fear that the government will prevent them from dismissing workers. The middle classes support reforms, but since they have been shielded from the world economy by the protective apparatus of the state that has been in place for more than 40 years they remain reluctant to support all the measures necessary to bring the country into the global economy. Least of all do they show signs of embracing the idea that a mass human resource base is, in the long run, essential to create the literate labour force necessary for a competitive economy.

On educating its children India remains so behind the rest of Asia that it will take a major infusion of resources and political leadership to catch up. Tariffs can be lowered quickly, taxes reformed, and deregulations can easily be put in place, but building a national primary school system, making education compulsory, and removing millions of children from the labour force will take time. It will also require a level of commitment from government and from groups throughout the society that India does not yet have. The argument of this paper, almost too banal to assert, is that change has to come from within India and that the outside world can play only a limited role. India adopted its new economic policies not because Indian intellectuals and officials saw they were falling behind east Asia, but rather because of an internal financial and balance of payments crisis that persuaded them that the existing state-led industrialisation policies had put the country into near-bankruptcy. Indians have not yet realised that they have also paid a heavy price for failing to bring half of the country's children out of the labour force and into the educational system. Deep class/caste divisions have been barriers to the development of a national drive for mass education by those who have made it to the upper strata; the political tendency in India has been to pull up the drawbridge once one has made it across, rather than to lend a helping hand to those who have been left behind. As the economy opens and employment opportunities grow with the expansion of the country's consumer industries, the governing middle class may recognise that the country needs a more literate population and therefore must invest in its children. But it will take a major coalition of locally based groups, the active participation of the media, the contribution of researchers and the information they disseminate, the support of investors, educators, social activists, and trade unionists abroad, and international donor agencies to get India to address the way it treats the children of the poor.

Women and Work

From Housewifisation to Androgyny

Susan Visvanathan

Unlike hermaphroditism, which is a lack of physical differentiation, or bisexuality, which is a lack of clarity in gender identification, androgyny expresses a conscious interplay of masculine and feminine aspects of the individual psyche. The article attempts to understand androgyny through the works of Philomena-Marie when she is actively engaged in mobilising the Kerala fisherfolk against the encroachment of the big trawlers.

I

CAROLYN MERCHANT, Claudia Von Werlhoff, Maria Mies and Ivan Illich have argued forcefully that capitalism has rendered woman a captive of the house. The labour of housewives goes unnoticed as shadow work, they are not seen to be part of the economy.¹

These authors have argued that in capitalism, women were seen as belonging to the domain of nature, and were to be broken, tamed, cultivated and civilised. Women who experiment with healing, agriculture, emotion and war were punished. Science and exploration were male domains; women could not innovate. Notions of order were defined for them, the subduing of women's nature was the greatest expression of the hierarchy of gender. The housewife is the transformation of the creative energies of women into one systematic type of labourer, one who is concerned primarily with reproduction, i.e., the birth of new members for the labour force, and their sustenance and nature. This labour does not create surplus or capital, it cannot be sold on the labour market. It is, as one feminist has argued, love and responsibility.² These are not in capitalist patriarchal ideology things of value, for value only arises from profit in the market. So the histories of men are visible (Joan of Arc and the Slave Queen dress as men) while women constitute simply, a sex.

In a plea for return to motherhood and work, feminists like Sylvia Hewlett tried to handle the question of what gender neutrality actually entailed. While women enter the professional world (or the labour market) on an ostensibly equal footing with men, the domestic space still represented traditional hierarchies and differences. Women bore children, cooked and cleaned, while men controlled property, women and children. Both men and women went out to work, but women's earning were a 'second' salary. Their official roles were continuing in a gender-defined way, but their commitment to the codes of work had to be neutral. Their actual involvement in the powerful roles in a society were seen to be negligible. What one required as a concomitant to gender neutrality of social roles at the work space, was gender neutrality in the domestic space. This would involve the socialisation of young children, so that work allocation is not gender

specific. Boys as well as girls must be trained to cook, clean, wash, shop, rear children and earn. This was work, not 'women's' or 'men's', but work that needed to be done in a shared and reciprocal way.

Why were women alienated from the control over productive processes although it was they who sustained the manpower required for the market? Women were seen to be objects of nature to be dominated rather than worthy of egalitarian interaction. They were the bearers of children, they made things grow, they understood the cycles of nature within their own bodies. By excluding women, men externalised that from which they themselves were born, that which had to be a part of them.

Michelle Rosaldo (1974) underlines the fact that in most societies women may have power, but men usually have authority. Authority becomes a veil which separates and distances men so that they can control interactions as they wish "...by avoiding certain sorts of intimacy and unmediated involvement they can develop an image and mantle of integrity and worth". The 'natural' attributes of womanliness (ascribed status) is contrasted to the achieved status of 'becoming a man'. Because women are excluded from the domains of rationality and power by cultural stereotyping, they appear as other. Women's status, Rosaldo argues is achieved from their stage in a life cycle, from their biological function, and in particular from their sexual or biological ties to particular men. For Rosaldo, the two extremes of this position can be seen in the witch, who sleeps with the devil, and the nun who is the bride of God.

Carolyn Merchant (1979) shows how western science domesticated nature (and women) through the questions and methods of science. The earth was transformed from the image of a nurturing mother into a source and potential for economic interest. The disorderly elements of female nature would be subjugated, and women became passive dependents in both production and reproduction. Even today, the exclusion of women from knowledge about their bodies, their isolation in labour as if pain was demeaning and infectious is representative of a scientific objectivity as opposed to empathy and subjectivity as experienced in traditional assistance at child birth.

Nature and culture in such a perspective were no longer categories in relationship, but were now dual, external, divided and antagonistic. It was a fair description of the relationship between the sexes. Women, being identified with nature, became associated with animality, just as were indigenous people in the colonies. Thus women, the enslaved and animals all belonged to one class. Hannah Arendt (1958) writes that women and slaves were homologous because they were hidden away, belonged to someone or another, and their life was 'laborious' and devoted to bodily function. Arendt argued that the chief function of 'labour' is the production of life and therefore labour is associated with procreation. However, the least durable are those things which are needed for consumption, for life itself. If not used immediately by men they perish. Therefore, the daily labour of women which contributed to subsistence was not inscribed in memory. Arendt said that work – what men did – was different, for it transformed things from matter into material, from nature into culture, and was associated with the hands, with skill and knowledge, rather than with the body.

Why then is labour, life generating as it is, associated with passivity? Carolyn Merchant for the history of the west, and Leela Dube (1986) for India, have shown that women are associated with the earth who bears and nourishes the seed, which is the vital, life generating active principle. Corporeality, substance and matter thus, in patriarchal societies derive from the female – therefore also putrefaction and mortality, but quickness, the mind, the soul, cerebrality is passed through the male. The passivity of women is continually reconfirmed through men's language. Dube argues that a woman is alienated from her productive resources (like land, she belongs to someone) and has no control over her offspring. Illich (1982) would call gender neutrality fatal to the women's issue. What was required was complementarity, argument, conversation and understanding: in Buber's (1970) terms the 'I-it' relationship characterising the subject as masculine and dominant. The object as female and passive should be substituted for an I-Thou or I-You relationship whose language is tempered by dialogue. As Anna Kingsford, one of the early

feminists, maintained that women when kept back from articulating and achieving dialogue were deformed, and in such a case, the men lost out too, for one sex cannot be handicapped without the other suffering [cited in Matland 1896].

Virginia Woolf's novels became an interesting exercise in articulating the theme of the suppression of women's work capacities. In *The Voyage Out*, Rachael's passion and proficiency in music while acknowledged may not be professionally used. Hewet, the most sensitive and gentle of men, believes that Rachael becomes "less desirable as her brain began to work". Hewet argues that women see men as horses do. "They see us three times as big as we are or they'd never obey us". In the end, Rachael must die – she represented the classic constraint upon individuality and being that masculinist societies imposed upon their women: talented and unprofessional, dying in the small cabins spaces that society provided for them. *A Room of One's Own* (1945) became a symbol of private space and autonomy, where women could find their own sense of being, write a new history of actions and events. I will not go into an analysis of Woolf's work here, except to mention that in *Orlando* Woolf destroyed this conception of women's being as conventional, peaceful and consensually embedded in patriarchy. She substituted a male-female figure who so light-heartedly, so brilliantly destroyed and ravaged all notions of women's being, transformed roles and rules, work and custom.

Woolf's work explored two central ideas about women and consciousness. One was the idea of androgyny. In *A Room of One's Own*, she playfully and poignantly sketched a mythical account of Shakespeare's sister Judith, as talented as her sibling, but fated to die and remain anonymous for she was a mere woman. She also spoke of the only possible way for women's emancipation – it was a plan for the soul. "In each of us two powers preside, one male, one female, and in the man's brain, the man predominates over the women" [Woolf 1945]. Where there was harmony between the two forces, spiritual co-operation, a fusion, the greatest creativity is possible. While Woolf herself was housewifed and sanatorium-ised, through the character of Septimus Smith, in the novel *Mrs Dalloway*, she tried to show that God and nature speak in many voices and some have the gift to hear and understand. Her portrayal of Orlando became a powerful exegesis of the concept of androgyny.

June Singer (1973) in her valuable interpretation of Jung's work argues that there is a natural biological opposition between men and women which is the basis of creativity. She develops Jung's notion of the anima and animus to underline that every man has a feminine side, every woman has a masculine side, which are rendered unconscious by culture. The repression of

the anima (in men) and the animus (in women) creates both the longing for the other, as well as the awe, fear and incomprehensibility associated with the other [Singer 1973:234].

The cultural stereotyping of emotions would then possibly end. Jesus, for instance, as a man, had no dilemmas about articulating a theory of love and care. Interestingly, though, C F Andrews who imitated Jesus in many ways, was thought to be effeminate by some. June Singer writes, "I think it must have been the anima of Christ that urged him to seek out that one lost sheep" (1973:234).

Further, Singer writes, "unless we are partners with that contrasexual side of our nates, the soul that leads us to our own depths, we cannot become full and independent partners with a beloved person in the world outside" (1973:268). It allows us identification with others and what Jung called the self.

In her later work *Androgyny*, Singer distinguishes between various terms in order to define what androgyny really is. Neither hermaphroditism, which is a lack of physical differentiation, nor bisexuality which is a lack of clarity in gender identification, the Jungian concept of androgyny expresses 'a natural unforced and uninhibited (male or female) sexuality'. Yet, neither tends to extremes. Men do not need to exude machismo, or women to pretend a naive and dependent character. "Excessively polarised personality types" according to her thrive in cultures which demand repression of natural tendencies. Androgynous individuals lift these repression "not in order to prepare a way of living out sexual impulses so much as in order to permit what has been repressed to return and to be reintegrated into conscious awareness" (1977:19). Consider Woolf's classic experience of an androgynous state, which Charissa Dalloway feels, "a match burning in a crocus, an inner meaning almost expressed". It is a revelation which allows her to "then feel what men felt". The androgyne consciously accepts the interplay of the masculine and feminine aspects of the individual psyche [Singer 1977:21].

In a stunning critique, 'Against Androgyny' Jean Bethke Elshtain (1987) demolishes arguments in favour of the concept showing how androgyny in feminist discourse has removed the mythic frames of the term. She believes that the presence of difference within the human frame has always been a cause of vexation (!) but that in the feminist discourse on androgyny, the fused body disappears. I think Jung's basic contribution is to reorganise the body in terms of the conscious and the unconscious which Singer celebrates and Elshtain completely ignores.

II

I will now look at a specific case in order to understand how androgyny is a useful exercise for understanding women and

creative work. I take the specific case of a woman, a Christian nun called Philomena-Marie who led the fisher people's struggle in Kerala in 1984. This has been dealt with elsewhere [Visvanathan 1994] and I provide the bare outline.

In Kerala, the fisherfolk's struggle against capitalists ravaging of the sea has drawn tremendous strength from Christianity. (Some of Jesus' best friends were after all fishermen – Peter, for instance, whom we know as Cephas.) Most of its current leaders have church background, though there are internal contradictions. The struggle is against the capitalists and their trawlers which ravage the sea, over-fishing the waters, using destructive purse-seine and trawl nets without any regard for spawning seasons or ecological balance. In this sense, the sea is merely a commodity base. The fisher people contest this indiscriminate fishing and have been ceaselessly organising protests, without much success.

Philomena-Marie is outstanding in this struggle for her sheer insistence to martyr herself for the cause. She took on the state, the capitalists, the church establishment. She was jailed in the summer of 1984, and soon after, began her 23-day fast.

After studying the participation of the radical members of the clergy in a trade union movement, the bishops of Kerala resolved that fast unto death was not permissible as was participation in protests culminating in violence. The Christian community was warned against supporting radical slogans, and dangers to their faith.

Philomena-Marie was forced to call off her fast, but she never lost her will to help the fisherpeople, to lead them in their agitations and to co-ordinate their work. In a speech in 1990, she said, "When human rights are trampled, no one can stay neutral. Neutrality on such occasion is equal to a crime. From the experience of the struggle we learn that justice is not given but taken by the concerted effort of the people concerned. The church by her neutrality, is supporting the existing political and economic system. When we struggled with the people, ever ready to give up our life, the bishops could see only disobedience, violence entering into politics. The boat (trawler) owners go with the blessing of the bishop. When poor people fight for their rights, they will be characterised as communists and naxalites. The church can only understand charity and distribution of bread" [cited in Visvanathan 1994]. How does one understand the power of this woman, and her active involvement in the fisherpeople's struggle? The last part of this essay looks at androgyny, celibacy and dress to understand how a woman becomes an active leader, a symbol of the fisherfolk movement which cuts across religious divides and becomes a forum for human rights and safety of the sea.

III

Philomena-Marie is a woman who has given her life to Christ. The complexity of the relationship is implicit. She is certainly one of the 'wise-virgins'. This reminds us of one of the poignant stories Jesus told: the parable which highlights the joy of women who waited for their bridegroom in a state of preparation in comparison to the anxiety and trepidation of the virgins who were disappointed because they were not ready to meet the lord (*Gospel of Mathew*, ch 25, pp 1-13). However, spiritual marriage is about the meeting of the soul, and the understanding of the self and other. The metaphor of marriage is used in order to understand the intensity of desire. But when we say 'virgin' and 'bride' we are speaking of a consummation that is yet to come. In this sense, death presents the face of virtue, for it offers the vision of resurrection and the union with the beloved.

Complexity is not in the love metaphors of religious union, for these are to be found in all societies, but in the concept of androgyny. For Jung (1978), it represented fusion of characteristics associated with masculinism and feminism in such a manner that it would create the whole being. It articulated the idea, quite familiar to us now, that psychological characteristics had social and archetypal undertones, and that the development of one or the other, was the basis of gender typing. How then could one use one's energies, psychic or religious in the most creative way? One sees the answer clearly in the life of Jesus. I will not consider physiognomy of Jesus because his represented face is the desired face of western heterosexual norms: he is always poignantly beautiful. But let us look at the androgyny of his nature – a child who is presented with gifts of perfume and gold, who is identified with the gentleness of pastoralism, and the careful art of carpentry, which combines both physical strength and contemplative concentration. Jesus grows up as friends of fishermen and prostitutes, rich men and tax collectors; is often with women and children; is light enough to walk on water, capable of great and ferocious anger; he weeps quite openly, teases his mother; he cannot bear pain and humiliation, and asks God, who is another form of his own self, to take away the bitter cup. Weak and defenceless as he is before his father, he is quite different at the courts. Jesus, then, cannot be stereotyped. What are the sources of his strength, his imagination (for he is always telling stories) and his courage?

Perhaps they lie in his mother from whom he is corporeally constituted, since apocryphally Joseph is only his foster father. If Jesus is physiologically and perfectly created, but in a godly way – for 'in the beginning was the word' and then 'the word became flesh' – we clearly are at a loss if we should search him merely corporeally.⁴

The androgyny of his being does not question the right he has to his manhood; it only states that while being a man he could understand and empathise with women as much as with the Centurion's daughter of Lazarus, or the lepers, the blind or Zachariah, who was always so ashamed. For centuries, this empathy, this understanding of the other in the essence of his being or her being, has come down to us as the concept of love. This love however was culturally specific – it was not sexual (though the intensity of desire communicates itself in the story of Mary Magdalene) but appeared in the form of wisdom and peace. Jesus would, through the symbol of his life and death, and the visions his friends had of him, define the intensity of spiritual existence and experience.

When Philomena-Marie leads the fisherfolk, she symbolises the woman she is, a follower of Jesus, a bride of Christ. However, she also leads the fisherfolk, not because she is a woman, but because she understands the rules of parapolitics, of capitalism and profit, of the servitude of the declassed. In that sense, she does not stand in for the bride of Christ – she is an office member of the KSMTF. She understands her job, she is highly qualified in management theory, her rhetoric does not carry any of the tones of gender or religion. She could be either male or female, nun or priest, Hindu or Christian [Visvanathan 1994].

One of the problems is of understanding work which neutralises gender. In the unbridled years of feminism when women pitted themselves against male bastions, it was important to believe that same is equal to equality. Yet, in recent issues of *Feminist Review* and *Signs*,⁵ some of the most poignant reviews have been about lost identity – what happened to motherhood, being and celebrating womanly selves; did being a woman mean hating the 'other'; how would one then look at complementarity and the division of labour? In a brilliant indictment of maleness and the right to die in war, Genevieve Lloyd⁶ argues that heroism is for men, and in war they transcend their love of life for the rationalist ideas of justice and freedom. Women, however, it is believed, cannot overcome nature, or transcend death, because their role is to reproduce. Freedom and consciousness then are male preserves, but when a woman sacrifices her sons, then she overcomes nature and becomes a citizen (like the Spartan Mother who does not weep for slain sons, but rejoices in the victory of her country at war).

Androgyny means overcoming the cultural parameters defining a man or a woman, and raising the issue of common humanity. Work then is defined in terms of ability and interest, and the distinctions between men's work and women's work would at once be devalued. Androgyny, then, is about fearlessness, and role choices which are not biologically defined. Anthropologists are familiar with instances of role reversal which

augment clearly enough the cultural reasons for demarcating work as gender specific. Androgyny is not about bisexuality or hermaphroditism. It is not about transvestism though the latter becomes an important code by which androgyny often articulates itself. One of the complexities of androgyny could be substitutability, which sociologically is not a problem when applied to role behaviour. Substitutability is usually about roles and not persons. It argues that the case for resemblance is so high in tribal society that one tribal is like another, one factory worker is like another, though levels of skill or biographical characteristics may hugely vary.

So if Jesus is androgynous in the Jungian sense, he only articulates in his person and character true consanguinity. Biologically, we too are of cognatic descent, but socially we may be patrilineal or matrilineal in our societal and individual self-definitions. Each of us is composed of father and mother in a genetic composition that is structurally universal, except in the case of mutation. Androgyny celebrates the differences and similarities in being human.

The case of Jesus is problematic because his relationship with his father is philological while with his mother is corporeal. His father is God, but his mother only a saint. It is this cultural hierarchy that allows Tom Kocherry (another KSMTF leader) to be like Jesus, but Philomena-Marie cannot. She must remain an (androgynous) woman.

The most interesting thing about androgyny is that it does not necessitate gender neutralisation. In this context, let us look at Joan of Arc.⁷ I shall draw my story from Marina Warner, Tom Keneally, Bernard Shaw, William Shakespeare, though this is a small cluster in the milky way of researches done on Joan.

Joan constantly refers to herself as the maid or the virgin. What she conveys most stridently is the preparation for consummation, the virgin sacrifice by fire. She must die so that her country may be liberated. What is significant is that Joan does not menstruate – her 'womb is dead' – therefore she cannot conceive, but conceive only the deed or word or value. In this sense Joan, Mary, the virgin mother, and Philomena-Marie are homologous. Philomena-Marie achieves the fertility and power of the word through celibacy.

The works of celibacy are well known through the lives of saints in all religious traditions, and specifically, through the life of Mahatma Gandhi. Sexual energy, in Jungian terms, is transformed into energy required for self-realisation or political battle. Celibacy, like androgyny is about the consciousness of one's own sexual identity, and the pain or glory that arises from transcending or overcoming one's biological and psychological and social drives. Joan understood this well: she was for the French a saint, the maid, the virgin. For the English, she was a whore who led a dissolute life,

Institute of Rural Management, Anand

Chair Professors In the areas of Rural Economics, Agricultural and Rural Marketing, Rural Finance and Development Management

The Institute of Rural Management Anand (IRMA) was established in 1979. It provides management education, training and research support to rural organisations, especially in the co-operative and development sectors. IRMA offers a two-year Post Graduate Diploma Programme in Rural Management (PGDRM) with specialisation in Agri-Business/Development and several long and short term management development programmes which attract participants from India and abroad. IRMA faculty are also involved in managerial and policy research relevant to rural organisations.

IRMA is currently looking for outstanding scholars and practitioners for the following chair positions:

1. RBI Chair in Rural Economics
2. NABARD Chair in Agricultural & Rural Marketing
3. Bank of Baroda Chair in Rural Finance and Management
4. State Bank of India Chair in Development Management.

The applicant should have a doctoral degree or an equivalent professional qualification/work experience in senior management positions and a good record of research and publications. The Chair Professors are expected to undertake research of highest quality and visibility. The selected scholars will head the respective chair units which have the requisite research and supporting staff and other modern facilities.

The selected scholar will be placed either in the pay scale of Rs. 7000-8000 or Rs. 5100-7300 depending upon his/her scholastic achievements. Other perquisites include campus housing, provident fund, superannuation, gratuity, medical benefits, group insurance, leave travel concession for self and family, campus schooling for children and children education allowance. IRMA offers an excellent academic environment in a modern, beautiful and well maintained campus.

There are also **Faculty Positions** available in the scales of pay ranging from Rs. 2200-4000 to Rs. 5100-7300 in the areas of Finance, Strategic Management and Business Policy, Marketing, Agri-business, Cooperative Management, Rural Sociology/Anthropology, Business Law, Computers and Management Information System, Development and Environment.

Interested candidates may apply with complete bio-data, copies of a sample of their publications and name and addresses (with telephone numbers) of three referees to the Director, Institute of Rural Management, Post Box No 60, Anand 388 001, Gujarat.

Phones: (02692) 40177, 41230 Fax: (02692) 40188

lay side by side with soldiers, a transvestite who used a war to glorify herself. Most stories about Joan recount that men were afraid to touch her, that they never wanted to touch her. Her virginity, her celibacy, her virtue, her 'integrity' became the symbol which a ruptured France could heal. No wonder then that celibacy and androgyny can combine, as in the case of Joan of Arc and Philomena-Marie.

Any reader of the texts of Jesus would immediately understand the *advaitic* power of 'I am the Way, the Truth and the Life'. It is, as Ivan Illich says, "'I is never gendered' because I is from the oral tradition" [Cayley 1992]. The listener knows immediately from the voice what the gender of the speaker is. In this sense, Christ's sayings do become patriarchally defined. Thus, Philomena-Marie knows that she can be a friend of the fisherpeople as much as Jesus. But established patriarchal conventions will not allow her to take the place of Christ.

Not surprisingly, she is locked up in prison for trade union activities with the prostitutes. "We prayed with them, made friends with them, shared their troubles". It is a symbiosis of role identity with Jesus, impervious of gender. The newspapers scream, 'Nuns have been locked up with *vaishyas*'. For Philomena-Marie, "the courage and love of Magdalene is the unarticulated theme of her compassion, which links celibacy with profligacy and makes the latter redeemable".

Joan, on the other hand, hated prostitutes and chased them out of the camps. Legend has it that the sacred sword that won her victory at Orleans broke on the back of one such prostitute, which was followed by her defeat, capture and death. For Philomena-Marie, prostitution, like alcoholism, is an occupational hazard arising out of the frequent economic crises in the lives of the fishers. What is important is to provide alternative modes of employment to women.

Joan dressed as a boy was burnt at the stake for it, because this was a role reversal, contrary to nature and so heretical. Yet, dressing as a boy meant that she could ride to war. Philomena-Marie dressed in indistinguishable fawns, dull browns, neither merges with nature nor does she stand out. This is in contrast to the brilliant hues of the fisherfolk. Her clothes mitigate her gender (they do not neutralise it or transmute it) because these are the colours one would associate not only with renunciation, but also with bureaucracy.

So in a world of men, Philomena-Marie plays out her vocation. She is unafraid of prelates, capitalists, governments and death. She is thin (anorexic in the new equations between fasting and visions) and overworked. She oscillates between many roles. She nurtures a boy (married at 18), his wife and child because they cannot quite manage on their own. She races between villages, providing medical help. She keeps the KSMTF office in order. Earlier she stayed

with a woman whose husband had died at sea, and helped her reorient her life. Sometimes she gets thrown out of a Sunday school classroom because the visiting prelate sees her trade unionism as a bad example to young children. She eats her food with co-workers (nuns from a nearby convent) or with an office bearer at the KSMTF. She says, "We are networking with other movements. We are in touch with Medha Patkar." There can be no competition or jealousy in the emulation of saints; there can only be patience and reservoirs of heroism which sees martyrdom as the true androgynous term. This paper does not ask for martyrdom but asks to listen to the voice of the potential martyr and respond to the commitment to the cause, to be sensitive to the person who fasts, has visions, rebels, hears voices, and see in the androgyny of his or her being questions we need to really ask ourselves about what it means to be human.

Notes

[Fr George Keeran, S J; Fr T K John, S J, Fr Gispert-Sauch, S J, Fr Raja, S J; Fr Paddy Meagher, S J for insisting on my involvement in feminist issues in 1990. I must also thank Harish Trivedi, Shiv Visvanathan. The first part of the paper was written at length for an inaugural lecture at the Jesuit Scholasticate, Vidyayothi in 1990. The second part on androgyny was written for an NMML seminar held in 1994.]

1 Susan Visvanathan, *Housewifisation and Women's Rights*, 1992 (a review of literature), Ivan Illich, *Shadow Work*, 1981; Gender, 1982; Carolyn Merchant, *The Death of Nature*, 1971; Maria Mies, *Patriarchy and Accumulation on a World Scale*, 1986; Maria Mies, Veronika Bennholdt-Thomsen and Claudia von Werlhoff, *Women: The Last Colony*, 1988.

2 Sylvia Hewlett, *A Lesser Life*, 1986.

3 How terrible is the envy that Woolf feels for those male citadels into which women had no entry. In *Jacob's Room*, the contempt for women is well recorded. "No one would think to bring a dog into church, a dog destroys the service completely. So do these women - though separately vouched for by the Theology, Mathematics, Latin and Greek of their husbands" [Woolf 1984: 30]. *Night and Day* chronicles a greater resolution of the conflict between women's roles and work, between marriage and occupation. Work cannot yet be a career, but there is a greater celebration of cerebral endeavour and to some extent masculine adaptation to feminist strivings. Katherine Hilberry, in this novel, is a secret mathematician. "No force on earth would have made her confess that. Her actions when thus engaged were furtive and secretive like those of some nocturnal animal." It is Jacob, of *Jacob's Room*, who is the inheritor of history, architecture and learning - also of war and death.

4 The sources of this interpretation are people's narratives amongst a practising Christian community in Kerala, see Visvanathan (1993).

5 Ann Snitow in *Feminism and Motherhood* has paradigmatised the shifts in feminist thinking from the separatism of the 1960s to the anti-motherhood manifesto of the 1970s. Finally, she says, "In the 1980s we have apologised

again and again for ever having uttered what we now often name a callow, classist, immature or narcissistic word against mothering... We have embraced nurturance as an ethic, sometimes wishing that men would share this ethic without much hoping they will" [Snitow 1992: 42].

In a completely different vein, Prue Chamberlayne analyses the emergence of *The Mother's Manifesto* and disputes arising out of it. The manifesto was issued by women who were a part of the West German Greens in 1987. Their demands 'include collective provision for child care, a revision of urban design, pay and pensions for home careers, flexible employment, increased leisure time and the facilitation of political activity for mothers'. According to Chamberlayne, many feminists believed the manifesto was reactionary and could even mean a return to Nazism, presumably to kitchen, church and kindergarten. The *Manifesto* reflected the disenchantment with individualistic, capitalistic, competitive values which deny biological spaces to women. The debates on caring have become centre space. German feminists echo the anguish of Ivan Illich, that gendering has led to greater inequality, that participation in the labour market has led to greater violation and loss of autonomy for women [Illich 1982; Chamberlayne 1990: 10-11]. The sadness of the *Manifesto*, it seems, lies in that it wages an assault on non-mothers, in a way that was waged by women against men, or men against women in earlier years. German feminists like Giselda Erler say that as mothers they feel 'marooned', relegated to a reserve as guardians of a dying culture. Mothers must be returned to the centre of societies, the quality they impart to life of sharing, intimacy, uniting of body and soul, which have been destroyed by 'reason' must be valued once more. In the same way, such feminists do imagine the development of a new male tenderness and responsiveness through intimacy with babies, as well as a rediscovery and extension of eroticism in experiences surrounding reproduction [Chamberlayne 1990: 11]. There is therefore the possibility of the transcendence of existing gender roles; and yet the retention of differences.

Joan Tronto analyses Carol Gilligan's famous theory of care as being both situated in women's experiential morality as well as transcending difference. Care, therefore, centres around responsibility and relationship rather than rights and rules; it is concrete rather than abstract; it expresses itself in activity rather than in theory, engaging in 'daily' experiences and moral problems of real people in their everyday lives [Tronto 1987: 648].

What about 'caring' or pro-feminist men? Lynne Segal, in her essay *Feminism, Socialism and the Problem of Men* (1989) quotes Jonathan Tonstram, who was an active participant in communities centring around socialism and women's rights. "I feel it is vital for men to be more closely involved in child care if patriarchy and male violence is to begin to crumble. And that, however bleak our immediate political prospects, one thing that can happen now is that men can change" [cited in Segal 1989: 31].

Segal demands an analysis of masculinity which she feels is an area of conceptual deprivation. There are many different kinds of men and masculinities - gay, straight, gentle

and tough, democratic and authoritarian – and these are all cut across by race, class, ethnicity and religion [Segal 1989:15].

That feminist experience contributes to theoretical wholism is a point made over and over again [Haug 1992:16]. But Mary Louise Adams in her essay *Identity Politics* (1989) argues that personal experience was used in the feminist cause as a means to liberation, but it should not cut feminists off from larger struggles. Similarly, Sally Alexander (1991) states that the first wish of feminist history to uncover new meanings for femininity and women, to propel sexuality 'to the forefront of the political mind' was very similar to the goal of psychoanalyses. The latter attempted the discovery of a subjective history through image, symbol and language. She asserts that psychoanalyses and feminism arose together. (I would even assert that early critiques of Freudian psychoanalyses came from feminist novelists like Virginia Woolf, as *Mrs Dalloway* and *Orlando*, clearly show.) Alexander argues that psychoanalyses preferred to focus on the mother-child relationship while feminism went into the debates about the rights of 'workers' and 'citizens', the rights of women in the public sphere [Alexander 1991:128-133].

In this pursuit of questioning 'normality' feminists like Sheila Rowbotham have critiqued the concept of the good or 'normal' mother in an essay called '*To Be or Not to Be*' (1989). She asserted that feminism's main contribution was to show that happiness could come from other things than mothering. Feminists came out honestly with their feelings, to show that motherhood could be both oppressive or liberating, it was feminists who articulated the belief that "motherhood must be freely chosen and socially transformed". Yet by the 1980s she concedes, with Liz Heron, that feminists were "melting into motherhood" [Rowbotham 1989: 84].

6 Genevieve Lloyd, *Selfhood, War and Masculinity*, 1986.

Virginia Woolf argued in *Three Guineas* (1938) shortly before the IInd world war, and her own despairing suicide that "as a woman, I have no country. As a woman my country is the whole world" [Woolf 1986: 125]. She insisted on a policy of non-participation where women would refuse to endorse war celebrations, activities or even discussion. She could only do this if she was economically independent, and further Woolf even pressed for wages for housewives. Marriage and motherhood, she argued, is a profession. She stated that women's work was as sacred as that of the clergyman who is paid without derogation. It is interesting to note that Woolf saw housewifisation and motherhood as creative possibilities of women's self-expression. She never excluded it as a profession. Mrs Ramsay in *To the Lighthouse* is a powerful person. It is in a seemingly corrupt and yet intensely intelligent figure like Charissa Dalloway (1915, 1925) that housewifisation with its boredom, its tragic loneliness is handled. The deprivation from work – the elite and languid body – is expressed here as the broken and diseased female body. Yet there is something resilient in *Mrs Dalloway*. What seems like corruption, an idleness enforced by society, becomes almost contemplative.

Mrs Ramsay in *The Lighthouse* on the other hand, merges with things. When she dies, everything becomes empty. The house, representative of an order that she sought in the world and in human relationships becomes

the symbol of emptiness. For Mrs Ramsay, the world was a hive, which captured the intensity and intimacy of conventional family relationships, where women were indeed so dominant and central [Lloyd 1986; see also Sandra M Gilbert *Soldier's Heart: Literary Men, Literary Women and the Great War*, 1989]. Gilbert shows how during the Ist world war, women began to play an unusually important part. Earlier they had been powerless, but now they were the great sacrificers – sacrificers of fathers, brothers, sons, sweethearts and husbands. She quotes D H Lawrence, "Why do the women follow us, satisfied/Feed on our wounds, like bread, receive our blood/Like glittering seed upon them for fulfilment". Further, she argues that the war meant that the women could join the labour force, and this was the first rupture with a socio-economic history that had heretofore denied most women chances at first class jobs...

7 Marina Warner's fascinating account of Joan of Arc focuses on her marginality in terms of social and political roles, and her clarity regarding her female biological identity. Warner writes, "the state of suspension, of indifferenciation achieved by a transvestite girl was confirmed by the Christian tradition as holy. Sexlessness is virginity's achievement and a metaphor for martyrdom, as hagiography bears out". Warner disclaims the "disorder of the androgyny of the neuter" in Joan's case (p 157). She says, "in holiness, androgyny is not neither this nor that, it is the fusion – and Joan belonged to this order – the absoluteness of the way, the impregnability to relativism, which means their sovereignty over time" (p 158). Warner asserts that Joan is the symbol of mobility, accepting neither her peasant birth, nor her female condition, or the limitations that would be a consequence of this (p 151). Having dressed as a boy, and while cutting her hair in the latest masculine fashion, Joan, yet, "never proclaimed herself a boy. Indeed, she never once pretended she was male, since she referred to herself in the feminine gender, as La Pucelle, the Maid" (p 151).

8 Marina Warner's term.

Defending the Dalki Forest

'Joint' Forest Management in Lapanga

Nandini Sundar
Abha Mishra
Neeraj Peter

This paper argues that the concept of 'joint' management of forests needs to be looked at historically in order to uncover the degree of state intervention in what are generally known as community forest protection schemes. It looks at various threats to sustainability of JFM in one village in Sambalpur district of Orissa, highlighting the fact that management for timber rather than merely protection by village committees is illegal. Thus, where community forest 'management' has been successful, it rests on the connivance in illegality of sympathetic forest officers.

IN 1948, a forest officer from Angul visited Sambalpur to watch Pandit Nehru lay the foundation stone for the Hirakud dam. He drove by a beautiful patch of sal forest and was impressed by the work of the local forest department. When he joined later in 1950 as DFO in Sambalpur, however, he was shocked to discover that the forest was not under his control, but belonged to the village of Lapanga. In 1993, 43 years later, there was still a tendency to assume that such a well protected patch inevitably owed its existence to the labours of the forest department. Another DFO happened to be driving by when a bulldozer belonging to Larsen and Toubro (L&T), knocked down seven or eight mature trees. Furious by the fact that this violation of forest land was being carried out 'under his own eyes', he immediately impounded the bulldozer, took away the trees and registered a case. Back in his office, he attempted to locate the precise reserve forest, only to discover that 'the forest was not his'.

A day later, the villagers got their act together and went to the forest office and demanded their trees back as the forest belonged to them. They did not make much headway with the ACF in charge, as the trees were a part of the evidence. L and T added to its sins by threatening to sue the forest department as the impounded machine was costing the company about Rs 3,000 rupees per hour in losses. However, after a week or so, the case was compounded, a fine was paid and the bulldozer returned. In the meantime, having failed to get the trees back from the range office, the Lapanga villagers 'liberated' one tree which had not yet been carted away, a magnificent specimen of Bijasal, (*Pterocarpus marsupium*) which they then auctioned in the village for about Rs 1,600. Completely oblivious to the problems involved in the forest department usurping the fruits of village forest protection, albeit saving it from further loss, the then ACF Rengali, sent a notice to the village that since the tree was already 'hammermarked' by the department, it had become government

property. However the village took no notice of the notice, and after a few feeble attempts, no further effort was made.

In 1968, when the people in Lapanga felt an acute need for funds to build a high school in the village, they approached the forest minister, who was also a resident of Sambalpur, and the DFO (territorial). The latter suggested that the money might be raised by allowing some trees to be cut from the village forest. The money required for the school was estimated at Rs 50,000, and a local Gujarati contractor hired to carry out the felling. About 150-200 large girth class trees were felled. The village received Rs 40,000 plus 2,000 as a personal donation from the forest minister. The school was built. It was only later that some people in the village learnt that the actual value of the trees felled was more than Rs 2 lakh. The money so generously gifted by the minister was from the same source and not from his personal funds. The DFO, the minister and the Gujarati contractor had obviously made a huge profit, while the village did not even get the full Rs 50,000. Discussing this incident with one of the forest officials recently, we learnt that the DFO and the forest minister had definitely bent rules by allowing the felling to take place. Even in a village forest, the village has rights only over fuel, fodder, etc, and the timber continues to come directly under the management of the forest department. Had a case been registered by the village committee, it would also have ended up being chargesheeted for being a party to the illegal felling.

What both these cases highlight are the constraints faced by a village which wants to protect its local forests. Appropriation by the forest department is only one aspect. The much touted history of forest protection in Orissa which is based on community management of forest, including rules regarding felling of trees for local use, is based on a fragile legal bedrock – in many cases what the villagers do, and what they are getting awards and increasing recognition for doing is illegal in the eyes of the law.

Joint Forest Management (JFM) then rests on the connivance in illegality of sympathetic forest officers. In this paper, we focus on the history of protection efforts by one village, Lapanga, in order to bring out some of the internal and external threats to sustainability for JFM or community forest management. We also argue that the concept of 'joint' management needs to be looked at historically, in terms of different modes of state organisation.

There are estimated to be more than 4,000 village committees, protecting about 27 per cent of Orissa's forest land [Poffenberger 1996:34-35]. Although Orissa was the first state in India to pass a resolution enjoining the creation of forest protection committees, the major thrust of protection in the state has been by self-initiated groups. In some districts like Sambalpur and Sundargarh, the majority of the forests thus protected are village forests on revenue land, but in other districts like Mayurbhanj and Dhenkanal, it is largely reserve forest land which has benefited from popular protection efforts. Some of these village committees are of relatively recent origin, others started in the 1940s and 1950s; while a few exceptional ones like Lapanga are claimed to date back a hundred years. The Lapanga village forest now covers about 700 acres and is popularly known as the Dalki forest, after a 'devi' who is said to eat anyone who enters it with destruction in mind.

Sambalpur conjures up an image of fringed, buffalo-bathing, women-washing ponds. The paddy fields are still lush even at the height of summer, just before the second harvest is cut. As one enters Rengali on the train from Delhi, the hills suddenly become greener – here and there one sees a patch of good forest. Enroute to Lapanga, we pass the reservoir of the Hirakud dam – travelling on top of the dike, past a sickly forest department eucalyptus plantation on its banks, towards some middling low hills. These yield to more protected patches, interspersed with dry fields and only an occasional clump of trees. Lapanga appears

in the distance – almost like a picture postcard – red tiled houses set amidst dense foliage.

Lapanga is a large village, with 12 hamlets (padas). It also hosts a post office, a vocational college and a branch of the State Bank of India. Out of a total of 358 households, little less than half (43.3 per cent) are landless labour, mostly from the scheduled castes (ghasis, gandas) or scheduled tribes (gond, sohra). Marginal and small farmers follow next comprising 26.5 per cent and 15.4 per cent respectively. Only six households or 1.67 per cent of the village could be classified as big farmers, out of which four are brahmin households. Castewise it is a heterogeneous village, with brahmins, sundhis, kulithas, kisans, gaurs, kewats, gonds, soharas, ganda, ghasis and mehrs among those in significant number. (See Table for full breakup).

The president of the Lapanga forest committee claims that when he was young, Lapanga was the most important village in the locality, far more than the block headquarters Rengali, which has prospered only owing to the government presence. There used to be an entire hamlet of sonars or jewellers, another specialising in bhattis or liquor outstills and so on. Once the Hirakud dam came in 1952, the face of the entire district changed. Two-thirds of the agricultural land of Lapanga was submerged. The former headman or gaontia too lost all his land, and after some years, left the village to live with his daughter in Bargarh. Faced with the loss of agricultural employment, there was a massive population efflux. Local labour left for Rengali or Bargarh which had suddenly become rich due to irrigation. Taking a walk through Lapanga today, everywhere one sees abandoned houses and roofs crumbling into disrepair. Sonaripara still retains its name, but it no longer glitters with molten gold being shaped – only a couple of sonar families are left. Conversely, there was an influx of oustees, or people from neighbouring villages who had been completely displaced by the dam. They now constitute an entire hamlet of their own.

INITIATING FOREST PROTECTION

Oral history suggests that protection has been going on for about 100 years. Tapaswani Pradhan, daughter of the last headman, Ratnakar Sahoo, a kulita by caste, says that protection started in the time of her grandfather, Sudam Sahoo. Since her father was born in 1900, this puts the date when protection was initiated somewhere in the late 19th century. Natwar Dhurwa who worked as jhankar (village watchman) of Lapanga from 1942 till the post was abolished in 1960, along with the abolition of the gaontia system, says his grandfather had been watchman of the Lapanga village forest for 32 years. Each household contributed 1

tami (approximately 800-900 gms) of paddy per month towards his wages. Whatever the accuracy of these accounts, the fact that protection has been going on for a long time is corroborated by the Hamid settlement records of 1927. It notes the amalgamation of 444.93 acres of village wasteland as well as some plots of private ryoti land, contributed by families in the village, into the Lapanga Gramya Jungle. Villagers say that the land that was given up was mostly unproductive, and that the families which contributed were among the richer agriculturists of the village, owning about 300-400 acres each. Parting with a few acres was thus not a problem.

In some versions, the initiative to start a forest protection committee separate from the normal panch, was taken by the gaontia, while in other versions, it was the contributing families which decided. However, there is no doubt that as the head of the committee the gaontia played an important role in sustaining the practice. The last acting gaontia of Lapanga, Ratnakar Sahoo, in particular, was said to be strict. The hereditary position actually belonged to his nephew hut due to the latter's youth, Ratnakar combined the positions of village headman (mukaddam), gaontia, and caste leader of the kulitas. In many parts of Orissa and the Central Provinces, especially in the former princely states, land revenue administration took place through village lessees called malguzars or thekedars, or through gaontias. *The Chattisgarh Feudatory States Gazetteer* (1909:10) defines the position of gaontia thus: "In each village an officer, who is called a gaontia, is appointed, whose duty it is to watch the interests of the state, collect and pay in the revenue and report on the condition of the village from time to time.

He is remunerated by the grant of some land free of rent and also cultivates the state lands set aside to provide supplies for state servants who may have to visit his village in the course of their duties.... A gaontia is usually elected by the body of tenants and is much looked up to by them. The post is not hereditary but in practice it usually descends from father to son". Unlike zamindars who had control over the forests in their area, and to whom tenants were usually required to pay some grazing and commutation dues, gaontias merely 'acted as a trustee on behalf of the government responsible to ensure that the village forest were used for community needs' (*Sambalpur Gazetteer*, 1971:347).

In other words, the system of revenue administration (which included the administration of village forest land) was 'joint', between village communities and the state, the person of the gaontia providing the link by acting as agent of both. Where the 'community' itself was settled by the gaontia – who was usually granted a rent-free period in order to extend cultivation into hitherto unbroken tracts – the opposition between 'community' and 'state' becomes even more slippery. The rules followed by the village forest protection committee, particularly the distinction between prajas and non-prajas, also reflect the rules in place in many zamindari areas, where landless labourers (thaluas/ thothas) were made to pay higher grazing and 'nistar' dues than ryots, on the grounds that they did not contribute through land revenue. Those engaged in non-agricultural occupations also had to pay according to the fuel consumed. Thus, in the 1930-40s, in neighbouring Phuljhar zamindari, blacksmiths who repaired implements paid Rs 4 as nistari

TABLE: NUMBER OF HOUSEHOLDS IN VILLAGE LAPANGA

Castes	Rich	Middle	Poor	Marginal	Landless	Total	Praja 'A'	Praja 'B'	Sukhvasi
Brahmin	3	9	2	7	–	21	20	1	–

Sohara	–	–	1	2	13	16	–	3	13
Total	6	47	55	95	155	358	107	110	141

dues, while blacksmiths who smelted iron paid Rs 6 [Kamath 1941:327-8]. In such a situation, perhaps one might argue that 'community' forest management may have been 'joint' forest management for much longer than one thinks.

MANAGEMENT RULES

During the gaontia's time, fuelwood from the village forest was free. A contribution was levied from all the landed households in the village to meet the expenses of the protection committee, the amount being proportionate to the land revenue or malguzari paid by the ryot. Today, the rules are somewhat different. All families are required to pay for firewood at the rate of Rs 36 for one bullock cart, Rs 2 for one headload or Rs 5 for one shoulder load (2 loads). For an average household this lasts approximately 4 to 5 days. However, the rates paid for timber for house construction and agricultural implements vary.

There is a three-fold classification of residents: praja A, praja B and sukhvasi. Praja 'A' comprise those who have land and whose ancestors were said to be involved in the initial protection efforts, either in terms of contributing their uncultivable land, and/or voluntary contributions of paddy proportional to their rent. This category is entitled to timber at the lowest rate. Praja 'B' residents are also landowners, but do not enjoy the lower rates for forest produce from Dalki. They are in the same position as the sukhvasi, who apply to the committee and buy the produce at the higher rate of 1.5 times the praja A rate. The third category are the sukhvasi or landless residents. There are also certain households which do not have land but are still eligible for praja A benefits. We assume that these households had land earlier (and had contributed in one of the ways towards Dalki management) but due to some reason or the other – for instance submergence by the Hirakud reservoir, or a large number of siblings resulting in increasing land fragmentation – gradually lost their land holding status. Conversely, even if a sukhvasi, due to change in economic status, is able to buy land in the village, then the rights to lower rates for produce from Dalki forest are not automatically transferred to the new owner. In short, it is solely descent from the original families which settled and protected the Dalki forest that entitles residents to lower rates for timber. The 10-15 original households have now expanded to 107, but they still comprise merely 30 per cent of the total population of the village. However, these families no longer pay for the upkeep of the forest, and currently all the expenditure of the forest protection committee is met from the sale of timber and fuelwood to both praja and sukhvasi. In one sense therefore, the Dalki

forest is managed as the private concern of a few families, for which other users are required to pay higher rates. The sukhvasi appear to accept the inequality on the grounds of original contribution, but also because the rates charged for timber from the Dalki forest are lower than the market rate.

The village forest committee which looks after the day-to-day management of the forest has approximately 10-12 members, from different castes, although with a heavy component of brahmins and kulithas. They are all male. A general body meeting (AGM) is held every June 15th at which the executive committee is formed and accounts are presented. In practice, however, few people apart from the prajas attend the AGMs. While the membership of the AGM is open to the entire village, only the 'praja' can be members of the executive committee. General body meetings may also take place at shorter intervals, for instance, when there has been a major theft. Since 1963, the presidents of the committee have been brahmins, except for two brief spells of two and three years respectively, when there have been sundhi and kulitha presidents. The presidents are changed every two or three years, apart from a long period when one person was president for 14 years.

The committee employs a forest guard throughout the year but in addition one or two members go on patrol occasionally. During September/October or the Dussehra period, the number of guards is increased to two, as it is a slack agricultural period, and villagers might then be tempted to 'turn their attention to the forest'. The guards get Rs 200 per month as well as 50 per cent of the compensation levied on any illegal felling. Anyone else in the village who discovers illegal activity also gets 50 per cent of the fine levied in compensation, which is an incentive for efficient patrolling. Sometimes the money involved can be quite substantial. In 1995, one of the guards got Rs 750 from one case alone. Officially, according to government rules, fines cannot exceed Rs 5. To get around this, the villagers levy 'compensation' according to the nature of the tree. The sale of timber and compensation levied are sufficient to meet the guards' income and household contributions for this purpose are no longer required. The forest protection committee also generates enough funds to assist in other aspects of village development, and unlike the panchayat which has to go through a bureaucratic procedure, the forest protection committee can release funds immediately. For instance, they used the money to repair their primary school. The middle school was entirely supported by the forest committee from 1960 till 1980 when the government took over; while the high school was maintained from 1975-1980. They also finance the Jagannath Rath

festival (June-July) in the village, the Shital Shasti (May), Chait Purnima (April) festivals and 50 per cent of the expenses for Dussehra. Expenses like the transport and subsistence costs of villagers who went to Sambalpur to ask the collector for a hospital are also borne by the forest committee. Besides taking over some of its tasks, the forest protection committee has no relation to the formal panchayat of the village.

The rules regarding who can take what from the forest are strict but transparent. Every individual in the village knows what they are. Outsiders are not allowed to use any commodity of the forest. Local villagers, whether praja or sukhvasi, are also not allowed to use wood or timber for commercial purposes, though they are allowed to collect (free) non-timber forest produce for sale, e.g. sal seeds and mushrooms. To gain access to timber for house construction or agricultural implements, villagers submit written applications to the president of the committee which are then passed to the secretary. There is a schedule of rates for different girths (2 or 3 feet) which is kept with the secretary. After the money has been deposited by the applicant, the committee consults with the forest guard and determines which tree is to be cut. Certain areas are demarcated for cutting every two or three years in a system that can be called 'selective rotational felling'.

The trees felled from Dalki do not cost as much as in the open market, but the labour and transportation costs from the forest to the village are high. For example, while the tree may cost Rs 1,000, the cartage (bullock cart) costs Rs 200 per trip. It takes about two trips to cart the main bole of the tree and another two trips to cart the 'lops and tops'. At least six men are required to fell the tree and saw the bole, remove branches, etc. for cartage. They have to be paid Rs 30 per day. There are the further costs of sawing the timber into the plank size required, which involves skilled carpenters. Secondly, sometimes the tree selected by the buyer turns out to be hollow, in which case the buyer still has to pay the felling and transport costs. However, in such cases the committee does not charge the timber rates and fuelwood rates/cartload are levied. The committee members claim that the demand is not very high, just 30-50 trees per annum, but they also do not have any system of confirming whether the tree will be hollow other than 'experience' and visual checks. The uncertainty regarding this and subsequent high conversion costs are somewhat prohibitive, and even if timber is easily available in the village, people do not buy indiscriminately. In addition, when an application is made, the committee members go to the applicant's house to confirm the need and actual quantity of timber required.

The efficacy of the forest protection is evident in the fact that the average height of the sal trees today is 35-40 m. One spectacular feature at the entrance to the forest is the 'Sat-gachia' – or seven sal stems growing from one root. It has become a religious site, despite having died last year. The committee has received several awards for its work, including the Jungle Parichalan Surakhya Award in 1976, which involved Rs 500 plus a certificate and the Prakriti Mitra Award in 1985-86 which gave them Rs 5,000 plus a certificate. It has also inspired some neighbouring villages like Gurupali, Khinda, Ghichamura and others to start protecting their own village forests, even though only as recently as 10-15 years ago.

However, there are several factors which mitigate the success of the Lapanga committee or which mar its potential future. The management practices of the committee are not adapted to the subsistence needs of all the villagers, and if they were all consulted equally, the resultant silvicultural practices might be quite different. The landless households in this area are heavily dependent on the collection and sale of non-timber forest produce – e.g. sal seeds, mushrooms, tendu leaves, and sal leaves – out of which leaf plates are made in Sambalpur. Yet, the committee does not allow any pruning of tendu bushes in the forest, which means that it does not generate new leaves as well. The villagers engaged in collecting tendu leaves (to sell for beedi leaves) are then forced to get them from elsewhere.

Apart from these discriminatory management practices and the inequity of the differential rate system between prajas and sukhvasis, there is the inescapable fact that much of the protection of the Lapanga forest is at the cost of the neighbouring Moulabhanja reserve forest. The poorer residents of Lapanga, both men and women, generally go to Moulabhanja for their personal fuelwood needs, or cut wood from trees on private lands when the owner is not looking (as told to us by some outraged households). However, they all deny that there is any headloading for commercial use by Lapanga residents, as the landless and marginal households find fishing in the nearby reservoir more profitable than headloading. However, many of the landless or marginal farmers in neighbouring villages are engaged in head loading from the Moulabhanja reserve forest, the smuggled firewood and even timber being taken to Sambalpur on the trains that cross Lapanga. According to one estimate, about 200 headloads arrive daily in Sambalpur from the general direction of Rengali range.

Several of the Praja families in Lapanga also buy their fuelwood from headloaders

at Rs 40 per shoulder load, which works out to 40 kg. Although fuel from Dalki is available at Rs 5 per shoulder load, this is not fuelwood in the strictest sense but brushwood like twigs, broken branches, etc. Fuelwood is available from Dalki only when trees are felled, and not throughout the year. The main bole is taken by the buyer for timber purposes while the 'lops and tops' are used as fuelwood. Hence the main source is shoulderloads from Moulabhanja headloaders, consisting of wood chopped into 'chulha-size' pieces from much larger trees or branches.

Conversely, large-scale felling by the forest department in the Moulabhanja reserved forest has significantly reduced this option, shifting demand to the Dalki protected patch. Pressure on both the reserved forest and the Dalki forest has increased since the submergence of over 2,000 acres of agricultural land by the Hirakud dam. Whereas earlier people would fell trees from their private agricultural land, rather than pay the committee to extract timber from the protected patch, this option is no longer open to them.

Above all, there is the constant threat of the forest department deciding to enforce rules strictly, which would negate the space for community management. The longest serving president of the forest committee described to us his constant fear of losing his government job as a school teacher, since he was required to sign the applications, and felling trees from Dalki for community use was, strictly speaking, illegal. Never mind that if the villagers had not protected the patch, there would have been no trees at all. The result was that the villagers would quickly fell the tree, and hide it in the village.

He then made several visits to the local DFOs and even bought a copy of the forest rules and studied the revenue laws. Successive collectors were invited to the village, and made complimentary comments in the visitors' register. In 1979, even the forest minister, Natwar Pradhan, came. Despite the awards, despite being aired on television from 1983-85 as part of the Orissa government's tree planting and environment protection promotion campaign, the villagers are not confident that their forest management system is really in their control. In another village in the same district, a Van Samrakshana Samiti was set up on the basis of an already existing committee. However, when a new DFO saw the villagers cutting trees according to their committee management rules, he immediately confiscated the timber and fined the villagers. Disgusted, the village decided to have nothing more to do with the JFM scheme. At a time when the government is trying desperately to increase the forest cover, it is essential that such problems be sorted out, if JFM is to succeed.

VILLAGE USERS VERSUS OTHER USES

Periodically, there are other threats to the forest from development projects – from government orders positing alternative uses or users of the land. Way back in 1940, the village was approached by the collector and DFO requesting timber from Dalki, which they said was needed for the war. But the village refused and since the gaontia was a strong person, there was no forced felling. In 1991, one of the Birla companies wanted to take over some of the protected forest for reforestation, which they identified with the help of one of the committee members. He

Thiruvananthapuram 695 011

Dear Alumni,

You are invited to the get-together of the CDS Alumni on Friday, 29th of November 1996 at 3 p.m. at the CDS Conference Hall.

The meeting is proposed to form an alumni association, under a suggestion made by the Academic Committee and the Director of the CDS. Your presence and co-operation will be very welcome.

Looking forward to meeting you on 29th.

Tilak Baker

Publication Officer

Tel. 0471-448881 84, Fax. 0471-447137, E-Mail. sscds@ren.nic.in

has since been extorted for his role in the affair. According to the current president of the FPC, who narrated the story to us, this happened at a time when the government had asked industries to take up land for afforestation. A meeting was held in the village at which the company asked to be given 32 acres of the protected forest on lease. On further enquiry, the villagers discovered that the area the company wanted for the lease already had a good forest. In fact there was no barren patch as large as 32 acres, and any bare patches there were, were scattered and small. The president says he objected to the meeting as there were no committee members present, and finally the visitors went back empty-handed. Later, the company approached the tahsildar for help. The tahsildar issued a notice stating that the relevant land was being taken up for plantation and that if anybody had any objection they could come to the tehsil and put forward their plea. A copy of this notice was then pasted at the back of the 'panchayat ghar', which was not a very prominent place. Quite by chance, the notice was read by someone just before the last day for appeal, and an objection lodged immediately. The tahsildar gave them a date for appearing, asking the 'villagers' to appear before him to present their objections. As number of persons was not specified, the Lapanga villagers hired five trucks to take them to Rengali. The tahsildar got to hear of this and asked the president to come with a few people. Eventually, two truck loads of people went and won their case against the Birlas.

More recently, the government has given the go-ahead to two thermal power projects in the area. Barely a hundred yards away from the edge of the Lapanga forest is a signboard by Samlai Power Company proclaiming it as a site for a 500 mw thermal power plant (2 x 250 mw). Jharsuguda is rich in coal deposits – villagers building a well or constructing a building have only to dig three to five feet before they come up against the black shoal. Capitalising on this fact, the coal and power ministries have identified sites for thermal power stations, some of which are to be linked to captive coal mines. Under the Ib valley project, Talabira I and II have been given as captive mines to Indalco and Samlai Power Company respectively, to feed their thermal power plants. This is merely part of a larger network of thermal power plants and open cast coal fields in the area, including the Bommaloi TPC, six km away from Lapanga. However, Samlai is apparently not showing signs of progress, and according to ministry sources, there is the possibility that the government might grant the lease to someone else.

The villagers are divided over the potential outcome. While some of them feel that the plant is not about to be implemented

imminently, owing to the fact that the company is engaged in plantation on that land, others are pessimistic about the outcome. Lingraj Dash, one of the older members of the committee, feels that in themselves the power plants may or may not displace the forests, but he expects that the onslaught of people that accompany any such project will cause massive deforestation. The labour which comes to work in the plants will need fuelwood for cooking, thatch for their houses, etc. What was once a green-gold forest will be black and tarred. The elders also fear that as their ranks thin, and the younger members take power, the forest will be lost. As a large number of youths of the village are unemployed, they fear that they will be easily motivated to sell for immediate benefit. The younger men are generally in favour of the power plants, thinking it will bring them employment, as against their elders who expect most jobs to go to skilled outsiders. Women are not seen to figure in either equation. They have no presence in the forest protection committee and are unlikely to get jobs in the power plants.

The history of the coal sector as far as displacement goes has not been very encouraging. Although Coal India (CIL) has recently come up with a 'Coal India Rehabilitation Policy' in the process of getting a 500 million dollars loan from the World Bank and another 50 million dollars from the IDA for coal sector rehabilitation, NGOs and others are not very happy with its assumptions and proposals. As Ratnakar Bhengra (1996), has pointed out, among the conditionalities accompanying the loan is retrenchment of surplus labour, which will reduce even that minimal promise of employment with which CIL could hope to placate potential oustees. While environmental impact assessments may be carried out for a single project, the overall effect of mining, power stations, dams, ancillary industries and other projects in contiguous area means that displacement is compounded several times over [Bhengra 1996:648]. Thus far, less than 35 per cent of people displaced by the coal sector have been rehabilitated, according to 1985 government figures [Bhengra 1996:649]. Further, if recent newspaper reports are to be believed, rather than tightening its environmental damage control laws, the coal ministry is proposing to do away with existing requirements under which an amount of land equivalent to that lost by mining has to be given to the ministry of environment and afforestation costs paid before mining can begin [Mouli 1996].

While coal may be a national good, so are forests. The figure of a requisite 33 per cent forest cover is commonly touted as a national requirement. While government policies such as coal sector rehabilitation and forest sector rehabilitation in the form of joint forest manage-

ment contend for space, inevitably the primary impact is on the livelihood and living spaces of local villagers. Whatever the choices and trade-offs that may be made, the least that should be done is that all classes and castes among local people should be consulted.

In examining the experience of forest management in one village in Orissa over approximately a century, this paper highlights three issues. First, it unpacks the notion of community to show that what may be successful 'community' forest management from the viewpoint of sustainability and efficiency can be far from democratic or equitable. The all-male, predominantly upper-caste constitution of the committee makes it unrepresentative of the needs of the village as a whole. To counterpose community forest management or people's institutions to state institutions cannot be the simple answer to the problems JFM is seeking to address. Secondly, we have argued that what appears to be an entirely 'community' initiative in fact owes a great deal to the way in which 'the state' was organised in areas like Sambalpur. Both the initiating person, the gaontia, and the rules themselves reflect policies in force in parts of the Central Provinces, particularly the feudatory states or zamindari areas. Thus, 'jointness' has been a feature of forest policies for somewhat longer than is usually thought, though not in ways that are commonly understood. Thirdly, effective JFM in the current context requires a complete overhauling of forest and tree-related rules, so as to allow communities the autonomy to take responsible decisions for themselves. There is a fine line to be trod between encouraging local autonomy and responsibility and ensuring that this is democratic – and it is not clear as to who can really do this, certainly not the forest department as it currently stands.

[We are grateful to Roger Jeffery for his inputs and editing, and to our other colleagues in the Edinburgh University Joint Forest Management Research project, funded by the ESRC, and titled 'Organising Sustainability: NGOs and Joint Forest Management in India'. The research for this project is being carried out in Orissa, Andhra Pradesh, Madhya Pradesh and Gujarat, in collaboration with the ICFRE, Dehradun.]

Self-Sufficiency and Allocative Efficiency in Edible Oils

Ashok Gulati
Anil Sharma
Deepali S Kohli

WE welcome the comments by M L Dantwala (*EPW*, July 6) on our paper 'Self Sufficiency and Allocative Efficiency: Case of Edible Oils' (*EPW*, March 30). Dantwala's major remarks on our paper are the following:

- (i) We have overlooked the commendable increase in productivity of oilseeds cultivation;
- (ii) We have ignored a noteworthy feature of the oilseeds economy – that incremental production has been contributed mostly by the areas with relatively low irrigation facilities, through the extension of cultivation to fallow lands, substitution of some low-yielding coarse cereals by oilseeds and their cultivation as a catch crop in some areas;
- (iii) While supporting our argument on excessive price incentives offered to oilseeds producers we used the wholesale price index of edible oils rather than oilseeds and government did not contribute to this relative shift towards oilseed prices;
- (iv) We have argued against the setting up of Technology Mission on Oilseeds (TMO), the National Oilseeds Development Project (NODP), Oilseeds Production Thrust Project (OPTP) and deliberately chosen market intervention in the oilseeds sector for discussion, and
- (v) World prices are not a relevant reference point for judging the appropriateness of domestic prices or allocative efficiency.

Before we respond to Dantwala's criticism of our paper, let us note the main points of agreement. In his concluding section, Dantwala remarks, "for growth in agriculture, our main instrument has to be constant upgradation of cost-reducing technology and its widespread adoption aided by effective extension and support system". This is strikingly similar to what we have concluded in our paper, "policy-makers should shift their focus from overplaying with price instrument to its productivity augmentation, therefore, a strategy which improves the yields and lowers costs will make India a competitive producer of oilseeds on a sustainable basis". Thus it appears that as far as the final conclusion is concerned we are on a similar wavelength. However, there is a major difference in the approach that has led Dantwala to come to this conclusion and how we came to the same conclusion. It may be worth recalling that the focus of our paper, and that is what differentiates it from earlier works, is to know what would happen to cropping patterns in Indian agriculture under an open economy environment. It is well known how Indian agriculture had been largely insulated from global markets through export/import controls. The case of the

'oilseeds revolution' is a story of 'success' under a highly protected environment and as trade is opened up 'self-sufficiency' in edible oils would come under greater threat. It is this argument which lies at the heart of our paper. But Dantwala rejects it outright by saying, "I do not accept the border prices as relevant reference point for judging the appropriateness of domestic prices or for their determination". He may have some valid reasons for this, on which we may respectfully differ with him. To us, in an open economy, world prices do reflect 'make-buy' options, they do represent the opportunity cost of producing commodities in the name of self-sufficiency at home and hence they do determine whether the country is an efficient producer of a particular commodity in question or not. In other words, a comparison of domestic prices with border prices does provide an indication of allocative efficiency in cropping patterns, when the analysis is carried out in an open economy framework. We also believe that world prices would increasingly influence our policy choices in the years to come, as the economy opens up. The proof of this lies in looking at how business decisions are changing in this sector.

With the reduction in import duties from 65 per cent to 30 per cent in March 1995, imports of edible oils went up to 985 thousand tonnes (financial year 1995-96), which accounts for about 15 per cent of our consumption. Now import duty has been reduced to 20 per cent in this year's budget (1996-97) and imports are likely to touch 1.5 million tonnes despite record harvests of oilseeds. Major private sector companies, which were important players in, say, sunflower oil production are becoming large importers of sunflower oil. This trend is being witnessed when coconut oil is still at 65 per cent import duty and the rupee has depreciated by 131 per cent between 1988-89 and 1995-96. If this had not happened and import duties had been reduced, India would be importing about 30 per cent of her requirement, a situation similar to the one that existed in the mid-1980s. The current trends in liberalising trade policy for agricultural commodities indicate that India will import about one-fifth to one-fourth of her consumption of edible oils with a liberal import policy.

Dantwala states that a percentage change in yield per hectare of oilseeds between TE 1986-87 and TE 1993-94 was distinctly higher than that of rice and wheat and we preferred not to comment on this increase in the productivity of oilseeds cultivation. We

can commend that now if it is this increase in productivity that has raised production, achieved 'self-sufficiency' in edible oils, and is sustainable even under an open economy framework. But unfortunately our analysis reveals that it is primarily area expansion that has led to 'self-sufficiency' and productivity augmentation had only a secondary role. We do recognise that improvement in productivity would also lead to increase in area. If the entire shift is due to improvement in productivity, and not due to protection, we are happy and would like to support Dantwala. In that case, bringing down import duties on edible oils to say 5 per cent, equivalent to those on pulses, should not invite any opposition and self-sufficiency in edible oils should remain on firm ground. But what is unfolding does not lend support to this. Increasing imports with reduction in import duties are undermining the 'self-sufficiency' in edible oils and it won't be a surprise that very soon it invites opposition from vested interests who have flourished under a protected environment.

While quoting CACP price policy report Dantwala comments that a noteworthy feature of oilseeds economy is that incremental production has been contributed mostly by the states with relatively low irrigation facilities – Madhya Pradesh, Rajasthan and Karnataka. The additional area under oilseeds came mainly through the extension of cultivation to fallow lands, substitution of some low-yielding coarse cereals by oilseeds and their cultivation as a catch crop in some areas. However, this is only partially true, because changes in irrigated area during the 1980s tell a different story. If one looks at the changes in area between 1985-86 and 1992-93, one finds that about 6.3 million hectares of additional area was brought under oilseeds cultivation, about 48 per cent of which was irrigated (3 million hectares). Therefore, extension of oilseeds cultivation to irrigated areas would certainly have had an effect on oilseeds production, because the yields in irrigated areas, in any case, are 1.8 times those in unirrigated areas. It may be that these irrigated tracts are still those areas where irrigation remains under some stress, but surely these are not 'dry lands', and, therefore, the incremental production cannot be solely or even largely attributed to dry and fallow lands.

Dantwala also contends that in support of our argument on excessive price incentives offered to oilseeds producers we use the wholesale price index of edible oils rather than oilseeds. The reason for this is simple. The prices of oilseeds are jointly determined by the domestic edible oil prices which are influenced by the degree of protection accorded to edible oils and export price of oilseed meals. Even if one considers the wholesale price indices of oilseeds, our analysis still holds. Dantwala states that government did not contribute to this relative shift towards oilseed prices as the relative prices of oilseeds were unfavourable

compared to rice and wheat (from 1982-83 to 1985-86). If this is true then the post 1985-86 increase in the wholesale prices of oilseeds clearly establishes the effect of government intervention in this sector. A comparison of the average annual changes in the wholesale price indices of foodgrains and oilseeds during the period 1985-86 to 1991-92 reveals that oilseeds witnessed an increase of 14.81 per cent per annum, whereas for foodgrains the increase works out to 9.83 per cent per annum. Further, Dantwala says that the device of Minimum Support Prices (MSP) was not used to favour oilseeds as a group. However, the device of MSP was, in fact, used when the government announced its integrated policy for oilseeds fixing the wholesale price band for oil at Rs 20-25 per kg in 1988-89. The National Dairy Development Board (NDDB) was entrusted with the task of maintaining the above price band by means of buffer-stocking operations. The 'price band' policy sought to fix the procurement prices of groundnut and rapeseed-mustard "at least 40 per cent above the present levels recommended by the Prices Commission". The result of such a policy was that the wholesale prices index of oilseeds increased by 55.1 per cent between 1988-89 and 1991-92 and the increase for edible oils during the same period works out to 56.5 per cent. This surely had repercussions on other competing crops thus raising questions regarding the 'efficiency' implications of such policy measures. The correction started from 1992-93 onwards, when India had to import wheat at an import price which was more

than double of what was being paid to Indian cultivators of wheat. The procurement prices of wheat and rice were subsequently raised to somewhere near their export parity levels.

Another point that Dantwala makes is in connection with our response to TMO and other production programmes. He says, "GSK speak disparagingly about the government's effort to step up production of oilseeds. They virtually blame the appointment of Technology Mission on Oilseeds (TMO), the National Oilseeds Development Project (NODP), Oilseeds Production Thrust Project (OPTP)." On the contrary, we do recognise that it is not unusual for the government to set up technology missions whenever it finds that a particular crop sector is performing badly. We do welcome that. But our main argument in this respect has been that it should focus more on productivity augmentation and not prices. Unfortunately, it appears that TMO became more a 'prices mission' and less a 'technology mission'. It ought to have concentrated more on the development/diffusion of technology that increases yields, cuts costs and makes larger supplies available at lower prices. But in our opinion, based on empirical analysis, that did not happen. TMO did raise production, primarily by expanding area under oilseeds, and that too under very high protection from world markets. We feel economically it is not an efficient approach to expand production of edible oils at double the world prices, especially when such a policy affects the production of other crops in which the country has a comparative advantage.

to an impressive level of 19 per cent from 8.36 per cent in 1950-51.

It would be interesting to examine the composition of value of output from the livestock sector which is presented in Table 2. The data show that there was less of diversification in the livestock sector as reflected by the increasing share of milk group and declining share of meat group and others. That is, there is a concentration in milk group related activities towards 1990s. The share of output from milk group related activities increased from 58.30 per cent in the year 1950-51 to 68.16 per cent in 1990-91. Production of eggs also registered an increase in share from 1.59 per cent to 4.16 per cent between 1950-51 and 1990-91. There has been reduction in the share of other activities which include dung, wool, hair, etc, during the above period.

Several other developments have been taking place in Indian agriculture in recent times. During the last decade, corporatisation of agricultural sector was witnessed in the form of establishing teak farms, orchards, plantations, floriculture, etc. In these enterprises the costs of land, maintenance, etc, are met through public subscription of shares with promises of attractive returns on the investments to the investors. A wide variety of schemes, including schemes of fixed deposits, are being floated. Most of these companies are engaged in developing wastelands. Although most of such ventures are concentrated in teak and other plantations and orchards, new areas are also explored. For instance, goat rearing has been offered for public participation recently by some of the promoters. While the success of such ventures is yet to be established, these schemes are important attempts to combine professionalism of a few with pooled resources from public, thus involving a cross-section of population in agriculture indirectly. The proliferation of such ventures will depend on the willingness of the state governments to amend the land ceiling acts. Two state governments - Madhya Pradesh and Maharashtra - have already taken the initiative to make farm land available for joint ventures. Madhya Pradesh decided in June 1995 to grant case-by-case exemption from land ceiling laws for corporate farming and agro-development projects. Maharashtra allowed the State Farming Corporation (SFC) to take up joint cultivation with private partners. SFC provides land whereas the private partners contribute financial and technical inputs.

Further, there has been a spurt in hi-tech projects in agriculture and allied sectors including horticulture and aquaculture in the 1990s. India ranks first in the world in vegetable and fruit production. The estimated annual production of horticultural products is 100 million tonnes. The export of processed fruits and vegetables has been increasing steadily during the recent years. The value of exports of fruits and vegetable products such as dried and processed vegetables, mango pulp, pickles and other processed products was Rs 206 crore in 1990-91 and has more than doubled within four years, i.e., by 1994-95.

Commercialisation and Diversification of Indian Agriculture

K J S Satyasai
K U Viswanathan

INDIAN agriculture has experienced spectacular changes in the recent period manifesting large-scale commercialisation and diversification. They broadly include cultivation of new crops and varieties, increase in the share of area under cash crops, large-scale spread of livestock activities and fisheries, pursuance of hi-tech agriculture in the areas of aquaculture, bio-technology, horticulture, processing, etc. The latest changes are basically responses of our agriculture to the new economic environment ushered by the process of liberalisation. In this context, M V Nadkarni's contribution is valuable as it examines the commercialisation in its different dimensions [Nadkarni 1996]. The following discussion is meant to supplement his findings on three counts. Firstly, diversification has taken place towards allied agricultural activities such as animal husbandry, fisheries, hi-tech projects, etc, which Nadkarni has explicitly mentioned but does not cover as he has restricted the scope of his paper to the crop sector only. We, however, wish to highlight some of the interesting trends observed in these allied sectors followed by a brief account of recent

developments towards commercialisation. Secondly, we attempt to develop a composite index of commercialisation combining different indicators of commercialisation at the macro-level as well as the state-level. Lastly, we wish to briefly examine commercialisation *vis-a-vis* food security which is an issue of current interest and which Nadkarni did not address.

The sectorwise composition of income generated from agriculture is presented in Table 1. In 1950-51, crop and livestock sectors together contributed 87.86 per cent of the income from agriculture, followed by forestry and logging (10.91 per cent) and fishing (1.23 per cent). By 1990-91 the composition had changed significantly, such that the share of the crop sector and livestock sector together increased to 92.90 per cent of the income. The share of forestry and logging drastically declined to 4.73 per cent. Fishing has gained prominence by nearly doubling its share to 2.37 per cent from 1.23 per cent in 1950-51. A noteworthy trend is that the share of the crop sector declined from 79.50 per cent in 1950-51 to 73.90 per cent in 1990-91 as the share of livestock increased

to Rs 469 crore. India has vast potential for development of aquaculture, both in inland and marine fisheries. Fish production which stood at 1.7 million tonnes in 1970-71 reached 5 million tonnes by 1993-94. India's export earning from fish production was of the order of Rs 2,000 crore in 1993-94 of which 74 per cent was from export of shrimps. Other emerging commercial ventures are in floriculture mainly confined to cut flowers such as rose, carnation, orchid and wax flowers. Production of hybrid seeds of high value ornamental, indoor foliage plants as well as vegetables are other potential areas. Mushroom production is also gaining importance and about 26 thousand tonnes of buttons were produced in 1994-95. However, disparity across different regions has been observed in the spread of hi-tech projects [for a detailed account, see Puhazhendi 1995].

The various quantifiable indicators that can describe the phenomenon of commercialisation can be classified under two groups—one on the output front and the other on input front. The output front includes proportion of area under cash/commercial crops, share of marketed surplus and so on and the input front indicators are proportion of purchased inputs, intensity of technological inputs, etc. About 16 of such indicators are combined into an index with 1970-71 as base which is given below.

Year	Composite Index
1960-61	31.41
1970-71	100.00
1980-81	164.91
1990-91	261.36

There has been an impressive growth in commercialisation as indicated by the composite index which rose from 31.41 points in 1960-61 to 164.91 points in 1980-81 and further to 262.03 in 1990-91.

The regional/state level pattern suggests (Table 3) that in 1970-71 while Punjab, Tamil Nadu, Haryana, Gujarat, Andhra Pradesh and Uttar Pradesh stood in the first

six positions in descending order, states of the eastern region, Madhya Pradesh in north, Maharashtra in the west and Karnataka in the south compared poorly with the all-India average. Although the top ranked states in terms of commercialisation retained their status in 1990-91, the index has come down in almost all states indicating that the inter-state disparity in commercialisation has narrowed down. The states that performed better in improving their position in respect of commercialisation were West Bengal and Orissa in eastern region and Maharashtra in west and the losers were Bihar and Rajasthan.

The growing importance of non-food grain crops [Nadkarni 1996 and Sawant and Achuthan 1995] in terms of increase in their share in area over time would have seriously thwarted our food security system had it not been for the introduction of green revolution technology in 1967-68 which brought forth impressive improvements in crop yields. As a result, food grain output increased and with it market arrivals. Crops such as rice and

wheat have attained a commercial status and have been substituted for other uneconomical crops on a large scale. This had a positive influence on our food security despite a growing population. We could stock adequate buffer of foodgrains too.

Important changes in the agricultural sector that positively influenced our food security were increasing share of livestock and fishery products on the one hand and increase in the share of fruits and vegetables in the total food supply basket. These developments improved the availability of animal protein as well as fruits and vegetables in the Indian diet.

Increase in household income and change in consumption pattern in terms of nutritive values are natural consequences of commercialisation. Based on preliminary data from a study conducted in developing countries, Bouis (1995) concludes that commercialisation has increased income levels in almost all the developing countries which in turn has led to higher calorie intake. There is little evidence that commercialisation *per se* has altered consumption behaviour in a manner that is detrimental to proper nutrition. Greater dependence on the market for food has not led to higher cost per calorie intake. India's experience seems to be different since the increase in level of food security came in the wake of commercialisation mainly via increased food supply. Improving food security level in the Indian way seems to be better since it will not lead to dependence on imports.

Before concluding, we share the concern of M V Nadkarni over the entry of educated people (we may call them 'urban farmers') in agriculture. In this context it may be mentioned that hi-tech agricultural projects demand technical and managerial expertise besides being highly capital-intensive and hence the average farmer is debarred from actively participating in the commercialisation process of the current decade. Only co-operative ventures would allow their participation.

YOUR FOUR-WAY OPTION WITH IDBI'S FIXED DEPOSIT SCHEME*

TYPE	MINIMUM DEPOSIT	YIELD STRUCTURE
Monthly Income Option	Rs. 18,000	Rs. 210 every month on a 5 year deposit of Rs. 18,000
Quarterly Income Option	Rs. 10,000	Rs. 350 every quarter on a 5 year deposit of Rs. 10,000
Lumpsum Discounted Interest	Rs. 10,000	You will get Rs. 4,806 immediately on a 5 year deposit of Rs. 10,000
Cumulative Option	Rs. 10,000	A Rs. 10,000 deposit becomes Rs. 19,898 in 5 years

*Interest up to Rs. 13,000 on the above deposits is tax-exempt under Section 80L of the Income Tax Act, 1981

MINIMUM DEPOSIT : RS. 10,000

Beyond the minimum amount, you can deposit in multiples of Rs.1,000. The base interest rate for a three year deposit is 13.5%. And a deposit period of

five years
and more fetches
a base rate of 14%.

What's more, this deposit comes with the guarantee of India's premier development bank - IDBI. Reflected in the CARE AAA (FD) rating by CARE and the FAAA rating by CRISIL given to this product indicating the highest degree of safety. Naturally, an organisation that has total assets of over Rs. 40,000 crores can take very good care of your investment. For more details contact your nearest IDBI office or any authorised IDBI agent.

This opportunity is open to : * Resident Individuals
* Hindu Undivided Families * Partnership Firms
* Companies/Bodies Corporate/Societies
* Trusts /Association of Persons.

Vol XXXI No 47

November 23, 1996

Unstable Economy and Ineffective Policies

A comparison of the trends and the amplitude of fluctuations in several key macro-economic variables in the pre- and post-1991 periods suggests increasing economic instability which encourages speculative activity, especially with financial sector liberalisation and the opening up of the economy. At the same time, the nature of state intervention under the new economic policies has reduced policy effectiveness in controlling and coping with the increased economic fluctuations. **3061**

Gender and Development

The ideologies of globalisation and structural adjustment seek to make one deaf to the immediate past and to anything that does not speak in the language of efficiency. However, the contemporary changes overtaking us, disturbing as they are, also harbour the possibility of bringing our political and intellectual engagements on to, new and fruitful terrain. For those who have been working at the interface of gender and development, it is time to refigure their priorities, not by secluding themselves within some putative 'pure' economy, but by broadening feminist conceptions of the economy itself. **3071**

Bioresources Policy

Now that bioresources are becoming a highly sought after raw material in the era of biotechnology, we must create a framework for the just and proper use of and appropriate payment for indigenous technology. This calls for a comprehensive national policy. **3043**

Growing Distances

The 'globalisation' of the world is inevitable; new technology has already brought it about. But we must all bend our minds to determining how the benefits of new technology can be reached to the entire humankind, instead of increasing the distances between nations and peoples. **3039**

US and South Asia

The United States' South Asia policy of favouring Pakistan embodied the flaws and misconceptions inherent in the doctrine of containment. But succumbing, even in the post-cold war period, to the various parochial interests that profit from a perpetuation of the cold war subculture weakens peace, prosperity and political stability in South Asia. **3078**

Research for Policy

T N Krishnan, who died in Thiruvananthapuram on September 7, was of the firm view that his research, which encompassed food policy, literacy, health, fertility behaviour and social security, should not just end up in the annals of academia but must be used to change and improve policy. **3047**

For Capital Only

While the OECD countries have proposed the Multilateral Agreement on Investment, the opportunities open to the poor countries for exporting labour services have been crippled by the GATT-Uruguay Round. The developing countries as a group must focus on this asymmetry at next month's WTO Ministerial Conference and in subsequent rounds of WTO negotiations. **3045**

Ethnicity and Pakistani State

The continuing ethnic tensions in Pakistan are rooted in a number of developments: the growing ethnic heterogeneity of the country's provinces, the increasing economic and political interdependence, the ongoing processes of rapid urbanisation and cultural homogenisation and the sharpening ethnic asymmetries within the elite. These very developments, however, offer the opportunity for seeking solutions within a multi-ethnic framework. **3050**

Chiapas Uprising

What made the Chiapas uprising appear novel was its timing - it occurred during a period of worldwide leftist retreat and in particular at a moment when other central American guerrilla movements were laying down their arms and entering into political deals with the neo-liberals in power. **3054**

Symposium on Sardar Sarovar

THE controversy over the Narmada dams is nowhere close to being resolved, but we may soon find that the river has been injured beyond our capacity to heal it. Life on its banks is already under deep stress, and an injured Narmada cannot protect it from further decay. The Bargi dam has now shown its power of unmaking for five years, and the Sardar Sarovar dam – incomplete though it is – has given more than a glimpse of what words like 'submergence' and 'displacement' mean.

Some of us who have been to the environs of the Sardar Sarovar dam feel that a personal experience of its geography has no substitute. What the river and the hills (Vindhya and Satpura), through which it flows, mean to the people who live beside it cannot be appreciated without going to Mandla, Jalsindhi or the other villages staring at death in the shadow of the dam. This feeling has prompted us to make an appeal to our colleagues in literature, the arts, the academia and the media to visit the Narmada valley at Sardar Sarovar this winter. We believe that this community will respond to our appeal in view of the status of the Narmada as a river in India's geography and its value as a symbol of the struggle to establish democratic dialogue and rights.

This appeal will be formally made at a symposium to be held on November 24 at Teen Murti Auditorium, New Delhi. It will focus on two texts which summarise the problem with Sardar Sarovar in simple, human terms. The first is the text of a letter dictated by Bawa Mahana of Jalsindhi village inhabited by people of the Bhilala tribe. Originally in Bhilali, this letter was addressed to the chief minister of Madhya Pradesh in 1994. The other text is a letter written by Bradford Morse and Thomas R Berger to the president of the World Bank in 1992 as a foreword to the Independent Review of the Sardar Sarovar Project. It may be recalled that the late Morse was the chairman of this review committee and Berger was the deputy chairman. This review committee was appointed by the World Bank as a consequence of the pressure generated worldwide by environment groups and by the ongoing struggle in the Narmada valley, for an independent re-examination of the Narmada projects. The World Bank had to finally withdraw its support to the Sardar Sarovar Project in 1993.

The symposium is likely to be a full day event. Members of the audience will be

requested to participate in the dialogue. A documentary film by Anand Patwardhan and Seemantini Dhuri, *Narmada Diary*, will be shown prior to the dialogue.

This symposium is not about the customary debate on big dams or models of development. Therefore it requires us to beware of our usual reflexes which get expressed in expected ways in questions such as 'what is the alternative?', 'what other sources do we have for electricity, water, etc?'

Hindus and Muslims

RAMASWAMY R IYER's 'Hindus and Muslims: Towards a New *Modus Vivendi*' (EPW, July 27) not only breaks new original ground, it is transparent and proposes an agenda of real issues for action. The analysis of the distorted usage of terms like 'secularism', 'communalism', 'Hindutva' clears the air and may create the conducive environment for fruitful dialogues. One must caution against trying to create a unified religio-cultural ethos or fusion, which must come from within and cannot be externally imposed. There has been too much talk in recent years of a separate Muslim identity which supersedes nationalism, so that in the words of the erudite Syed Shahabuddin, we have 'Muslim Indians' and not 'Indian Muslims'. To balance this we have exaggerated notions of the inherent tolerance in the very nature of Hindu religion and philosophy, providing space for other faiths to thrive. The author takes into consideration all these aspects in proposing the agenda.

The moot question now is the *modus operandi*. The so-called secular parties, e.g., Congress and most of the UF constituents rule themselves out for such dialogues because of either their vote-bank politics or promotion of caste interests. Union minister C M Ibrahim reportedly recently led a delegation of Mumbai Muslim leaders for a dialogue with Bal Thackeray and the Shiv Sena. Rumours have it that Mumbai Muslims are happier with the Shiv Sena-BJP administration than they were with the preceding Congress administration. This is of course a chance coincidence with the appearance of Iyer's article. There is need for discussion on the appropriate *modus operandi* at village, community, city, state and national levels. A related question is whether only a ruling group dominated by the Hindus can effectively negotiate and

solve problems with Pakistan and Bangladesh – proclaimed Muslim states?

Tirade against Hussain

WE strongly protest against Sangh parivar's tirade against Hussain's paintings 'Saraswati' and 'Draupadi' on the grounds that Hindu goddesses have been shown in obscene postures. Also they are giving it a communal colour by projecting that Hussain, a Muslim, is hurting Hindu sentiments. They are calling him a 'traitor'. They have also gone on a rampage and destroyed his paintings in Ahmedabad.

The treatment being meted out to Hussain is quite akin to the fascist-Nazi attitude towards artists. This is an attack on the freedom of expression of an artist. Hussain has been painting similar motifs since long, but it is now that these fundamentalists are making an issue of this painting by Hussain. This is in line with the fascist-fundamentalist attacks on secular and liberal ethos of our society, which was manifested earlier by their call to ban Rushdie's *Moore's Last Sigh*, their pre-censoring of the film 'Bombay', and their blackening of the face of one of the actors of the play 'Ram Bharose' in Pune.

We condemn this attempt to tarnish the image of a creative artist for narrow communal goals. We also condemn the attack on freedom of expression of artists and protest against this onslaught on liberal culture of our society. We suspect that their dastardly acts are being engineered to distract the attention of society from the mess created by the Ramesh Kuntase and Sarpotdar's revelations before the Srikrishna Commission inquiry. We also condemn the police attitude in registering a case against Hussain even as their complicity in the Mumbai riots is being exposed in Srikrishna Commission's proceedings.

Correction

In the article 'Contextual Social Science: Or Crossing Boundaries' by Amiya Kumar Bagchi (October 26) the last sentence of column three on page 2880 should read "In China, Hong Kong, Taiwan and South Korea, for example, rapid fertility transition has been accompanied by an increasing ratio of males to females at birth" instead of "... an increasing ratio of females to males at birth". The error is regretted.

Ed.

Corporate Myths and Fairy Tales

CORPORATE India has assiduously propagated a number of myths. One is that much of its surpluses are drained by corrupt politicians and bureaucrats who control the regulatory apparatus. A second is that this combination of regulation and graft has often necessitated 'inefficient' decisions on its part. And third that, despite these constraints, big business has managed to eke out a profit based on sheer professional competence and good corporate governance.

The evidence yielded by investigations of alleged tax and foreign exchange law violations by ITC – one of the country's much-acclaimed blue chip companies – seems to subvert all these well cultivated myths. The findings emerging from investigations still under way read like a conspiracy off the pages of a corporate thriller. Senior ITC managers, exploiting the manoeuvrability that the 'imported' ITC brand, exclusive lifestyles and a self-created image of efficiency provided, chose to accumulate large foreign exchange holdings abroad. This process of accumulation was by means of alleged illegitimate practices such as over-invoicing of imports or insider trading in ITC's own GDRs. The illegally accumulated foreign exchange was then used to meet various foreign exchange 'expenditures', including personal expenses of senior executives, losses in international operations which the ITC management was unwilling to declare for fear of being judged harshly, and payments for over-invoiced exports from Indian branches of the ITC group which could thereby record non-taxable profits. The funds were paid out to and disbursed for these purposes by companies belonging to an NRI group (the Chitalias) which was virtually set up by the ITC management. According to the evidence reported thus far, the illegitimately accumulated funds were transferred to the Chitalias so that they could make a range of payments at ITC's behest. These payments included an inexplicable 'compensation' to NRI investors in the ITC-promoted Bukhara chain of restaurants, in lieu of losses incurred by the latter on a voluntary investment risk they took. They also involved payments back to ITC companies in India, which over-invoiced their exports to the Chitalia companies. These exports were sold by the Chitalias to third parties at a lower, pre-negotiated price and the difference made up by transfers from the ITC pool of 'surplus'.

This complex operation involving a number of ITC, Chitalia and third-party companies proved difficult for the elite ITC management to pull off. The evidence allegedly suggests that large losses were incurred on both investments made, as in the case of the Bukhara chain, as well as in trade deals. With the losses exceeding the sums being accumulated abroad, ITC could not transfer adequate funds to the Chitalias to meet the

costs of the services they were rendering. In response, the ITC management allegedly behaved like a group of 'rogue traders', speculatively ordering the transfer of payments received by the Chitalias on the sale of new exports to meet losses on past exports, in the hope that the difference could be made up in the future. This it was hoped would help keep the lid on the mismanaged operation. Unfortunately, ITC was soon under considerable pressure from the RBI to remit what were fake export earnings from abroad and from the Chitalias wanting to be compensated for the services they were rendering. In a panic move ITC entered into a legal battle with the Chitalias, which soured their cozy relationship and found the latter turning approvers in an Indian government investigation into alleged FERA violations which finally opened up the can of worms.

But this is not all. It now transpires that transnational BAT Plc, which holds a 31.5 per cent equity in the company, was not just aware of but was perhaps even involved in many of these transactions. This could explain why it did not call the bluff when former chairman K L Chugh sought to retain management control by launching a 'nationalist offensive' against BAT's attempt to increase its equity holding to 51 per cent. Further, even the nominated directors of the financial institutions, holding another 36 per cent of the equity, were aware of the goings on, at least after an audit committee report by accountants Lovelock & Lewes had exposed the allegedly criminal international dealings. These extensions of the state chose to ignore for some time dealings that deprived the government of large sums of revenues.

There are a number of revealing aspects to this evidence. First, if ill-gotten fortunes were being sought to be amassed in these operations, it was because the managers of a successful high-profile company were resorting to a process of 'primitive accumulation' at the expense of the state and not because politicians were providing the company the cream they wanted to skim. The mechanism involved transferring profits abroad by over-invoicing equipment imports. The foreign exchange thus accumulated abroad was brought back into the country by over-invoicing exports and shoring up the company's tax-free export revenues. In the process higher post-tax profits were booked at the expense of the government. Second, government regulation could not have motivated these transactions, nor did it serve to prevent them. Almost all the reported deals took place during the years of reform, when tax rates were lowered and the trade and foreign exchange regimes were substantially liberalised. Even to the extent that the government was present as shareholder, its representatives did not exercise their rights or fulfil their duties. If anything, the absence rather than the

presence of real intervention could explain the episode. Finally, to the extent that the ITC management chose to do what it did, it needs to be noted that it made a hash of the whole operation, revealing its incompetence in any area outside that of exploiting its inherited brand image. These lessons from the ITC episode make nonsense of the corporate myths mentioned at the beginning.

In fact, a plausible argument yielded by the evidence is that even some of the 'best' in corporate India make their profits by garnering illegitimate transfers from the state and by buying out and exploiting the regulatory apparatus of the state. It is the same behaviour that prevails both before and after the reform, though the sites of accumulation within a terrain provided by the state shift with liberalisation. This implies that there was and is no force which 'disciplines' Indian capital, forcing it to run a professional operation, innovate and engage international markets. Reform instead of attempting to enforce that discipline uses the market as a cloak for permitting more of the same.

SHARED RIVERS

Unequal Arrangements

ON inter-state disputes over the sharing of water between riparian states, the Sarkaria Commission had recommended that the union government should have the power to appoint a tribunal *suo motu*, if necessary. In addition, the union government should be obliged to appoint a tribunal within one year of an application by a disputant state. In either case, however, the award of the tribunal should, according to the commission, be as binding as an order of the Supreme Court. For this purpose, the commission recommended appropriate amendments to the existing union legislation.

Interestingly, two altogether opposite views were put forth on this subject at the Inter-State Council's meeting on October 15. Andhra Pradesh expressed the view that the Sarkaria Commission's recommendations were "too sweeping" and required "to be moderated". It was particularly concerned to ensure that the recommendations of the commission "should not be taken advantage of by the states to reopen settled issues". More specifically, Andhra Pradesh felt that "it is the lower riparian states who, as a class, stand to suffer the most" and so wanted that "the right to approach the centre for the constitution of a tribunal should be limited only to the lower riparian states".

Exactly the opposite view was voiced by Kerala which, as an upper riparian state contributing some 20 per cent of the surface flow of the Kaveri, asserted that its people had "legitimate claim to a major portion of

their contribution to the water of the Kaveri, be it for irrigation or power". It called for "equitable apportionment of waters of an inter-state river" and rejected the demand for apportionment on the basis of "prior use or present demand for water". That the "lower riparians have been using waters of a river for hundreds of years" does not entitle them to these waters "more than upper riparians", claimed the chief minister of Kerala. According to him, "with the advancement of technology in the field of irrigation, even the uppermost riparian states could use all the water at their disposal". Of course, Kerala found fault with the centre also for its "persistent refusal to grant clearance" to one of its projects entailing use of a small part of the Kaveri waters within its jurisdiction, while "Karnataka presses ahead" with its project downstream.

Rather interestingly, Karnataka's chief minister chose to be somewhat tongue-tied on the subject, except to say that he could not persuade himself to agree with the recommendations of the Sarkaria Commission on the proposed amendments to the existing legislation. He preferred to emphasise "the desirability and feasibility of settling the differences by mutual discussions" between the concerned states and referred in this context to the centre's initiative to appoint a commission "whose recommendations would be a prelude to formulating the guidelines for a National Water Policy". Karnataka is silent on what principles should govern water sharing between upper and lower riparian states. Obviously, it too, like Andhra Pradesh, would prefer not to let old settled arrangements to be reopened. But what about the states which feel strongly that the so-called settled arrangements treated them unfairly and would not rest until these arrangements are reviewed and re-negotiated? Against this background, the new commission may well be an exercise of the type governments resort to all too often in order to put a contentious issue on the back-burner for as long as possible.

THE ECONOMY

Changing Foreign Liabilities

THERE have been significant changes in the composition of capital flows to the developing countries in recent years – from official to private flows and from debt to non-debt flows. Even private debt flows now largely take the form of marketable bonds. Non-debt flows to the developing countries were \$28.3 bn in 1990 or less than 40 per cent of the total debt flows of \$73.2 bn. By 1995 non-debt flows had reached

\$112.3 bn and were 94 per cent of the debt flows of \$119 bn in that year. The stock of FDI in developing countries is estimated to have more than doubled from \$300 bn to \$620 bn between 1990 and 1995.

It is thus not enough any longer to look only at a country's external debt; what is necessary is an assessment of its external liabilities as a whole. The release by the Reserve Bank of the results of its latest Census of India's Foreign Liabilities and Assets as on March 31, 1992 is, therefore, to be welcomed. The census is undertaken by the RBI quinquennially, the last one being for March 31, 1987, though there was a long break between 1961 and 1987 when instead annual assessments were undertaken of foreign liabilities (almost comprehensive) and foreign assets (only for the official sector and not the corporate and banking sectors). The annual assessments continue to be made between the census years. Thus the latest census report also presents data on foreign liabilities and assets based on the annual assessment as of March 31, 1993.

As per the census, India's foreign liabilities were Rs 2,70,799 crore (\$86,723 mn) as on March 31, 1992 compared with Rs 62,116 crore (\$48,197 mn) on March 31, 1987. However, while the former figure includes non-civilian (defence) debt, the latter does not. Inclusive of such debt, the figure for March 1987 may have been of the order of Rs 79,000 crore or \$58,000 mn. There was a further growth in foreign liabilities to Rs 2,90,988 crore (\$93,160 mn) on March 31, 1993 as per the latest annual assessment. Thus between March 1987 and March 1993 total foreign liabilities rose by 61 per cent in dollar terms and 268 per cent in rupees. The dollar itself depreciated by 10 to 12 per cent in terms of the SDR during the six-year period. Considering that the depreciation of the rupee *vis-à-vis* the dollar was about 142 per cent over the six years, whereas the effective exchange rate of the rupee in nominal terms depreciated by only 46 per cent, the different configurations of currencies involved in the country's foreign liabilities may be such that the increase in the country's liabilities would be much more than 61 per cent if the currencies were appropriately weighted to work out the effective increases in the liabilities. Besides, the RBI's data underestimate foreign liabilities in one respect – they take foreign investment in shares and debentures at face value in rupees, whereas the investment should be valued at market prices (though to an extent the inclusion of free reserves and surplus in respect of individual companies makes up for this). All the same, aggregate foreign liabilities have gone up from 27 per cent of GDP in 1986-87 to 41 per cent in 1992-93.

Of the aggregate liabilities of Rs 2,90,988 crore, foreign debt was Rs 2,82,103 crore or 96.9 per cent. Of the balance, Rs 6,403 crore comprised FDI and portfolio investment of the corporate sector, Rs 1,312 crore represented vostro accounts of banks and Rs 1,170 crore were liabilities of insurance companies in the form of LIC's actuarial reserve value payable to non-residents and reinsurance business and outstanding claims of the GIC. Official liabilities constituted Rs 1,70,485 crore or 58.6 per cent of aggregate foreign liabilities of Rs 2,90,988 crore (including non-civilian debt), the balance being accounted for by the corporate sector (Rs 67,257 crore or 23.1 per cent), the banking sector (Rs 52,076 crore or 17.9 per cent) and the insurance sector (Rs 1,170 crore or 0.4 per cent).

Foreign assets held by official and non-official agencies constituted 13-14 per cent of aggregate liabilities. Official non-gold foreign exchange reserves accounted for nearly 70 per cent of total foreign assets, the balance being the corporate sector's deferred export receipts, investment and balances held abroad and miscellaneous assets and the banking sector's nostro accounts and insurance companies' assets. Direct foreign investment by the Indian corporate sector was about Rs 770 crore or 10.3 per cent of the corporate sector's total foreign assets of Rs 7,483 crore at the end of March 1992.

The data from this census do not, of course, capture the major qualitative changes in the country's foreign liabilities as a consequence of the economic reforms which have occurred in the more recent period. On the one hand, with the sharp reduction in short-term debt, including foreign currency deposits of up to one-year maturity, total external debt, which had increased from \$ 83.30 bn (Rs 1,63,001 crore) at the end of March 1991 to \$ 99 bn (Rs 3,11,792 crore) at the end of March 1995, came down to \$ 91.2 bn (Rs 3,13,272 crore) at the end of March 1996 (partly also due to the appreciation of the dollar). Simultaneously, there has been a significant rise in FDI and portfolio investment. Between 1993-94 and 1996-97 (so far), the addition to liabilities on this count has been \$ 17.5 bn or over Rs 60,000 crore. The profile of the country's foreign liabilities is thus undergoing a significant change in favour of non-debt liabilities, leading to growing pressures on the external sector. If only for this reason, it is to be hoped that the RBI would further strengthen its monitoring arrangements, including periodical surveys of foreign collaboration agreements so that we get, on an on-going basis, a reliable assessment of the costs and benefits of foreign technical and financial collaborations. Besides, as between FDI and portfolio flows, the latter has outstripped the former. Of the

inflow of \$ 17.5 bn, only about \$ 6 bn would be FDI, the balance of \$ 11.5 bn being in the form of GDRs, FIIs' portfolio investment and offshore funds, etc. There is little systematic information at present on the distribution of these inflows by industries and by secondary and primary markets, on gross sales and purchases, on capital appreciation and yields realised, on lock-in periods and so on. It would be of great value if the RBI were to put together periodically, with the help of SEBI, a fuller profile of the portfolio investments of FIIs.

DEVELOPMENT AND DISPLACEMENT

Airy-Fairy Policies

In one of the latest World Bank interventions in the Indian economy, two major projects in the coal sector are being finalised, which when implemented will oust some 18,000 villagers from their homes and lead to the retrenchment of a huge number of the current staff of Coal India – apart from having far-reaching implications for India's coal economy.

The two projects are linked with each other, with one aimed at financial rehabilitation, funded by a \$ 500 mn loan from the IBRD, and the other for the mitigation of environmental and social impact, supported by a \$ 63 mn IDA credit. The World Bank has selected 25 open cast mines in eastern India for modernisation under these projects. It is being claimed that with their successful implementation, Coal India's annual production will go up. As part of overall modernisation of Coal India, they will contribute to the projected increase in annual production to about 320 mn tons by the year 2004. While the IDA-funded project has already been discussed by the Bank's Executive Board, the more important, and expensive, IBRD-funded project is coming up before the board in December.

The IBRD loan of \$ 500 mn is linked with certain conditions, the following among which are significant: firstly, liberalisation of coal imports and reduction of coal import duty from 85 to 30 per cent to begin with; secondly, retrenchment of about 2,00,000 workers (regarded as surplus by the World Bank) out of Coal India's current staff of 6,76,000 which, according to Indian voluntary organisations, will affect mainly women workers; and thirdly, the opening of the coal sector to private investors to allow them to invest in new ventures.

Although Coal India's Environmental Impact Assessment Report promises new employment opportunities, access to health care and education, provision of facilities like roads, power, water, and electricity, to the oustees, past experience has revealed that most of these promised amenities never

reach the project-affected people. The latest IBRD-funded project will negatively affect 18,225 people, of which 10,928 will have to be resettled. Indirectly, in terms of livelihood and subsidiary occupations being followed by people in the affected area, it is likely to affect a larger number. At least 28 per cent of the affected persons are tribals. It may be recalled in this connection that the government of India-appointed committee on 'Rehabilitation of Tribals Displaced Due to Development Projects' in its report in 1985 had disclosed that less than 35 per cent of displaced people in the coal sector had been effectively rehabilitated. Further, the Operation Evaluation Department of the World Bank itself, while reporting on resettlement in 1993, admitted that "in India, the overall record is poor to the extent of being unacceptable".

Acknowledging that it is not possible either to give 'land for land' as compensation to the oustees or to offer enough jobs to all of them (only 2,803 jobs can be provided to the affected people), Coal India has hit upon an alternative package of self-employment schemes, under which these people will be given assistance to develop such options as engaging in dairy and poultry production, setting up shops and undertaking petty contracts, etc. But these schemes have been found to be non-viable in the past in most project-affected areas. Here again, the World Bank itself admitted in its review of projects involving resettlement during 1986-93, in a report that came out in 1994, that its experience with employment generation in resettlement cases "holds few clear signals on how to produce sustained development for the [displaced] people, especially when many of them have few of the skills needed for off-farm work".

The totally unimaginative rehabilitation and resettlement policy, which is completely divorced from the ground reality, has apparently been formulated without any close dialogue with the people who are going to be affected by the World Bank projects. As two local NGOs, the Jharkhand Janadhikar Manch (JJM) and the Chotanagpur Adivasi Sewa Samiti (CASS), have pointed out in their memorandum to the World Bank, the peculiar culture of the coalfields vitiates the possibility of real rehabilitation: "This culture is marked by the large amounts of money suddenly being available, inward migration into the area, political patronage, a close nexus between politicians and contractors, illiteracy..., the selling of illegal coal, co-opting resistance into the coal black market, unemployment, idleness, caste tensions..."

The success of the World Bank mining projects in boosting coal production will in course of time throw more and more people into the folds of the culture described above.

Round the Mulberry Bush

A SUBJECT on which the states were more or less unanimous at the meeting of the Inter-State Council on October 15 was centrally-sponsored schemes. The Sarkaria Commission itself had felt that while these schemes may not be done away with altogether, they "should be kept to the minimum in relation to the central assistance for the state plans", with the ratio to be determined by the National Development Council from time to time. According to the commission, while the union government may initiate pilot projects in state subjects with "inter-state, regional or overall countrywide significance but carrying high national priority", these projects should be formulated in prior consultation with the states and "once a programme has passed the pilot stage and has been accepted as desirable for implementation on a larger scale, it should appropriately form part of the state plan". Also, centrally-sponsored schemes should not be normally started in the middle of a Five-Year Plan.

At the recent meeting of the Inter-State Council, if there was divergence of views among the states on this subject it was on whether the centrally-sponsored schemes should be done away with altogether or be severely curtailed; there was no disagreement at all on keeping them to the minimum. Thus, while West Bengal was unreservedly for their abolition and suggested "transfer with funds of all centrally-sponsored schemes in state subjects to the states", and Kerala advocated "drastic reduction in amounts allocated" for such schemes "so that with increased united assistance the states can pursue their own development priorities", Karnataka, though regretting how these schemes had "ballooned with a vengeance as it were" after their number had been drastically cut (from 2,600 to 66) during the 1970s and arguing for these schemes to be "drastically pruned", felt that "as recommended by the Ramamurthy Committee and others, such schemes should strictly be restricted to not more than one-sixth of the central assistance".

Interestingly, or rather intriguingly, neither the opening statement of the prime minister and the home minister nor what the finance minister had to say in the course of his intervention throws any light on the centre's thinking on the subject. The Common Minimum Programme did speak of transferring "most centrally-sponsored schemes to the control of the state governments", but the phraseology used is subject to varying interpretations. Will the centre give up the past practice of having centrally-sponsored schemes in the Ninth Plan? If not altogether, to what extent will the curtailment go? Will this curtailment be

more in terms of numbers than the amount, as happened in the 1970s? The Common Minimum Programme speaks of abolishing poverty by the year 2005 and strengthening anti-poverty programmes and providing larger funds for a programme guaranteeing 100 days of employment for every unemployed person. It speaks also of the centre's responsibility to ensure access to drinking water and providing a shelter to every family by 2005. In the light of these statements it is not clear that the present central government is serious about winding down centrally-sponsored schemes, notwithstanding the strong demand from the states for their drastic curtailment.

IMF

Evading the Issue

THE Washington meeting of the IMF's Interim Committee is supposed to have "produced a consensus on the commitment of additional financial resources to enable the IMF to fulfill its mandate in the increasingly globalised economy". The question to ask is what concretely is it that the Washington consensus adds up to. Three things have been mentioned in this connection: one concerns the quota increase, the other relates to the borrowed resources of the General Arrangements to Borrow (GAB), and the third pertains to SDR allocation. Let us see what exactly the ministers gathered in Washington agreed to.

On quota increase, the question has been on the anvil for quite some time already as part of the so-called Eleventh General Review. IMF managing director Michel Camdessus did remind the ministers that the Fund's liquidity ratio, defined as the ratio of usable financial resources to liquid liabilities, "was expected to fall below what

has traditionally been regarded as the critical threshold of 70 per cent by the end of 1997 – the ratio's lowest level since 1983" and he did emphasise "how important it was for the IMF to maintain sufficient liquidity to give confidence to all members". In order to maintain the size of the IMF relative to the world economy, a quota increase of 100 bn SDRs over the current level of 140 bn SDRs was advocated by him. But what did the ministers agree to? All that Camdessus could report at the end of the day in regard to the Interim Committee's decision on quota increase was a call for "action to reach a conclusion" "as soon as possible". No time-table has been announced. No deadline has been set either.

On the other hand, on the question of doubling the resources of GAB to SDR 34 bn, which has been hanging fire since the aftermath of the Mexican crisis, some advance may be said to have been made in the sense that at long last the ministers endorsed the proposed increase and asked the Fund's executive board "to complete the work promptly". As regards new SDR allocation, all that was agreed to was to ask the executive board of the Fund "to work on an amendment to the Fund's Articles" which will enable a one-time allocation of SDRs based on "a common benchmark ratio of cumulative allocations to present quotas" – something that could possibly involve a fresh allotment of between SDR 16 and 26 bn. The board has been asked to finalise this amendment "by the time of the committee's next meeting".

Thus when one tries to add up, all that can be hoped for in the next six months to one year is enhancement of the GAB and a one-time allocation of SDRs, but no quota increase, however inadequate the size of the IMF may have become relative to the world economy.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

Nearly \$25 bn (Rs 81,690 crore) worth FDI approvals have been granted up to August. Of these, the bulk have gone into basic industries (34 per cent) including power, oil refinery, metals and chemicals and services (38 per cent) including telecommunications. Consumer non-durable industries have accounted for 13 per cent, while capital goods industries have attracted only about 10 per cent (even that may be an exaggeration as some items included under capital goods may in fact be consumer durables). Sourcewise, next to the US and South Korea, Mauritius tops the list because of its tax haven status. Delhi absorbs 23 per cent of FDI followed by Maharashtra's 15 per cent. Actual FDI flow since 1991 has reached Rs 17,880 crore or over \$ 5 bn.

LARSEN & TOUBRO

On the Upswing

ENGINEERING and turnkey construction major, Larsen & Toubro (L&T) posted a 30.6 per cent rise in net sales in 1995-96 with a similar rise in operating profit (up 30.4 per cent). Higher recourse to term loans, which increased by 73 per cent during the year, led to a 43.4 per cent rise in interest charges. However, a 17.7 per cent fall in tax provision over the previous year helped the company post a 40 per cent increase in net profit.

The company's debt-equity ratio has remained low, with debt amounting to only around 30 per cent of net worth, despite a sharp increase in long-term borrowings by the company. The current ratio, meanwhile, seems to have improved from 1.5 a year ago to 1.72 in 1995-96. There was an almost four-fold increase in the company's exports (including deemed exports). While earnings per share increased from Rs 12.1 to Rs 15.6, book value increased from Rs 90 to Rs 113.5 over the same period. The company's equity capital witnessed an 8.6 per cent increase following the conversion of GDRs offered earlier. Encouraged by its performance, the company increased the dividend rate from 50 per cent last year to 60 per cent.

Over a period of three years, from 1992-93 to 1995-96, the company's sales have almost doubled and its net profit has more than tripled. L&T is the largest engineering and construction company in the country with almost 60 per cent of its turnover and up to 54 per cent of operating profits coming from this division, which specialises in setting up engineering projects in the cement, fertiliser, food, power and chemicals industries. The other divisions have a kind of synergy with its main business – the cement division with a capacity of 6.1 million tonnes per annum; the construction division which makes hydraulic excavators, wheel loaders, vibratory compactors and loader backhoes; and the electronic and electrical division which offers switchgear equipment, control systems and telecom equipment.

Though the budget has not been kind to the company as far as input costs are concerned (freight, coal, power), the increased focus on infrastructure will benefit L&T in the long run. For the first three months of 1996-97 the company has recorded a 33 per cent rise in sales over the corresponding period last year. The order booking position also improved by 37 per cent to Rs 1,667 crore over the same period. The company plans to increase its cement capacity to 12 mn tonnes per annum (mtpa) by the year 2000. While this plant is to be commissioned by the end of this year, the 1.75 mtpa Tadpatri Cement Works in Andhra

Pradesh is expected to be completed in the second half of 1997. The company has signed a memorandum of intent (MoI) to form a 50:50 joint venture with Samsung Electronics of South Korea for the manufacture and marketing of a wide spectrum of telecom products including switches, transmission products, paging systems and EPABX. Also, Bhilai Power Supply, a company jointly promoted by L&T, SAIL and Community Energy Alternatives of US, has received clearances to go ahead with the project work for setting up a 450 MW thermal power plant. The company has identified power generation as a major area for diversification and plans to pursue power projects based on different fuels in various parts of the country.

CENTURY TEXTILES

Rise in Raw Material Costs

This B K Birla group company has fared well in 1995-96 despite pressure on margins due to a sharp increase in raw material costs. The company's textile division contributes 45 per cent to total turnover while the cement division and paper and rayon/paper grade pulp divisions account for another 34 per cent and 13.8 per cent, respectively. The company notched a 22.4 per cent increase in net profit on a 14.8 per cent higher net sales. This was despite a 22.4 per cent increase in manufacturing expenses mainly due to very high prices of cotton, which accounts for 54.5 per cent of total raw material consumed by the company. Other major raw material consumed by the company include wood pulp (13.6 per cent of raw material consumed), eucalyptus wood (7.5 per cent), limestone (6.7 per cent), gypsum, pulp, bagasse and sulphur. Prices of fabrics in the domestic and international markets could not keep pace with the rising raw material costs resulting in pressure on margins.

The cement division saw lower production of cement and clinker at 28.4 lakh tonnes and 24.5 lakh tonnes, compared to 29.7 lakh tonnes and 26 lakh tonnes, respectively, in the previous year. This was mainly due to a planned shutdown of 40 days at the plant at Manikgarh (Madhya Pradesh) for upgrading and increasing the capacity to 15 lakh tonnes per annum and an acute shortage of power commencing from September 1995 in the state. Though production of rayon yarn was marginally higher, margins continued to remain under pressure due to increased input costs and competition in the domestic and international markets. Production of tyre cord dropped to 3,509 tonnes mainly due to lower domestic consumption and a 50 per cent increase in excise duty on deniers. Birla Tyres, a unit run by a consortium of four companies in

which Century Textiles has a 60 per cent interest, has turned around during 1995-96. This tyre unit achieved a capacity utilisation of over 95 per cent with improved productivity and reduced waste.

The company managed a 32.5 per cent rise in operating profits with a tight leash on operating expenses. Though the company's total term loans increased by 15 per cent during the year, interest costs flared up by 43.4 per cent over the previous year. However, a closer look at the structure of loans shows that the company has availed of a larger proportion of short-term loans (up 135 per cent) during the year under review as compared to 1994-95. The company's earnings per share (face value Rs 100) improved from Rs 342.2 in the previous year to Rs 418.6 while its book value moved from Rs 1,970 to Rs 2,328 over the same period.

For the first quarter of 1996-97, the company has posted a 15 per cent growth in sales and a 17 per cent increase in exports over the corresponding period last year. The company plans to set up two 15 MW captive thermal power plants at a total cost of around Rs 100 crore in order to cater to the requirements of its cement plants. It is also setting up a 100 per cent export oriented unit (EOU) for manufacturing denim. The project, which will have a capacity of 10 mn metres per annum, is estimated to cost Rs 100 crore. The company is also setting up a 3-lakh tonne per annum pig-iron facility in West Bengal at an estimated cost of Rs 250 crore. Another Rs 150 crore will go towards the paper projects taken up by the company in Punjab and Uttar Pradesh.

The company's share price currently quotes at around Rs 2,935 discounting its 1995-96 earnings per share seven times.

BOMBAY DYEING

Tale of Woe

Bombay Dyeing, the Wadia group flagship which is the country's leading manufacturer of di-methyl terephthalic acid (DMT), saw mixed performance during 1995-96. While net sales increased by 28.9 per cent and net profit was up 19.4 per cent for the entire year, the company's performance in the second half of the year was a cause for concern. This was mainly due to the new capacities that have become operational in the domestic polyester industry which is already burdened by excess supply. The poor offtake of polyester yarn by synthetic weavers led to poor demand for DMT and with stocks piling up, producers like Bombay Dyeing were left with no option but to slash prices from about Rs 55,000 per tonne to around Rs 35,000 per tonne. A softening in

prices of DMT in the international arena following the withdrawal of China from the fibre and filament market and a consequent fall in all raw material prices also did not help matters. With DMT contributing more than 60 per cent of the company's turnover, it is not surprising that the company's margins came under severe pressure during the year. The sharp increase of 46 per cent in the division's turnover was more due to increased production than due to increase in realisation. Production increased from 113,773 tonnes to 134,540 tonnes as the capacity of the DMT plant was raised from 120,000 tonnes to 145,000 tonnes. The textile division, which contributes 35 per cent of the company's turnover, also performed poorly with cotton prices remaining extraordinarily high for a major part of the year. Severe competition from west and east Asia as well as Africa, which produce better quality material at lower costs, saw a sharp fall of 21.3 per cent in the company's exports during the year.

In the current year as well nothing seems to have gone right for Bombay Dyeing. The company, in order to cut costs, decided to source its paraxylene requirements from contracts instead of from the spot market. Paraxylene accounts for up to 57 per cent of its raw material requirement, the other major raw material required being cotton (21.6 per cent), methanol, fibre, yarn, dyes and chemicals. Unfortunately, the spot prices went below contract prices resulting in the company paying an 18 per cent premium price for over three months. The import duty cuts in DMT from 35 per cent to 27 per cent in the 1996-97 budget and a 2 per cent additional duty on the import of paraxylene added to the company's woes. Further, the prices of purified terephthalic acid (PTA), a substitute for DMT which also yields a better input-output ratio, rule almost equal to prices of DMT.

Meanwhile, the company's DMT plant at Patalganga had to be shut down for more than a month during the current year due to technical problems leading to a decline in turnover during the period. For the first three months of the current year the company saw a 37 per cent drop in turnover over the corresponding period last year from Rs 352 crore to Rs 222 crore. Export of textiles for the same period, however, was higher by Rs 2 crore at Rs 50 crore over the same period and the company expects an export turnover of Rs 220 crore in 1996-97 compared to Rs 175 in the previous year. The company also plans to set up a captive power plant to cater to the requirements of its plant at Patalganga as the current outgo due to power tariff is very high.

The company's share price, in the meantime, has plummeted to around Rs 122 discounting its earnings per share (EPS) for 1995-96 by a mere four times.

Paradigms of Development and Distances between Nations

Arun Ghosh

The 'globalisation' of the world is inevitable; new technology has already brought it about. But we must all bend our minds to determining how the benefits of new technology can be reached to the entire humankind, instead of enhancing the 'distance' between peoples and nations.

IN his Introduction to the volume by the Patels on *Development Distance between Nations**, Richard Jolly, deputy executive director of the Unicef says, "The message of these papers is one of hope, possibility and challenge. The historical record has made clear that rapid progress is possible; it has been achieved in country after country; at least with respect to the basics of material progress, human development and human rights and gender. Now the end of the cold war gives the world the potential for further progress, in part by shifting from international pre-occupation with maintaining security to international pre-occupation with creating the conditions for peace and development. This is the challenge..."

Jolly's remarks are well taken, but regretfully one has to say that it is after the cold war had ended that there has emerged a new international economic order (reflected in a regime of TRIPS and TRIMS and GATS, overseen by the WTO, a sort of club of the industrially powerful countries); and that this regime is calculated to impose a new type of 'Imperialism', seeking to keep the laggards in the race for economic development in a state of backwardness. Jolly's views reflect the views of the enlightened, the 'liberal' in the developed world. Unfortunately, since the 1970s, they are in most places a minority, at least a minority among those who wield authority, and in many other places a silent, quiescent, passive majority. Regretfully, as of today, these views do not count, when it comes to taking 'affirmative action' – as V P Singh puts it – to bring about conditions of genuine human dignity and human development across the world.

What is it that leads to economic development? Perhaps we, the educated in society, need to ponder, to sit back and think. What are the roots of economic development? And let us be clear from the outset that social and economic development have historically

gone together. That is an empirical fact, as the history of all economically developed countries bears out. We need not argue the point here on logical grounds.

As Surendra Patel has emphasised, through most part of human history, "mankind has spent its energy in making a living – finding food, clothing and shelter"; and it is only in the last century or so that mankind has made rapid strides in improving standards of living mainly in the industrially advanced countries of the world. Surendra Patel adds, "in the process the age-old affliction was swept away from the centre to the fringe", that is, from the developed countries of the world to the laggards in the race for industrial development.

Why do we suddenly bring in the phrase 'industrial development', while we were speaking of economic development earlier? Because, it is in the industrial process that rapid strides in increasing labour productivity are possible. Indeed, in some ways, it is through industrial progress – certainly, scientific-cum-technological progress, including industrially produced inputs for agriculture – that rapid strides even in agrarian production are possible. It is essentially new technology which increases labour productivity, which enables humankind to produce enormous output at a fraction of the labour required earlier, for providing the consumption needs of the people. Let us talk of 'technological innovations' as the means of progress, though, as Adam Smith pointed out as far back as 1776, it is essentially in the process of industrial production (rather than in agriculture) that greater division of labour, greater specialisation and therefore higher labour productivity are easily possible. Greater specialisation, greater division of labour, better technology and better tools and equipment used by labour in the process of production are the founts of the large output of goods and services now available to humankind for its use.

So, what is it, in the final analysis, that leads to economic development? Human beings have toiled for their very existence from the dawn of human civilisation, and it is only in the last couple of centuries that

significant changes in output arising from human effort have come about. The root of economic development is technology – in other words, 'knowledge' – and the application of new knowledge, new technology to human effort.

PUBLIC AND PRIVATE PROPERTY IN KNOWLEDGE

More than 75 years back Alfred Marshall wrote presciently: "Knowledge is our most powerful engine of production... Organisation aids knowledge..." Marshall went on to add, "the distinction between public and private property in knowledge and organisation is of great and growing importance; in some respects of more importance than between public and private property in material things..." [Marshall 1920:138-39].

The importance of knowledge in economic development has been recognised by many economists. It was really popularised by Piero Sraffa (1926) and Allyn Young (1928) who talked of 'increasing returns' as a distinct possibility, nullifying the then popular supply-demand-equilibrium theory. Of late, Theodore Schultz has emphasised the importance of investment in research (new knowledge) even in the sphere of agriculture, with possibilities of very high returns on such investment (1988).

But Marshall's prescient observations in regard to "the distinction between public and private property in knowledge and organisation" has of late become an extremely relevant issue. Let us go back in history. Let us give a few (brief) quotations from E J Hobsbawm (1987). Up until the beginning of the 19th century,

In terms of production and wealth, not to mention culture, the differences between the major pre-industrial regions were, by modern standards, remarkably small... between 1750 and 1800 the per capita gross national product in what are today known as the 'developed countries' was substantially the same as in what is now known as the 'Third World'...

Technology was a major cause of this gap (in per capita incomes, which by 1913 had reached the ratio of 7:1), reinforcing it not merely economically but politically... the industrial revolution which penetrated warfare in the middle decades of the (19th) century... tilted the balance even further in favour of the 'advanced' world by means of high explosives, machine-guns and steam transport...

The clearest distinction between the two sectors of the world was cultural, in the widest sense of the word. By 1880s, the 'developed' world consisted overwhelmingly of countries of regions in which the majority of the male and increasingly the female population was literate...

Dissemination of knowledge, of skills was the basis of widespread economic development in what is now the 'developed' world.

* Surendra J Patel, Krishna Ahooja-Patel and Mahesh S Patel, *Development Distance between Nations*, Ashish Publishing House, New Delhi, 1995.

But now there is a new trend, worldwide, of developed countries wanting to keep a 'monopoly' over knowledge, over technology, through what has come to be known as Trade Related aspects of Intellectual Property Rights (TRIPS) enforced by the World Trade Organisation (WTO). This attempt is essentially a part of:

"The simple plan,

That they shall have who have the power,
and they shall keep who can."

To an extent, it is a futile exercise, because 'knowledge' cannot be kept back; it is universal. But the task (of development) becomes all the more difficult for the 'haves-nots' of the world, if the rules of the game are so fashioned as to keep the backward in a state of backwardness. That is, regrettably, as true nationally as internationally; and one must add that the latter would not be possible without the former. The present WTO regime, with its focus on intellectual property rights, on the free inflow/outflow of capital (on the specious plea that both are 'trade-related') even as the migration of labour is not part of this whole, on trade in services (GATS) – an area where developed countries have acquired increasing superiority and comparative advantage and expertise, through revolutionary discoveries/inventions in information technology, even as they have been losing out in competitiveness in traditional manufactures – together with increasing pressures on developing countries in the matter of environmental problems, of 'social clauses' including low wages (in the early stages of industrialisation), of mandatory 'market access' for the products of developed countries, of an extremely one-sided Disputes Settlement mechanism under the new WTO regime, all these are manifest attempts of the politically, economically and militarily strong countries to keep the present laggards in the race for economic development in a state of 'dependency' and underdevelopment.

This attempt is not likely to succeed for two very important reasons. First, fortunately, even among the industrially developed countries, there are some countries – and many pressure groups within others – which are imbued with a truly 'liberal' spirit and philosophy. Secondly, since the majority of the world population – may be some two-thirds – which may today be classified as part of the 'third world', with much of the former 'second world' now joining the ranks of the 'third world', it would certainly be naive to think that they can be kept back perpetually.

Perhaps progress is cyclical, much like the way Nature behaves cyclically. Perhaps the present generation is witness to a cyclical period of increasing disparities in the state of knowledge, of economic development in the world. This is not mere idle optimism; this possibility is embedded in the very

process of the evolution of mankind, historically.

EACH COUNTRY IS DIFFERENT

But economic development just does not 'happen' automatically. And the point to note in this context is that the problems of each country are different; the solutions to each country's problems are also embedded in the socio-political framework of each country, its resource endowment, its 'location' in the confluence of the geo-politics and geo-economics of the rest of the world. It is for these reasons, that the optimism of Surendra and Krishna-Ahooja and Mahesh Patel – the optimism reflected in Richard Jolly's Introduction to the volume needs to be tempered, first, because each country needs to pull itself up, in the context of how it is 'situated'; and secondly, because the impediments to the required efforts are not only internal but also external, and the latter are quite powerful.

What is it that needs to be done today? The very framework of societal organisation is vastly different in different countries; and much as one would like to think and talk in international terms, much as one must acknowledge the universality of the fast changing world in terms of means of communication and the coalescing of geographic distances, one must also ponder about the cultural roots of different peoples, their vastly different approaches to life and living, and then come up with economic alternatives to meeting different societies' needs for a better life.

Let us digress for a moment. The August 1996 issue of the *National Geographic* (a fascinating journal published by the National Geographic Society of Washington, DC) deals entirely with Mexico, with the geography, society, life and living conditions in, as the editor of the journal explains at the outset, different parts of this "arduous landscape of peaks and valleys rising and falling like the country's tumultuous history". The editorial goes on to say: "Today Mexico's 95 million people seem poised for another momentous change. Rich in natural resources, blessed with strong family ties and a hardworking populace, Mexico is ready to move from the ranks of developing nations into a new role, this time as a modern player on the world stage." So goes the editorial. But, in the very first article, some of the problems of Mexico are neatly summed up, in the dancing of rebel kids on New Year eve in 'Reality, Mexico': "Desperate, poor, reeling from setbacks but still determined to win their cause of land reform and representative government, they are like most of Mexico. And, like Mexico, they may appear to be just dancing, but actually they are poised, waiting for a momentous change... Across Mexico people are waiting. Driven by the decay of the old political order, by the pressure of financial disaster, by modern links to the outside world, and by a gradual

building of agitation at all levels, change seems inevitable. But its direction is unknown..."

We have digressed, but the digression was deliberate. Mexico has a longish border with the US; and it is now a part of NAFTA. But has any neutral observer examined what NAFTA really implies for Mexico on the one side and the MNC interests in the US on the other? Will not NAFTA help essentially the US-based MNC interests, at the cost of the people of Mexico? As we have seen, Mexico is not short on natural resources nor on the industry of the people. But, what will be the focus of and what the constraints on the Mexican government under NAFTA? If one peruses the history of the Mexican peso over the past 20 years, say, from 1976 to 1995, if one goes back to the oil boom of the 1970s and early 1980s and Mexico's booming economy of those days, if one examines the strange flight of capital from Mexico when the going, on the import-intensive industrial production front, was not so good following the long recession in the US and western Europe during the 1980s, if one really goes back to some of the basics – as the *National Geographic* has attempted to do – one begins to realise the dangers of the New Imperialism that is now beginning to threaten world peace and world order.

Let us go back to one last quotation from the *National Geographic* and then return to our theme:

The patterns people have left over the past 500 years of living and working on this land tell a single story. Across a geography shaped by fire, flood and blowing sand, Mexicans have woven a complicated tapestry of village, city and farm vastly different from the disciplined landscape to the north of the border.

In the US and Canada, geometric boundaries make a checkerboard on the land that looks printed by a machine. But in Mexico every field has its own shape and each road its unexpected curve...

It is this tapestry that many experts and intellectuals, convinced of their superior knowledge on the basis of their superior technology, are unable to either understand or appreciate. They would like, at one stroke, to redraw the boundaries (of, say, farms) in large, geometric patterns (suitable for, say farming commercially, using a variety of modern equipment). That in the process thousands, sometimes millions, may get uprooted, displaced and dehumanised, does not appear to bother them. Even in a societal framework where alternative employment can be found for those displaced – as in the erstwhile USSR after the communisation of agriculture, diverting agrarian labour to industrial production – there is an enormous cost; but where there are no alternative employment opportunities, progress for a few can imply destitution for many. That problem appears to be receding today in the calculations of international capital and therefore of developed countries.

When the talk of paradigms of economic development, what precisely do we mean? There have been several phases of economic development of the world in the past, each of them reflected in the social and economic thinking of the times. What are these paradigms of thought? Let us start with Adam Smith, whose concern was with the nature and causes of the wealth of nations. Adam Smith was the inheritor of Hume's philosophy of liberalism and of Bentham's philosophy of utilitarianism; and he saw increasing division of labour (mainly in the manufacturing process) as the source of productivity increases, the size of the market limiting the extent of the division of labour and of production capacity. The 'enlightened self-interest' of every individual in a free market would maximise output, and the satisfaction ('utility') of every individual. Hence, the focus on free trade, on free markets. One must add though that Adam Smith was also concerned greatly with two issues where he categorically refuted the free market principle. One involved the build up of social and economic infrastructure which he thought was one of the essential 'Duties of the Sovereign' (or the Commonwealth). The second is where Adam Smith's moral sentiments prevail over his theory of wages. To quote Smith, "No society can surely be flourishing and happy, of which the far greater part of the members are poor and miserable. It is but equity, besides, that they who feed, clothe, and lodge the whole body of the people, should have such a share of the produce of their own labour as to be themselves tolerably well fed, clothed and lodged." Exponents of modern neoclassical theory, especially those who see in the untrammelled operation of the market system the panacea of the world, would do well to re-read Adam Smith, the first (and the chief) exponent of free market theory.

CHANGING WORLD ECONOMY

From Smith, let us take a brief look at Malthus and Ricardo. As Surendra Patel reminds us, "The world economy in the pre-1850 period provided a classic illustration of the model of 'dynamics of political economy', as elucidated by Ricardo, Malthus and Mill. 'The power of population' marched almost in line with the 'power of production'." But the Ricardian paradigm was not that simple. Since wages tended to be fixed at the subsistence level, there arose a 'surplus'; and this surplus added to the savings in the economy which helped the savers to invest in and to produce new capital equipment. That in turn increased output. Ricardo saw the salvation of the world in increased capital accumulation which would help to increase output.

Karl Marx merely took the Ricardian labour theory of value to its logical conclusion. But Marx went further, digging

into the Hegelian philosophy of dialectics, and the historical evolution of social relations. It is Marx's clear distinction between the 'emergence' of surplus value and its 'realisation/appropriation' which led to capitalist development. Economic growth depended upon accumulation, and accumulation depended upon the realisation of surplus value. And, for the realisation of surplus value, the existence of an 'industrial reserve army' was essential.

But, though Marx rejected Say's Law (that supply creates its own demand), he neglected to note the possibility of overproduction (in relation to demand), and therefore of cyclical fluctuations in output under the capitalist system. (This was one of Rosa Luxemburg's main critiques of Marx.) It is for this reason that he saw the inevitability of a mature capitalist system getting replaced by socialism. This was not likely to happen automatically, inevitably; it required a proletarian take-over of the production process.

That things do not always work out as predicted, is amply proven by history. Socialism came, not in developed capitalist countries, but in a pre-capitalist, feudal (in fact, monarchical) society, in Russia, in 1917. In China also, socialism triumphed in a country with a war-lord, country-lord nexus, where 90 per cent of the population was rural and a higher percentage was poor, where industry was in its infancy. So, indeed, was the case in Cuba. In Viet Nam – apart from that country being an essentially agrarian society – socialism came after a long-drawn struggle against outside powers, including the mightiest military power in the world. So much for predictions.

But, to return to the paradigms of economic thought, which in a sense reflected the socio-political-economic conditions of society, the 'Jevonian Revolution' (as Maurice Dobb calls the marginalist analysis) of the 1870s brought up the demand-supply-equilibrium theory. Wage rates (in England) were no longer determined by mere subsistence needs. The industrial demand for labour was pushing up wages. The Benthamite 'utilitarianism' came in handy for the exposition of a 'subjective theory of demand based on utility' (of consumption) to individuals; and Jevons in England (1871), Carl Menger in Austria (1871) and Leon Walras in Switzerland (1874) evolved a wholly new paradigm of thought in economics. The revolt was against Ricardian thought in England and against Marxian thought in Germany.

But, what was the social process which induced this deviation from classical economic theory? Industrial production was rising not only in England but also in Germany and France, and had commenced in the US also. By this time, British colonies were well established, and so were many French, Portuguese, Dutch and Spanish colonies. (The German and Belgian colonies came a little later.) Raw materials for

Industrial production were flowing in from all over the world, and new markets for manufactures were opening up. The demand for industrial labour had pushed up wage rates above the subsistence level; and though unemployment still existed – the Marxian 'reserve army of labour' – yet a refutation of Marxian doctrines (to keep down industrial unrest) became necessary. Historical facts negated the principle of wages always being at the subsistence level. Leon Walras' general equilibrium theory was a reflection of the need to find a new structure, a new logic of economic theory in order to promote the process of capitalist growth.

We set aside the Austrians, the Swedes, Schumpeter – with his path-breaking exposition of the concept of 'innovations' – explaining the dynamics of the growth process, and jump to John Maynard Keynes. The depression of the 1930s was the forerunner of Keynesian theory; and even though Kalecki (in Poland) was saying much the same things, it was Keynes (1936) who established conclusively that classical theory had no explanation for the continued underemployment of resources. Though Keynesian policies were pursued by Franklin Delano Roosevelt in the US from 1933, even prior to the Keynesian exposition, the flowering of Keynesian economics really came after the second world war, when even the developed capitalist countries accepted the need for state intervention for ensuring economic growth, even under the capitalist system.

The refutation of Keynesian policies and a revival of neoclassical theory prescribing minimum state intervention (*a la* F A von Hayek) came in the 1970s, and more particularly in the 1980s. The reason, again, has to be sought in the socio-economic history of the world. The proliferation of Eurodollars, especially during the 1960s – which brought about the abandonment (1971) of the Bretton Woods system of fixed exchange rates, with a parity with gold – and later the profusion of petrodollars from the mid-1970s (after the oil price hike by the OPEC) made for a new experience in industrially developed countries, 'stagflation'. The first casualty was the Keynesian policy of 'pump-priming'. Tighter fiscal and monetary management, in order to enforce the stability of prices in the face of continued expansion of international finance capital, followed. Reagan and Thatcher perfected the Hayek-ian philosophy of privatisation (on the premise that all governmental activity is necessarily bad for society). But government control, in a sense, became tighter: rigid price stability must be maintained, no matter what the costs to the bulk of the population. That the east Asian countries were rapidly growing as a result of all-pervading government intervention was ignored. What was good for western Europe and the US must be good for the world. Economic theory has to be bent to suit the conditions of the OECD countries.

We come to the final stage in this story, the saga of economic development around the world. There are limits to home markets in the developed countries. Technological changes, particularly in informatics and biotechnology, are also changing the nature and competitiveness of production around the world. The industrially developed countries are no longer competitive in traditional manufactures. Their competitiveness now arises in 'services', in new areas of production. Hence the transformation of the GATT to the WTO, with its focus on Trade-Related aspects of Intellectual Property Rights (TRIPS); on Trade Related aspects of Investment Matters (TRIMS); on Trade in Services (GATS); on the concept of 'market access', as opposed to competition; on new mechanisms of Disputes Settlement under the WTO (controlled by the developed countries), including 'cross retaliation' in any area of economic activity, with the burden of proof of not doing damage resting on the accused party, a wholly new concept in international jurisprudence.

All these measures are clearly calculated to halt the development of countries which are laggards in the race for economic development. Through the past two centuries, industrial growth has proceeded on the basis of 'reverse engineering'. 'Knowledge', new technology, has been disseminated thus. It suited the western powers to permit this process in Japan, in South Korea, elsewhere, to contain the expansion of Soviet and Chinese influence on developing countries. Large volumes of Official Development Assistance also flowed freely for much the same reason. But that is no longer necessary, or even to be permitted. Marshall's prophetic words in 1920 now ring true. "The distinction between public and private property in knowledge is of great and growing importance." In fact, public property in knowledge is bad, because all government is bad; private property in knowledge is good because that is what a private market economy is all about. That the modern processes of production lead to 'monopolies', that the very concept of Intellectual Property Rights is a direct (and a forceful) perpetuator of monopolies, is totally ignored. That totally free movement of capital in the absence of any free movement of labour is iniquitous, is also ignored. The developed countries must have free access for the capital of their MNCs in developing countries, though the latter's labour cannot migrate to the developed countries.

That, in essence, is the new international economic order that has been imposed by the developed (and economically powerful) countries of the world. This is the outcome of the long-drawn negotiations under the Uruguay Round, commencing in 1983 and culminating in the Marrakesh Agreement of 1994. Threats, cajolery, small attractions (to weak countries and their weaker political

representatives), all such means are fair in this struggle for economic supremacy and domination.

Why do we bring up this story in a review of the Patels' vision, of their dream? There are two good reasons. The 'development distance between nations' has certainly been overcome in many matters, by a large number of countries. That distance has increased for an even larger number of countries. Surendra Patel acknowledges the problem in the concluding chapter. "There are too many poor people in the south", he says. "The scale of malnutrition and hunger is enormous". (This in a world where food is periodically burnt in order to keep up prices, where farmers are subsidised by states to leave their farms uncultivated.) Surendra Patel continues, "the distribution of income, and more particularly of wealth and economic power, is highly unequal. The economic distance among the countries of the south has increased."

These are all hard realities, facts of life. Yet Surendra Patel is optimistic. These weaknesses "remain to be overcome in the decades ahead".

We are all optimistic; cynics do not bother to give expression to their views, for they look at the world sardonically. But mere optimism is not enough; optimism has to be mixed with a concrete plan for 'affirmative action' (as V P Singh has stressed in a lecture delivered at Harvard in September 1995). This is no place for outlining the elements of such affirmative action today. Yet, two brief points do emerge which need to be stressed.

STRATEGIES FOR THE SOUTH

We come to the conclusions of this essay: the two reasons why we have outlined, very briefly and selectively, the socio-political-cum-economic history of the world, over the past two centuries. As Surendra Patel says, "the strategies needed for the final stretch of the development process in the south will have to be shaped by each country, taking into account its own specific conditions – resources endowment, labour force, development level and cultural and historical inheritance of its people". That is of the essence. This realisation must be brought home to the people, to the political representatives of the people. Let us not be swayed by the judgment of experts who sell their brains only for the fat pay packets that the World Bank and the IMF can afford to pay (at the cost of poor borrowing countries). Let us resolve that each nation would seek solutions to its problems on the basis of what the people of each country desire.

The second reason for this (rather long) narration of the well known, the obvious, is that through this column – and since the EPW has an international circulation among intellectuals – the appeal from all developing countries to intellectuals in all developed countries is: please try to look at the problems

of the third world through the eyes of the third world. The 'globalisation' of the world is inevitable; new technology has already brought it about. But, we must all bend our minds to determining how the benefits of new technology can be reached to the entire humankind, instead of enhancing the 'distance' between peoples and nations.

As a post-script, and perhaps as a bit of an anti-climax, it is necessary to add that two essays, one by Krishna Ahooja-Patel (on gender inequalities) and the other by Mahesh Patel (on issues of health) are superb expositions on these issues. But that is the relevant point, in a way: there are two distinct and yet inter-related issues in the development process – internal constraints and external constraints. We have been concerned here primarily with the latter. But the former are equally, in fact more, important. They are for each country to resolve; and once these get resolved, external constraints – which are really for the world community to resolve – become so much the easier to tackle. In the final analysis, development depends on the will of the people.

Importance of Indigenous Knowledge in IPR System

Suman Sahai

Now that bioresources are becoming a highly sought after raw material in the era of biotechnology, we must create a framework for the just and proper use of and appropriate payment for indigenous technology. We need to address ourselves to a few important aspects in order to lay down a comprehensive national policy in this regard.

THE importance of indigenous knowledge can be understood when one realises that there are no rice or wheat plants nor cotton or mustard found lying around in the forest. What are found in the forest are wild plants out of which communities of men and women over generations have bred races of several food and cash crops. These communities have bred out of the wild plants of the forests, the thousands of land races which are the basis of the world's agriculture. The land races bred by farming communities are the foundation material of modern plant breeding and global food security. These land races are the self-same varieties that plant breeders use to breed other varieties and for which they seek special and exclusive privileges like Plant Breeders Rights.

It needs to be remembered that farm women and men have not only created several thousand races of food and cash crops, they have also identified valuable genes and traits in these crops and maintained them over generations through a highly sophisticated system of crossing and selection. Communities have not only developed complex systems of pest management and biological control, they have identified and managed a series of genes conferring valuable traits for commercial and domestic needs. So it is that genes for traits as diverse as disease resistance, high salt tolerance, resistance to waterlogging and drought tolerance have been maintained in the repertoire of communities. Along with these commercial traits, characteristics like cooking time, taste, digestibility, milling and husking characteristics like how much grain breaks during milling operations are recognised and maintained. Women who have been the traditional custodians of the seed and responsible for its selection, are the repositories of this knowledge and in the true sense owners of this complex seed technology and know-how.

This work of genetic selection, maintenance and cross-breeding is the result of innovative and creative scientific experimentation in the field. This work is in no way less than the scientific experimentation conducted by scientists in the experimental plots of agricultural research stations.

We need to overcome the bias that most of us suffer from, that of acknowledging the research conducted by scientists in white coats working in laboratories of universities as 'science' and dismissing the complex knowledge systems contained in rustic, rural communities as something infinitely less and not worthy of acknowledgement.

The fact is that there would be no plant breeders in long white coats working on experimental farms if it were not for the prior knowledge gained from rural communities. Indigenous knowledge is not only the foundation of modern science in this and many other fields, it is also what could be described as the reference and referral centre for modern plant breeding. Today, faced with the threat of global warming and climate changes across agricultural zones, scientists are on the look out for crop varieties that are more heat tolerant. The scientists do not acquire information about the location of heat resistant wheat or millet varieties by sitting in their expensively appointed laboratories and meditating for guidance. They acquire this information by going to deserts and hot regions and asking local farming communities about the varieties that grow in that region and that can withstand extreme heat. Armed with the benefit of indigenous knowledge, these scientists return to their labs and their experimental farms and engage in a breeding and selection programme that will result in the combination of traits that they seek to achieve in the new variety that is to be designed for post global warming agriculture.

If credit had to be apportioned for the breeding of a new crop variety, then it could be shared perhaps as 70:30 or at least 60:40 between the farming and scientific communities. One could say quite easily that if the breeding of a crop variety entailed 100 steps, then indigenous knowledge contributed the first 70 or 60 steps and laboratory science contributed the next 30 to 40 steps. It stands to reason therefore that credit, reward and recognition for a new variety should be similarly shared. That is the reason why the claim to place Farmers Rights on par with Breeders Rights is such a natural claim. Farmers have a greater and

more innovative share in the creation of new plant varieties than scientists. Their contribution must be recognised with at least the same degree of enthusiasm, if not more than that accorded to scientists.

The role of indigenous knowledge in the realm of medicinal plants is even more obvious than in the case of crop varieties. Knowledge about the characteristics of a particular plant and its properties as a healing substance, or stated differently, the technology of its use, is what gives medicinal plants their social and economic value. This technology of use has been acquired through a few thousand years of experience, trial and error and incremental refinement. As a result of this, communities have developed the knowledge of the plant, animal and mineral world to a mature and scientifically sound technology which exists in several forms, the best known of which is perhaps Ayurveda. Apart from Ayurveda, knowledge of the healing properties of plants is found in communities that live around the forest or close to nature. Tribal communities, island communities and others have developed their own knowledge base about the flora, fauna and mineral wealth of their region and use this knowledge to their socio-economic advantage.

It stands to reason that the technology pertaining to the medicinal uses of plants and animals belongs to indigenous communities and must be considered their property. It must be considered to be their property in the same way that a technology for making high grade chrome steel is considered the property of the Japanese company that developed it. It stands equally to reason that when someone wants to use indigenous technology to produce medicines from medicinal plants, they must first ask for permission and then agree on terms of payment for the use of this technology. When a company like Dabur or Baidyanath commercialises community knowledge and benefits financially from it, it should certainly pay royalty or make an arrangement for profit sharing. This would be even more the case if foreign companies wanted the use of this technology.

If a pharmaceutical giant like Merck were to show interest in the production of medicines based on ayurvedic or tribal knowledge, it would explore the forest wealth of regions like India and Costa Rica via the local vaid or shamans. The scientist from Merck cannot make head or tail of medicinal flora when he is bio-prospecting, if he does not have information from the vaid or the tribal ojha. Merck will begin to look for a cure for stomach ulcers in plants that local vaid use for stomach ailments that resemble the allopathic definition of ulcers, and not in plants that they use for ailments of the eye. The scientist from Merck could not enter a tropical forest on his own and choose random plants, saying for example, the

creeper with blue flowers could yield drugs against cancer or the shrub with yellow flowers could contain ingredients effective against diabetes. The plants in the forest or in the field, or for that matter along the banks of rivers or on the roadside, have value only because people have the special knowledge about their characteristics and the range of their utility. It is clear that Merck must pay for this technological know-how.

It stands unequivocally established that biological resources have a value only when accompanied by the technology of their use. It is equally clear that bio-prospecting as an activity is only possible when indigenous technology is made available to those seeking access to biological resources for commercial use. Now that bioresources are becoming a highly sought after raw material in the era of biotechnology, we must create a framework for the just and proper use and appropriate payment for indigenous technology. At present the awareness and acceptance in India is inadequate with respect to the recognition of indigenous knowledge as valuable technology with a high price.

We need to address ourselves to a few important aspects in order to lay down a comprehensive national policy in this regard. These can be listed as follows:

(1) *Documentation of the location of biological resources at the regional and national level:* Unfortunately, this task entrusted to the Botanical and Zoological Survey of India (BSI and ZSI) has met with less than dazzling success. It could be said that BSI and ZSI are reasonably clueless about the current state of India's flora and fauna. This must be rectified immediately if we are to use our bioresources as the foundation for national growth. We must at least know where we have what, whether previously recorded populations of plants, animals and insects are healthy, threatened, on the verge of extinction or already extinct.

Along with the documentation of the bioresources, we must *document the local community knowledge* that exists about the various uses of these resources. This documentation which should be compiled as a *National Bioresource Register* will serve several functions.

(a) The first is that of a data bank for people seeking access to information. This access should be made available for a fee accompanied by the conditions governing the use of this information. This is the normal practice with data banks everywhere.

The fee for bio-prospecting must be levied and be paid into a *Community Gene/Technology Fund* in the dispensation of which, representatives of communities will have a say. It would be advisable to have a basic fee for the right to prospect irrespective of whether a viable product emerges from this exploration. A profit sharing formula should be worked out in addition, if a commercial product is developed, to pay for the use of Indian raw material and Indian/Indigenous technology.

(b) The documentation can be used to stake the claim of communities or individuals for royalty payments for the transfer of indigenous technology. This data base can also be used to identify communities which should be included in the National Authority that will govern the use of bioresources and implement conditions of the Convention on Biological Diversity (CBD) like Prior Informed Consent and Material/Information Transfer Agreements.

(c) Finally, this data bank will serve the important function of establishing community knowledge firmly in the public domain. This will provide the technical basis for rejecting patent claims that derive from indigenous knowledge. The recent furore over the American patent granted on the wound healing properties of Haldi is a case in point. As is also the patent granted to WR Grace for a Neem-based pesticide. *Phyllanthus niruri*, called Bhoomi Amla in India is known in several Asian countries for its efficacy in treating liver ailments. A liver medication extracted from *Phyllanthus* has been patented by Bloomberg (US), obviously derived from the traditional knowledge of Indian/Asian communities. All these patents should have been challenged on the grounds that they derived from knowledge/technology owned by indigenous communities. Furthermore, this knowledge was used unlawfully without either Prior Informed Consent or Material/Information Transfer Agreements; therefore a strong case exists for annulling these patents.

If India is to protect its interests, and the interests of its indigenous communities, it will have to be aggressive and proactive in laying down the guidelines governing the use of bioresources. It will then have to act resolutely to challenge any infringements. Apart from challenging the grant of patents in other countries, it would be advisable for Indian legislation to include clauses barring the grant of patents on any products or processes derived from indigenous knowledge. The knowledge of communities must remain in communities and not be privatised.

(d) We must ensure that the information that is documented is banked in a government-owned repository and is legally admissible in a court of law as evidence for prior knowledge. In order to strengthen the claim of indigenous communities over their knowledge base, our laws must admit Oral Tradition as documentation of use. This will be of importance when dealing with knowledge other than that documented in Ayurveda, like tribal knowledge or the knowledge existing in far-flung island or hill populations.

(2) *Drafting of national legislation.* New laws should be drafted quickly to deal with all aspects of bioresources and policy governing their use. These laws are to be drafted primarily in the context of two international treaties, the Convention on Biological Diversity (CBD) signed in Rio in 1992 and the GATT/TRIPs which was

finalised in 1994 and led to the formation of its successor the World Trade Organisation (WTO).

Three new laws have to be formulated for the CBD. These are (i) to establish ownership rights over the biological resources found in the sovereign territory of India. This is necessary to overturn the earlier principle of Common Heritage of Mankind according to which all genetic resources were considered to be the property of everybody, with no particular ownership. (ii) To formulate the guidelines and structures for Prior Informed Consent according to which user parties will have to seek the permission of some kind of National Authority authorised to grant or refuse access to genetic resources. Representatives of communities that have been responsible for maintaining genetic resources over generations and are the repositories of indigenous knowledge, should be members of such a National Authority. (iii) The conditions for Material and Information Transfer Agreements will have to be laid down so that the use of biological resources is just, equitable and sustainable. This law would seek to ensure that indigenous communities are not denied their share of the profits that accrue from the commercial exploitation of the genetic resources that they have conserved.

The question of Intellectual Property Rights will have to be addressed in the CBD, although indirectly. Our position should be that India will not grant IPR protection over products and processes derived from indigenous knowledge. The rationale for this is that knowledge that belongs to communities should not be privatised. Whereas this knowledge can and should be used for commercial exploitation and the betterment of communities, it should not be monopolised.

With respect to GATT/TRIPs or now WTO/TRIPs, a *sui generis* legislation will have to be brought in to determine the use of genetic resources in the breeding of new crop varieties and the kind of Intellectual Property Rights that would be granted for the development of new varieties. It would be highly inadvisable in this case to follow the UPOV model for Plant Breeders Rights, as favoured by the government. The UPOV model is relevant for industrial economies where it was developed, not for agricultural economies like ours. UPOV respects the rights of breeders but has no mention of the rights of farmers who are the creator/maintainers of the agricultural stock and land races without which modern breeders could not breed new varieties. Our *sui generis* legislation should place Farmers Rights on par with Breeders Rights and acknowledge and reward the contribution of farm men and women to the development of land races and therefore to the development of new varieties. The indigenous knowledge involved in the location of favourable genes needed for successful breeding work should be paid for. The recipient can be the *Community Gene/Technology Fund* mentioned earlier.

Another prospective legislation emanating from the WTO/TRIPs will have to decide on an IPR regime for micro organisms. Micro organisms do not feature as much in the mainstream of community knowledge as plants and animals. Even then, there are pockets of specialised knowledge regarding

their use in cases like human and veterinary care and the processing and preservation of many foods. Care will have to be taken that any IPR regime that India accepts, will have provisions for acknowledging and compensating the rights accruing from indigenous knowledge.

COUNTERING MULTILATERAL INVESTMENT TREATY

To maintain reciprocity with the proposed Multilateral Investment Treaty originating from north, the poor countries as a group can propose a Multilateral Labour Treaty for accessing different sectors of global labour markets. Such a treaty can be proposed in the ministerial meet of WTO at Singapore in December or taken up in future rounds of WTO negotiations. The Multilateral Labour Treaty would basically counter the Multilateral Investment Treaty of OECD countries and, at this juncture, act as a major bargaining tool for the poor countries.

Many poor countries with surplus labour have comparative advantage in exporting labour services. This contributes to export earnings from labour services by way of wage-income, fee, honorarium and other remittances. Such exports of labour services help many poor countries often to finance their international payments imbalances, to hedge against falling export earnings, to increase savings and employment opportunities and alleviate poverty. They have the advantage in not only using cheap labour as a factor of production but also in relocating them through temporary international migration for trading in labour services. At the micro level this helps in achieving decent standards of living for many migrants from poor countries.

In WTO only those countries which have stocks of higher level personnel are in a position to take such advantage of GATS commitments. However, most of such advantage would be exploited by multinational firms of the industrialised countries which tend to dominate this category of superior personnel. The poor countries have nothing much to gain from the kind of commitments made since normally such countries do not specialise in export of higher level personnel. Most of them import such personnel rather than export them. Hence with reference to this mode of delivery, GATS commitments have virtually scaled the fate of the poor countries.

TRADE IN LABOUR SERVICES: REAL WORLD SCENARIO

In today's world, however, the GATS commitments do not reflect the existing reality. On the contrary, we find that there is a flourishing global trade in labour services where developing countries actively participate as per the *World Development Report* of 1995 of the World Bank. According to the World Bank estimate, some two to three million new migrants now leave developing countries each year (both legally and illegally), about half of whom go to the industrialised countries. Between 1970 and 1992, low and middle income countries' share of world work-force rose from 79 per cent to 83 per cent and their share of world's skilled work-force (those workers with at least a secondary education) jumped from

Multilateral Investment Agreement and Poor Countries

Neela Mukherjee

While the OECD countries have proposed the Multilateral Agreement on Investment, the opportunities open to the poor countries for exporting labour services have been crippled by the GATT-Uruguay Round. The developing countries as a group must focus on this asymmetry at next month's WTO Ministerial Conference and in subsequent rounds of WTO negotiations.

THE WTO Ministerial Conference to be held at Singapore from December 9 to 13 is slated to be a crucial one from the point of view of assessing the implementation of the GATT-Uruguay Round and also tackling new issues in the geopolitical agenda of global economic integration. The major challenges facing WTO emanate not only from the implementation of the GATT-Uruguay Round's results but also from the 'new agenda' covering trade and investment, competition policy, trade, environment and social standards. There is yet another issue which is fast brewing. Upcoming at the WTO Ministerial Conference at Singapore is a proposal made by the European Commission in a paper entitled 'A Level Playing Field for Direct Investment World-Wide' for negotiations on a multilateral agreement on investments. This is to endorse, without discrimination, "the international rules on foreign direct investment which should guarantee generally free entry and establishment for foreign investors, full national treatment for established investments and high standards for investment protection".

LABOUR MOVEMENTS RESTRICTED BY GATS

If we examine the proposed Multilateral Agreement on Investment (MAI) of OECD against opportunities of poor countries for exporting labour services (capital and labour being two parallel factors of production where comparative advantage of the north lies in capital flows while that of the south in flow of labour services) we find that the GATT-Uruguay Round has crippled the gains of developing countries from exporting such services. It is crystal-clear from the results of the Round, that at least on one account, i.e. for accessing markets for exporting labour services, the poor countries have registered

substantial losses while negotiating under the General Agreement on Trade in Services (GATS). Their comparative advantage in exporting labour services has been drastically curtailed by the nature of specific commitments under GATS.

Labour movement has been severely restricted although the importance of 'labour' has been recognised and its movement included in GATS as a mode of delivery of services in addition to the other three modes, namely, (i) cross-border supply, (ii) consumption abroad (movement of consumers from importing country to buy goods and services in host country), and (iii) commercial presence or setting up of establishment by host country enterprises in the importing country. Market access commitments of member countries under GATS clearly reveal that the subject of movement of labour other than higher level personnel has been carefully kept outside the purview of GATS in WTO. While most countries have restricted movement of personnel exclusively to higher levels, very few countries have included 'other personnel' in their commitments and a few others have not made any explicit statement in this regard. Majority commitments in market access in general have allowed exclusive entry of higher level personnel in professional, managerial and technical category. This reflects current trends in liberalisation and globalisation of production and also prompts a global search for expertise and creates pressures for liberalisation of regulations involving temporary movement of highly skilled persons, as pointed out by a recent UNCTAD report. In such a process, those categories of natural persons lacking higher levels of skills and knowledge get marginalised from such globalisation and liberalisation of labour markets.

a third to nearly a half. The demand for labour services is increasing at a fast pace in different parts of the world, including migration within Asia which is picking up. Hence, there are different sectors of movement of migrant labour, including personnel, taking place outside the orbit of WTO although just one sector of superior personnel has been formally recognised by WTO. It is clear that the specific commitments of GATS regulate only a small part of movement of labour leaving the rest of labour exports to trade relationships outside WTO. Operating formally in such a narrow sector creates a rift in WTO's objective of establishing a multilateral framework of principles and rules for governing trade in services, especially those for liberalising labour markets.

The poor countries have not only registered potential (actual with implementation) losses in multilateral trade under WTO as a result of restrictions imposed on movement of labour through GATS, they are also heading towards the highly skewed multilateral investment treaty which attempts at protecting the investment interests of the rich multinationals of the north. The would-be treaty proposes to bypass a host country's economic, strategic and security interests. It proposes to create suitable market conditions for foreign investment and desires extensive changes in the policy framework of host countries covering taxation laws, labour laws, anti-trust laws, company by-laws without any consideration for national objectives, security concerns, geo-political interests, stage of development, balance of payments position, etc.

Of late, enforcement of WTO rules and regulations regarding multilateral trade and investment almost infringes the sovereign rights of a nation state. With WTO overseeing the implementation of the GATT-Uruguay Round, the ambit of sovereign policy-making for the member countries is considerably curtailed in the spheres of agriculture, industry, services, intellectual property rights, investments, subsidies, standards, etc. One agrees that it does make sense for countries to make small sacrifices if the real cause is promotion of free and fair multilateral trade. However, north's attempts at imposing protectionist measures in the garb of social and environmental clauses and labour standards affect the credibility of WTO's objective of promoting multilateral trading and its progressive liberalisation. Again unilateral moves from countries of the north regarding trade and investment raise questions of sovereignty, national security, rights of jurisdiction and independent pursuit of economic policy options in the south and its reciprocal treatment.

OPTIONS OPEN FOR DEVELOPING COUNTRIES

As per the current mandate of WTO, the poor countries would be either forced to stop trading in labour services sooner or later or, alternatively, would have to search for such

trading opportunities outside the WTO route. The latter indirectly weakens and threatens the very functioning and objectives of WTO as a multilateral institution. One option is to establish/strengthen bilateral or regional trading relationships with countries where the movement of labour as a mode of delivery of services can be exploited. This includes both WTO members and non-members since all countries are not members of WTO. For example, Bangladesh, Sri Lanka, India, Pakistan, etc., have entered into bilateral arrangements with many Asian countries for exporting their skilled and semi-skilled labour services.

In the years to come, when implementation of GATS catches up, exporting labour services to existing global markets, both inside and outside the WTO system, might get to be more arbitrary, exploitative, restrictive and less transparent. However, such markets are expected to increase in size with greater demand for both skilled and semi-skilled labour from both industrialised and poor countries. Hence, those poor countries, with comparative advantage in export of labour services can seize such opportunity and evolve ways, multilateral, bilateral and regional, to have better terms of negotiations in labour services which can create future avenues for increased export of such services. One attempt at multilateral trading is to propose a multilateral labour treaty. Even when such a proposed treaty is not accepted and translated into actual practice it can help in countering the multilateral investment treaty and strengthen south's bargaining position.

PROPOSED MULTILATERAL LABOUR TREATY

Uninterrupted labour flows across the globe would lead to the greatest benefit to the world economy when such flows can take place with minimum of barriers and in a transparent and predictable system. For the proposed Multilateral Labour Treaty, the following points can be considered to formalise such labour flows:

- * making space for reasonable market access to labour of all categories as service providers;
- * offering national treatment for labour and their services;
- * undertaking a set of guarantees for service providers by the importing countries; and
- * setting up a mechanism to monitor and enforce commitments.

Commitments can be made for the categories of ILO occupations such as professional, technical and related workers, administrative and managerial workers, clerical and related workers, sales workers, service workers, workers in agriculture, animal husbandry, forestry, etc., production and related workers, transport equipment operators and labourers. The member countries of WTO can also offer sectoral and subsectoral commitments with respect to the above categories of workers.

All restrictions and barriers such as labour market test, economic needs test, etc., imposed

by importing member countries need to be transparent. Appropriate safeguards such as quota and other reasonable quantitative restrictions can also be employed, if found necessary.

Such guarantees are to be provided by importing countries against exploitation of migrant labour, discriminatory treatment etc. Labour service providers must have freedom to move and a right to dignified existence backed up by legal guarantees. The advantages of cheap labour should not face trade barriers such as equal remuneration, labour standards, technical requirements and local commercial presence. These guarantees are also required. Another requirement may be that of a 'social clause' to do away with forced labour, child labour and exploitation of women labour. This can also be added to the treaty in a predictable manner. Such a treaty needs to include issues in illegal migration, respectable conditions of employment, flexible laws on workers' remittances, appropriate changes in labour laws, taxation laws, flexible work permits, employment benefits and protection of foreign workers from physical attacks and mental torture by vested interests. A monitoring mechanism may be set up to enforce the guarantees and to oversee the implementation of the treaty. Amicable procedure for settlement of disputes also needs to be included in the treaty.

Such a treaty, if accepted, can play an effective role in increasing participation of poor countries, ease their payments situation through remittances, create flexibility in pursuing liberalisation measures and broaden their domestic markets. It would also lead to liberalisation of global labour markets, ease labour shortages in global markets, improve labour standards, upgrade skills through international exposure, expand markets, improve purchasing power and alleviate poverty.

Based on current trends in global demand for labour and professional services, gains to poor countries from accessing foreign labour markets through WTO can be considerable both at micro and macro level. A treaty such as the one proposed here would help in liberalisation of labour services as a part of the multilateral trading system where dispute settlement machinery of WTO can be accessed for settling disputes. It would help the poor countries to reduce present arbitrariness and uncertainties regarding export of labour services. It would also provide them with opportunities to increase their gains by participating in the multilateral trading system and augment their export earnings, income, employment and reduce poverty. Last, but not the least, such a labour treaty, if proposed would help to counter the proposed multilateral investment agreement, a major unilateral move from the countries of the north.

[The views expressed here are in the personal capacity of the author.]

T N Krishnan

In Memoriam

A Vaidyanathan
N Krishnaji

T N Krishnan, whose research interests encompassed food policy, literacy, health, fertility behaviour and social security, was of the firm view that research should not end up in the annals of academia but must be used to change and improve policy.

T N KRISHNAN, who passed away in Thiruvananthapuram on September 7, was a person of extraordinary accomplishments. His primary vocation was teaching and research in economics. But he was unconventional both in the choice of research areas and in the way he approached them. His earliest work, exploring agriculture-industry relations, using a formal model and econometric estimation, already showed signs of his originality and insights. Over the years his interests became wider and encompassed literacy, health, fertility behaviour and social security, all of which have a direct bearing on the living conditions of the poor, disadvantaged population. He was quick to see that one needs to go beyond the domain and tools of conventional economics to a consideration of social and political forces operating in a historical context.

This is not the occasion to attempt a comprehensive account of Krishnan's research. But it is appropriate to highlight some of his major contributions. The line of argument on agriculture-industry relations developed in his PhD thesis was stated and restated later by many others in the exploration of demand constraints on the industrial development of India. Krishnan saw food production and consumption as holding the key to India's economic prospects. He continued work on this theme during his tenure on the faculty of the Indian Institute of Management, Calcutta, by looking at several specific food policies including the impact of foodgrain prices and imports under PL 480 on domestic production and surpluses. Food policy remained a theme of life-long concern for him, as did his interest in policy questions.

Throughout he was of the firm view that research should not merely end up in the annals of academia but be used to change and improve policy. His approach in this respect was always positive in seeking what is feasible under given political and other constraints. He made it a point to actively interact with politicians and bureaucrats in a position to shape policy and made a conscious effort to keep in touch with them and persuade them about policies which he felt were necessary.

His move to the United Nations during the mid-1960s prevented him from fully

developing his ideas on the relationship between food and industrial development. However, he came back repeatedly in his later work to the food economy, but from an altogether different point of view, namely, ensuring adequate supply of food at reasonable prices to the large mass of people living in poverty.

Krishnan had deep emotional roots in Kerala and was attached to the state, without being in the least parochial. Shifting from IIM to teach in Kerala University was like home-coming for him. He was also part of the group which founded the Centre for Development Studies. In 1974 he formally joined the CDS faculty and, except for an absence of a few years in the UN forced by the serious illness of his young wife, he remained active in the Centre for the rest of his life. He served as its director for some years. Throughout he was deeply committed to building the CDS and worked with great zeal and energy to help make it a leading national centre for research and postgraduate teaching.

In terms of research, explaining Kerala's achievement in literacy, health status, fertility decline and public distribution of essential goods, despite a low level of development as conventionally measured and high unemployment rates, was the source of sustained intellectual stimulus for him throughout the last 25 years. During the early 1970s he was among the first scholars to have noticed and clearly formulated the nature of the Kerala puzzle – rapid social advancement in many respects combined with poor economic performance. His pioneering work on the demographic transition in Kerala was an effort to understand one important aspect of the puzzle. The prescience of this study lies in its analysis of inter-regional variations and focusing on the events during the last two decades that led to a narrowing of the gap in demographic variations between the northern and southern parts of Kerala. It shows the depth of Krishnan's understanding of Kerala.

His interest in population-development relations became stronger during his tenure at the UNFPA in the early 1980s. Soon after his return, he took the initiative to establish, under UNFPA auspices, an international

centre for training in population and development. He was not daunted by the considerable scepticism and some opposition in the CDS community at that time to the idea. That the centre has been functioning for over 10 years and has earned a well deserved reputation is a lasting tribute to Krishnan's perseverance and efforts.

Simultaneously he pursued and encouraged work on factors accounting for Kerala's achievement in universalising elementary education and in reducing mortality rates; the significance of the relatively high rates of morbidity in the state; and the conjunction of high unemployment rates and high wage rates. All this work was leading him to the view that the Kerala model is a unique product of its own history. In this light, he began to study the history of social development in Kerala and reformulate his ideas on the types of public action necessary to promote rapid change in fields like education and health. Much of his writings in this respect still remain unpublished.

Krishnan was throughout keenly interested in and kept track of similar work on other parts of the country. Being deeply convinced about the importance of literacy, public health and a modicum of social security for mitigating poverty, he came to share a widely felt concern that 'structural adjustment' policies initiated in 1991, emphasising reduced fiscal deficit as an imperative goal, might lead to cuts in public outlays on these programmes. He not only played a key role in preparing a major research project on Human Resource Development under the auspices of the government of India and funded by the UNDP, but enthusiastically took the responsibility for managing it.

The programme has broken new ground in the organisation of social science research in several respects. It brought together a wide cross-section of interested scholars from different backgrounds to discuss and hammer out a research agenda. It devised ways by which a number of researchers from different parts of the country could work in a collaborative and interactive manner.

The results of this project have been pouring in. Krishnan was full of plans for putting them together in a series of publications and for organising workshops to bring the findings and their policy implications to the notice of leading public and political figures and civil servants. His sudden passing is made the more poignant because it occurred just when his last major undertaking was bearing fruit. The messages sent by the participants in this project on hearing of his demise are a moving testimony to their affection and regard for Krishnan. Like them, his numerous other friends and associates will miss his warm and caring presence, his infectious enthusiasm and dedication to work.

Gandhi in the 21st Century

Search for an Alternative Development Model

Vasant Kumar Bawa

Gandhi's espousal of ecologically sustainable and employment-oriented development is all the more significant today as fossil fuel-driven industrialisation and insatiable consumerism engender crisis in resources on a global scale.

THE Centre for Cellular and Molecular Biology (CCMB) one of the 'temples of modern India' inspired by Jawaharlal Nehru's concern for the promotion of the scientific temper in India, was the scene of a two-day seminar in which serving and retired technocrats, scientists, bureaucrats, and others concerned with the future of the Indian polity, economy and society discussed the prospects of adapting the ideas of Mahatma Gandhi in order to tackle some of the major problems facing the country today, at the instance of the Shanthi Foundation, Hyderabad. India does not fall in the mould of the highly industrialised countries, and hence the attempt to imitate the economic model of these countries is likely to fail. Even the export-led growth of the Asian tigers cannot be adopted by India, many participants felt, because of the massive problems of unemployment, and the population explosion which continues unabated today. The director of the CCMB, D Balasubramaniam, made a perceptive remark at the inaugural session that Gandhi had much to say on technology, but little on science. (Perhaps he could have added that Nehru had had a lot to say on science, but had not applied his mind adequately to the adverse consequences of technology, as Gandhi had).

Ever since the publication of *Limits to Growth: A Report for the Club of Rome's Project on the Predicament of Mankind* (New York, 1972), the world has been haunted by the spectre of environmental disaster and the depletion of natural resources. The very next year E F Schumacher published his collection of essays, *Small is Beautiful: A Study of Economics as if People Mattered* (Vintage Books, London). These two works have had a substantial effect on the subconscious of all thinking people, although the day-to-day pressures of politics and economic growth may have given greater importance to the work of scholars like Herman Kahn, who co-authored a book *The Next Two Hundred Years*, published in 1976. Many of us now feel that industrialisation based on insatiable consumerism as an indicator of growth and quality of life has become a threat to the world's environment. It contributes greatly to the continuance of the greenhouse effect, global warming and the depletion of the ozone layer. The obsession with the acquisition of wealth has led to the global

trade in armaments and narcotics, and is destroying the natural habitat of the lion, the tiger, and other wild animals. This is endangering not only world peace, but the survival of mankind, and of the earth itself.

It is a remarkable tribute to the perspicacity of M K Gandhi, a young, inexperienced lawyer from Porbander in Gujarat, working in South Africa before the first world war, that in *Hind Swaraj*, his major critique of western civilisation as it had then developed, he had expressed the view that the western way of life would not be sustainable. He came to this conclusion after a study of western anti-industrial writers like Thoreau, Ruskin, and Tolstoy. Gandhi corresponded with the latter, and set up the Phoenix Ashram and Tolstoy Farm in South Africa, based on the ideas that he had then developed. In his recent book, *Mahatma Gandhi: An Apostle of Applied Human Ecology*, (Tata Energy Research Institute, New Delhi, 1996), T N Khoshoo, who was the first secretary of the Indian ministry of environment, quotes N Radhakrishnan who pointed out that Gandhi had successfully demonstrated that "each member of this community could live in harmony with nature. The community life Gandhi was developing consisted of manual labour, tree planting, agriculture, simple life, and crafts". These could not be described as 'utopian ideals', Radhakrishnan continued. "The running and recurrent principle of the community life was to live according to the rhythm of nature and in harmony with what nature offers" (p 10). It was because of his experience of dealing with environmental and development issues that Gandhi, when asked if he would like to have the same standard of living for India's teeming millions as was prevalent in England, remarked, "It took Britain half the resources of the planet to achieve this prosperity. How many planets will India require?" At another time, he remarked, "The earth provides enough for every man's needs but not for every man's greed" (pp 6-7). This concern is entirely in line with that of the world's environmentalists and others in the modern world who organised the Rio summit on environment and development in 1992, and who are carrying on a vigorous debate on the question today.

During the first 10 years after his return to India in 1918, Gandhi was preoccupied

largely with political issues and the freedom movement, including the Rowlatt act, satyagraha, the Jallianwalla Bagh massacre, and the Khilafat movement and its aftermath. But in 1928 he invited the western-trained chartered accountant and economist, J C Kumarappa, to the Sabarmati Ashram in Ahmedabad. Almost immediately, Kumarappa decided to give up his westernised lifestyle and to become a full-time Gandhian economic analyst and social worker. He founded the Khadi and Village Industries Association, which after independence was converted into the Khadi and Village Industries Commission, with its headquarters in Mumbai. T Krishnamurthy of the J C Kumarappa Memorial Trust, Bangalore, described the conceptual framework of J C Kumarappa and his early work in a paper entitled 'The Economics of Peace'.

M Ramakrishnayya, former deputy governor of the Reserve Bank of India, spoke about the enquiry he had conducted into the work of the Khadi and Village Industries Commission in 1985. He felt the old Gandhians had prevented the adoption of innovations for a long time. Khadi had received a boost during the 1960s, but there was a decline from the mid-1960s till 1978. It was pointed out during the discussion that after the Ramakrishnayya report, a high power committee headed by P V Narasimha Rao had introduced new subsidies for silk, khadi, woollens, cotton and polyvastra. Amount of Rs 10,000 crore has been allotted and production is to be doubled by the end of the Eighth Plan. This shows that, in spite of globalisation, some in the Congress Party are aware of the employment potential of khadi and village industries. Whether the amounts allotted are being wisely spent, however, requires critical analysis. The dialogue on the relevance of Gandhi in the new dispensation must therefore continue.

D K Oza, formerly of the Tamil Nadu government, has devoted himself to the Gandhian movement in recent years. He pointed out the continued relevance of the constructive programme drafted by Gandhi in 1940, and suggested minor changes to it. He pleaded for the re-publication of the writings of Gandhi with new introductions, pointing out that the rural areas were almost in the same state of backwardness they were in under the British rule. He also wanted steps to be taken for a dialogue of Gandhians with Marxists, who could work together to oppose religious bigotry, the intrusion of multinationals, and the criminal nexus among certain groups who run India today.

The CPI leader, K L Mahindra, accepted the suggestion for a dialogue, pointing out that both Marx and Gandhi wanted people's welfare, although their ideologies were different. He stated that Gandhi had not opposed the armed struggle in Telengana (in which Mahindra was an active participant), although he did not support it either. Mahindra

felt that today, except for 25 crores of people in India, the rest are outside the global market. Thus, there is great scope for Marxists and Gandhians to work together to provide employment to the rural people, oppose corruption and women's exploitation. Gandhi was clearly opposed to consumerism, as he wanted ministers to get a salary of Rs 500 per month, and peons Rs 50 per month. Mahindra felt that a proper mix of handicrafts, agriculture and technology is called for in the present context. We have to strive for self-reliance, as distinct from self-sufficiency, which is not possible, he argued.

The ideological and social framework of the Gandhian ideology in the present context was explained by D Gopalaswamy of the Gandhi Centre, Visakhapatnam, and the Gandhian social worker and reformer, Lavanam, whose father, Gora, had been close to Gandhi. An economist, Prabha Panth of Osmania University, spoke about the religious, ecological and economic aspects of the crisis of modern humanism. She suggested that the ecological and long-term impact of different forms of production and consumption should be reflected in the tax and subsidy policies of governments. For instance, bicycles and cycle-rickshaws could be subsidised, while taxing fossil-fuel driven vehicles. Secondly, research should be directed on eco-friendly lines. A switch in the technology base has to take place from fossil fuels to solar energy, from synthetics to cotton and biodegradable fabrics, and from inorganic to organic fertilisers. Moreover, "eco-friendly entrepreneurship, ecological management and ecological research must be integrated at the post-secondary stage, in order to supply the human inputs for the above measures".

While Gandhian ideology faces the challenge of globalisation, the seminar participants were able to point out some of the lessons of the Nehru era, when some Gandhian institutions were adapted to the post-independence scenario. H W Butt, who had headed the Extension Education Institute of the ministry of agriculture at Nilokheri from 1959 to 1970 for training the faculty of agricultural universities, home science colleges, principals of gram sevak training centres and the like, spoke about the village work initiated by Gandhi and some of the reasons why it did not fulfil its objectives in the post-independence period. During discussion, a brief reference was made to the Bhoodan movement of Vinoba Bhave, which spread from Telengana all over India, and received official patronage, but suffered from major organisational defects. The concept of trusteeship also came in for discussion, and is likely to form the subject of a later seminar of the Shanhi Foundation.

In the early 1960s, Jayaprakash Narayan invited to India the British economist, Schumacher, whose early essay, 'Buddhist Economics' had praised the Burmese for limiting their wants. Schumacher's visits to India gave an impetus to efforts already

under way in the Planning Research and Action Institute, Lucknow, when Sucheta Kripalani was chief minister of Uttar Pradesh. A former director of the PRAI, Anand Sarup, could not attend the seminar, but sent his paper which was presented by the present writer. It highlighted the crucial role played by M K Garg of the PRAI, who pioneered many viable small-scale technologies, such as the pit method of leather tanning, standardised gobar gas plants, white-ware pottery, crystalline sugar, and small-scale cement plants. It is important that these products, as well as many newer ones like solar cookers, should be re-examined, revived and absorbed into the commercial market stream of small industry today, instead of surviving as isolated pockets in government institutes. Subsidies may be required initially, but ultimately the product must sell on its own merits in the market economy.

Anil K Rajvanshi of the Nimbkar Agricultural Research Institute, Phaltan, Maharashtra, presented an important paper on a decentralised energy model, which he has practised for several years in Phaltan. He compared sustainability with a chair, which must have four legs, viz, energy-related, economic, environmental, and socio-cultural aspects. His article, 'Energy Self-Sufficient Talukas, a Solution to National Energy Crisis', was published in the *EPW*, (December 23, 1995). R Rajamani, former secretary to the environment ministry of the government of India, presented an original proposal on eco-tourism, which he proposes to develop at future meetings of the Shanhi Foundation. A S Rao, founder-managing director of ECIL, urged a "determined pursuit of self-reliance in development", and pointed out that 'doles' like two-rupee rice cannot replace the concept of full employment. Arif Waqif, an economist who has helped to promote SAARC through several technical-support institutions, pointed out that the new economic trends in the west

were not leading to an equitable society. There was talk of the 'new poor' in the west today. Spain had doubled its GDP in 10 years from 1982, without creating a single additional job.

The final statement of the seminar, which was developed from a draft by P V Shenoi, director, Institute of Social and Economic Change, Bangalore, expressed the view of the participants that the principles on which Gandhi built his political and social thought were: (i) peace and non-violence, (ii) universal brotherhood and harmony from the individual and the family to the country and the world, (iii) working towards a society that is not exploitative of nature and human beings, (iv) rationality, and adaptability to change in conditions, and (v) simple living and high thinking. The following means were recommended for adoption to fulfil the above Gandhian principles, which those present fully accepted: (1) social reforms, women's education and empowerment; (2) a balance between industrial and agricultural activities and rural and urban development; (3) trusteeship for managing of natural and productive resources; (4) adoption of such technologies as are employment-friendly, eco-friendly and market-friendly; (5) opposing unbridled exploitation of natural and productive resources which promotes consumerism; and (6) adoption of an energy strategy that is decentralised, ecologically viable and non-exploitative.

The dialogue among the participants is to be continued in Hyderabad, and generally in southern and western India, from where most of the participants came. The next meeting will probably be in Bangalore in October, where it is hoped that access to the work of field institutions like ASTRA of the Indian Institute of Science, and the J C Kumarappa Memorial Trust will be available. It is proposed to publish the proceedings of these seminars in summary form.

This book is an attempt to analyse the necessity of separate hill state for Uttarakhand for which a mass movement is going on in the eight hill districts of U.P. since 1994.

Ethnicity, Class and State in Pakistan

Feroz Ahmed

The current ethnic tensions in Pakistan are rooted in a number of developments: the increasing ethnic heterogeneity of the country's provinces, the growing economic and political interdependence, and the ongoing processes of cultural homogenisation as well as the rapid urbanisation, and the sharpening ethnic asymmetries within Pakistan's elite. These very developments, however, offer the opportunity for seeking solutions in a multi-ethnic framework.

IN the era of globalisation of technology, capital, markets, and communications, a centrifugal phenomenon described by Isaacs more than 20 years ago as 'massive retribalisation' of the world, is proceeding on an ever wider scale [Isaacs 1975]. Ethnic, religious, and caste conflicts are tearing apart not only the former Soviet republics and eastern Europe, but many third world countries too. Pakistan, is one such country which is witnessing one of the most serious ethnic conflicts of its history. In 1995 alone, more than 1,700 persons, including more than 200 law enforcement personnel, were killed in its major city, Karachi (Yasser Hossain, 'Whodunnit?' in *Newsline*, November 1995). A militant ethnic party, the Mohajir Quomi Movement (MQM), is in violent confrontation with the government. Ethnic polarisation in the province of Sindh is almost complete and in Balochistan it has shattered the traditional fraternity between ethnic groups.

CONCEPT OF NATIONALITY

The term 'nationality' has been in common use in Pakistan to denote ethno-linguistic communities. It has been in the vocabulary of the nationalists and Marxists and now even right-wing - politicians from different provinces, as well as Marxist and nationalist scholars. The problems of language, culture, regional autonomy, allocation of resources between ethnic communities, and political participation have been subsumed under the rubric of 'national question' or 'nationality question' [see Ahmed 1972; Zaidi 1992].

Stalin defined nation as a "historically evolved, stable community of language, territory, economic life, and psychological make-up, manifested in a community of culture". All of the foregoing characteristics must be present in a community to qualify as a nation. Stalin's definition precluded race, and emphasised emergence of nations as a phenomenon of bourgeois development. Neither Stalin nor Lenin, who empha-

sised national self-determination and formulated an elaborate nationality policy, made any effort to distinguish between nation and nationality.

However, later day Soviet scholars have tried to differentiate between nation and nationality by positing the nationality theory on the bedrock of the Marxist theory of historical materialism. Thus, the various stages in the development of productive forces were linked with corresponding types of ethnic communities and their levels of ethnic consciousness. Significantly, Gankovsky (1964) adds the subjective criteria of spiritual culture and ethnic consciousness to the objective criteria required of a nationality. A distinction is, therefore, made between the 'nationalities' of the slave-owning and feudal societies and bourgeois 'nations' of capitalist and socialist stages. Gankovsky recognised that Bengalis, Punjabis, Sindhis, Pushtoons, and Balochs had all developed as feudal nationalities by the time of the British conquest. Since the Soviet constitution, while categorising the major ethno-linguistic groups as nationalities and organising the territory on nationality-based republics, recognised in theory their right to self-determination, the right was, therefore, supposed by third world adherents of the Soviet nationality theory to be an inherent right of any ethnic community in a multi-ethnic state that met the criteria of Stalin's definition of a nation, and thus of nationality.

In Pakistan's context, the Marxist definition of nationality became the cornerstone of the nationality position of the multi-ethnic National Awami Party (NAP) and other leftist and regional nationalist formations. Among the political leaders, cadres, and intelligentsia of the dominated nationalities, as well as among Punjabi and Urdu-speaking leftists, it became axiomatic that Punjabi and Urdu-speaking groups dominated the state, while Bengalis, Sindhis, Pushtoons, and Balochs were the oppressed nationalities.

For the governments of Pakistan, the word nationality has remained anathema to national

integrity and evoked strong reaction. The government passed a law in 1975 prescribing a seven-year imprisonment for individuals advocating the presence of more than one nationality in Pakistan. At least part of this fear can be attributed to the failure of the nationality theory to distinguish between the characteristics of a nation and a nationality, while advocating the principle of nations' right to self-determination. Lenin himself had emphasised ad infinitum nations' right to self-determination, without clearly distinguishing them from nationalities.

In Pakistan itself, not only did Bangladesh secede, but demands for the independence of Pushtoonistan, Sindh, and Balochistan were raised from time to time. These actions were justified by some in the name of the Leninist theory of the right of nations to self-determination. The Marxist concept of nationality in Pakistan, beside presenting the problem of being perceived as an antithesis of the goal of national integration, has been found to be less than adequate to address some concrete issues of group identification.

First, the Marxist definition of nation - and thus nationality, in its simplest form, equates one language with one nationality. Therefore, the question has often been raised: how could the speakers of Balochi, an Indo-Iranian language, and Brauhi, a Dravidian language, be members of the same Baloch nationality? This, obviously, is a somewhat minor problem, emanating from overlooking the dynamic nature of ethnogenesis and subjective aspects of nationality. People speaking Brauhi at home in Balochistan are integrated in every respect, including clan organisation, with those speaking Balochi alone, and have considered themselves nothing but Baloch.

Second, for nearly two decades there has been a movement for the recognition of Siraiki language and nationality in Punjab. The 1981 census, for the first time ever, listed Siraiki as a separate language rather than as a dialect of Punjabi. As a result, Siraiki was reported to be the language of 9.8 per cent of Pakistan's and 14.9 per cent of Punjab's households [Government of Pakistan 1983]. This makes the Siraikis the fourth largest community after Punjabis, Pushtoons, and Sindhis. However, questions still persist about the stability, territorial compactness, economic cohesion, and consciousness aspects of Siraiki-speaking people. The objective and subjective criteria on the basis of which other communities in Pakistan have been recognised as nationalities are not easy to satisfy in the case of Siraikis. However, it may be possible to address the questions of group identification, and cultural, economic, and political

demands in an alternative conceptual framework.

A third issue of group identification which has illuded the Marxist concept of nationality and the approach based on it to address the problems of ethnic communities is the question of Mohajir identity and group demands. Mohajir is the term which was used by Muslims who migrated from India to Pakistan at the time of the partition of 1947-70 percent of these refugees in (west) Pakistan were Punjabis who settled mainly in (west) Punjab, spoke the same language, assimilated to the indigenous population, and shunned the Mohajir identity. However, the Urdu-speaking refugees from different parts of India, who settled mostly in Sindh, have continued to maintain the Mohajir label for their group identification.

Even with this linguistic homogeneity, the Urdu-speaking people do not satisfy the definition of a nationality. While they constitute a community of language and share a common non-material culture and psychological make-up, they are not a stable community, historically evolved in the land in which they now live. They do not form a community of territory, for their large concentrations in the urban centres of Sindh are not only established in the territory of the historical nationality of the land (Sindhi), but they vie for space with other migrant groups, principally Punjabis and Pushtoons. Nearly one-third of the Urdu-speaking people are settled in Punjab where they are scattered far and wide. What these contraindicators of nationality features among Urdu-speaking people suggest is not that the Urdu-speaking people should have an unequal or even different status than other ethnic communities, but that the nationality framework is not adequate to deal with the issues of an ethnolinguistic community which is as large as 7 percent of the country's population (more than twice as many as Balochs) and one-fifth of Sindh's population.

Finally, the processes of economic development, economic integration, inter-province migration, international migration, urbanisation, political alliances and integration, and cultural assimilation, have brought about changes in Pakistan which make the linguistic, cultural, social, political, and economic problems of ethnic communities exceedingly difficult to be addressed in the iron framework of the highly objectified Marxist category of nationality.

ETHNIC GROUPS: AN ALTERNATIVE FRAMEWORK

Sociologists understand that social categories are not objective social facts but theoretical constructs or abstractions of

reality to categorise and analyse social and behavioural phenomena. Most constructed social categories have the problem of defining the boundaries, and all the individuals or elements cannot be neatly assigned to watertight compartments. Any alternative concepts that may be suggested would, therefore, have some problem in applicability. The important point is to see which of the alternative concepts is more inclusive for the purpose of analysis and, in the case of Pakistan's ethnic question, allows for a more equitable treatment of different groups. The alternative concept suggested here is ethnic group.

The *International Encyclopaedia of the Social Sciences* defines an ethnic group as a "distinct category of the population in a larger society whose culture is usually different from its own. The members of such a group are, or feel themselves, or are thought to be, bound together by common ties of race or nationality or culture". The encyclopaedia definition does not include territory as a criterion, and mentions culture generally without emphasising a special position of language. *Encyclopaedia Britannica* defines an ethnic group as follows: "a social group or category of the population that, in a larger society, is set apart and bound together by common ties of race, language, nationality, or culture". As a general case, at the core of ethnic identification are the "primordial affinities and attachments," derived from place of birth, kinship relationships, religion, language, and social practices that come "natural" to an individual to attach himself to other individuals from the same background [Geertz 1967]. Students of ethnic identity formation and change have noted that group identities change, new cultural or ethnic identities are created, and old ones disappear [Brass 1991; Horowitz 1975].

Brass (1991) defines an ethnic group on the basis of both objective attributes and subjective self-definition, and traces the stages in the ethnic community formation. Brass' definition of an ethnic category begins with the objective cultural markers of language, religion or race, diet, dress or customs, which are susceptible to change and variation. When a group uses these cultural symbols in order to create internal cohesion and differentiation from other groups, it becomes a subjectively self-conscious community. Ethnic identity also requires a claim to status and recognition either as a superior group or at least a group equal to other groups. In the next - but not inevitable - stage of development the elites of the self-conscious community articulate social, economic, and political rights of the group as a whole, and resort to political

mobilisation of the community. Brass (1991) terms ethnic communities of 'political significance' as nationalities.

The prevalent usage of the concept of ethnic group thus, does not include territory as a necessary condition. Freedom from such a binding condition makes the concept more inclusive. Further, common culture of the group is universally deemed to be a necessary condition for a group to be considered a distinct ethnic group. However, possession of a distinct language is not always a precondition. In applying the concept of ethnic group to the conditions of Pakistan, language would be the central defining feature of an ethnic group. Since all linguistic groups have more or less distinct cultures, in addition to many overarching cultural characteristics that they share in common, the criterion of culture would also be satisfied. So far as the subjective dimension is concerned, all the major groups are already characterised by the possession of ethnic self-consciousness, and would qualify as ethnic communities. Others possessing the objective attributes but not subjective self-consciousness would be accepted sooner or later by the larger society if they assert their identity and demand status as a distinct ethnic community.

With ethnic group or ethnic community defined broadly as above - not requiring the conditions of an historically-evolved, stable community of territory, there should be no problem in categorising the Urdu-speaking people of Pakistan as an ethnic community, on par with Punjabis, Sindhis, Pushtoons, Balochs, Siraikis and others. However, the leaders of the MQM, who demand the recognition of Mohajirs as a separate nationality (the 25-point 'Charter of Resolutions' (1988) included as the first demand: "Mohajirs be constitutionally declared a separate nationality in Pakistan". Reprinted in *The News* (Karachi) October 14, 1994) insist on a broader definition of Mohajir that includes not only the Urdu-speaking people, but also all other non-Punjabi groups whose members also migrated from India and settled in Sindh. Although recognition of Urdu-speaking people as a distinct ethnic community does not pose a theoretical problematic, extending such category to include ethnically diverse groups of self-identified Mohajirs may still be problematic.

ETHNICITY AND STATE

The state is both a resource in itself and a distributor of resources. In a multi-ethnic state, it is of importance to assess how these resources and state power itself are shared by the different ethnic groups, and whether state power is used differentially for the

different ethnic groups. The view of the state taken in this writing is informed largely by the work of Hamza Alavi (1966) who pioneered the analysis of the special role of military and bureaucracy in post-colonial societies by reference to Pakistan, and developed it into a theory about the nature of the state in post-colonial societies [Alavi 1982].

The Pakistani state can be seen as a neocolonial (peripheral!) state, linked as an appendage to the global capitalist economy and politically subservient to the major capitalist powers (metropolis!). The state, while perpetuating the existing relations of production and distribution, enjoys relative autonomy. The military and bureaucracy not only command the instruments of state power, but pursue their own interests almost independently of the dominant capitalist and landlord classes. Because of the special locus and role of the educated middle class in the society and vis-a-vis the state, the latter accords it a privilege, or at least a sensitivity, that is not extended to the workers, peasants and other subordinated classes. Further, as in many Latin American, Asian and African countries, the Pakistani military is more than an equal of the civil bureaucracy and has acquired the role of the ultimate arbiter of political power. Since the bourgeoisie and the landlord class are social classes and military and bureaucracy are wielders of the state apparatus, at one level of analysis it is important to keep the two separate. However, while analysing the class and power asymmetries in a multi-ethnic society, it becomes useful to treat both these types as elements of a common aggregation. Therefore, we shall refer to the landlord class, the capitalist class, military, and bureaucracy as various elements of the ruling class.

The different ethnic groups in Pakistan do not have an identical class composition. Nor do they have an equal, or even proportional, representation in the higher echelons of military and bureaucracy. Therefore, the various elements of Pakistan's ruling class have a disproportionate representation of the various ethnic groups in society. This situation represents a case, not of cross-cutting cleavages, but of overlapping of class and ethnicity to a large extent.

Demographically, the Punjabis comprise the largest single ethnic group (48.2 per cent) in Pakistan's population, followed by Pushtoons (13.1 per cent), Sindhis (11.8 per cent), Siraikis (9.8 per cent), Urdu-speaking (7.6 per cent), Baloch-Brauhis (4.2 per cent) and Hindko-speaking (2.4 per cent). No statistics by ethnic group are available for the civil service and military ranks. However, it is an accepted fact that the officers and

the rank and file of the armed forces are mainly Punjabi and Pushtoon, the former generally believed to be nearly 70 per cent and the latter 25 per cent to 30 per cent. The Urdu-speaking continue to be in the higher ranks of the military, but they are much less than their population proportion. There are no senior Sindhi or Baloch officers in the armed forces. Similarly, in the senior civil bureaucracy, the Punjabis and Pushtoons have a disproportionately high representation, the Urdu-speaking, a one-time dominant fraction, have slipped but still maintain a proportionately large presence, the Sindhis, despite some recent appointments to high positions, still are under-represented, and the Balochs, also under-represented, are too small a group to have any influence even if given a proportional share.

The ethnic composition of the dominant classes is also asymmetrical. The capitalist class of Pakistan consists mainly of Punjabis and members of the small business communities who have migrated from Gujarat and Mumbai and who have now begun to identify themselves as Mohajir. The Pushtoons are well represented in all strata of the capitalist class, having established their businesses in all four provinces. Traditionally, there have been only a few big Urdu-speaking capitalists, but an Urdu-speaking bourgeoisie is well-entrenched, owning medium and small businesses. There is no Sindhi bourgeoisie to speak of. Similarly, there is no Baloch capitalist class.

The landlord class, which continues to be of analytical and political interest, also has an uneven presence among different ethnic groups. The landlords with the largest estates and greatest political influence are to be found in lower Punjab (mainly Siraiki-

speaking) and Sindh. Feudal-type relations of production still persist in parts of NWFP and there are many powerful Pushtoon landlords. However, the more prominent of them also have business. Many of the traditional Baloch 'sardars' (tribal/clan chiefs), by usurping communal lands and privileges, have turned themselves into landlords, but most sardars are of modest means who depend upon government's largesse for their well-being. The Urdu-speaking community, being urban, has no landowning class.

Finally, the relative strength of the educated middle class, also varies greatly among the different ethnic groups. The Punjabis, both because of their population size and relatively extensive higher education, have the largest educated middle class in absolute numbers. However, the Urdu-speaking community, because of its urban background and traditional reliance on education for social mobility, has relatively the largest educated middle class. The middle class among Pushtoons and Sindhis is much less developed than among Punjabis and Urdu-speaking people, but is expanding rapidly. The Baloch middle class is still rudimentary, but gaining influence within its own ethnic group.

Several demographic, economic, social, political, and cultural trends in Pakistan are affecting: (a) the status of certain ethnic groups; (b) inter-ethnic group relations; (c) the relationship between state and ethnic groups; and (d) policy options pertaining to ethnic questions.

Large-scale inter-province migration, mainly from Punjab and NWFP, to Sindh, continued existence of more than a million Afghan refugees, and the presence of millions

of illegal immigrants have brought about a significant shift in the ethnic composition of Pakistan, especially, that of Sindh and Balochistan. Urbanisation, spurred by internal and international migration, often contains ethnic aspects. In Sindh, which was already 43 per cent urban in 1981, urban growth due to net migration, especially in Karachi, has largely been due to the 'non-indigenous' groups. This trend exacerbates the already existing urban-rural divide between Sindhis and non-Sindhis.

Regional and ethnic economic disparities created by Pakistan's pattern of economic development have been noted by scholars. Despite these negative trends, the overall thrust of economic growth and economic activities has continued to be integrative of the capital, markets and labour. Much debate and discussion have taken place in south Asia about the nature and consequences of development in the agrarian economy. However, it is quite clear that despite persistence of archaic instruments of production, old oppressive class relations, social power of the big landlords, and traditional values, the agrarian system inherited at independence and conveniently labelled as 'feudal' no longer exists. Capitalist development, with all its distortions and unevenness, has intruded into the agricultural sector of Pakistan's economy, not supplanting, but grafting itself on the old system. As a result of the technological changes, increased population density in the rural areas, and social changes facilitating alternative means of acquiring wealth and power, the traditional 'feudal' class is no longer tied to the land, and its younger members are seeking a share in the professions, capitalist sector of the economy, and state power, much the same way as other elements of the ruling class.

In a political system with numerous small and regionally-based political parties, the electoral process and the quest for power has required the building up of alliances across not only ideological lines but across regional and ethnic lines, both within and among provinces. This political deal-making has engendered interesting examples of ethnic and regional interdependence and mutual trust among parties.

Although Urdu is the mother tongue of only 7 per cent of Pakistan's population, historical circumstances have placed it in the position of being officially designated as the national language of Pakistan. Urdu has clearly established itself as Pakistan's principal language of education, mass communication, politics, business, and inter-province co-ordination. An increasing number of Pakistanis whose mother tongue is not Urdu are learning to speak and understand it. In the 1961 Census, twice as

many persons were reported to be speaking Urdu as persons whose mother tongue was Urdu. In 1981, 70.3 per cent of the 1,47,45,234 literate persons were literate only in Urdu. However, the impact of this assimilation is not uniform on different ethnic groups and in different regions.

Ethnic boundaries and ethnic identities in Pakistan are too fluid to be addressed by a framework requiring a highly objectified definition. If the purpose of public policy and political discourse is to secure justice and equality for all groups or even for one's own group, then the concepts which imply stratification by designating some as nationalities and others as merely linguistic communities would largely be counter-productive. Due to the increasing ethnic heterogeneity of Pakistan's provinces, the growing economic and political interdependence, and increasing cultural homogenisation, it has become imperative and even possible to seek solutions to the regional and ethnic problems in a multi-ethnic framework. For example, redrawing of provincial boundaries, which might have been possible in the early years of Pakistan, is no longer a viable, or even a problem-solving, option.

Although the process of urbanisation, particularly in Sindh and Balochistan, is taking place to the demographic and economic detriment of the local population, it would be a fallacy to view the urbanisation phenomenon as only an ethnic problem. However, in order to mitigate the divisive effects of urbanisation, non-coercive preventive and remedial actions would be needed.

Undoubtedly, the ethnic asymmetries within Pakistan's 'elite' and the substantial overlapping of class and ethnicity pose the greatest challenge to removing ethnic disparities and promoting harmony and national integration. Given the ethnic specificity of the armed forces and the spending of the largest portion of the budget on defence, a more equitable distribution of resources among ethnic communities is unthinkable without drastically altering the ethnic composition of the military or/and reducing the military budget. The civil bureaucracy has been more amenable to ethnic diversification, and given sufficient political pressure, the bureaucracy can be made to be more inclusive.

The chasm between the reality and perception of the Urdu-speaking people concerning their deprivation underlines the inadequacy of the paradigms which look at the 'class as a whole' or the 'ethnic group as a whole'. Neither the Urdu-speaking people, 'as a whole', nor the middle class – even the lower middle class – can be

viewed as deprived in comparison with other ethnic groups or the multitudes of impoverished peasants, workers, and the *declassé* (underclass!) elements. The Urdu-speaking lower middle class, having struggled hard to get higher education, found the avenues for jobs and advancement blocked. It followed the model of the deprived or dominated groups (Bengali, Sindhi) to blame ethnic discrimination for its plight rather than following the model of the dominant (Punjabi) group of blaming the 'system' or class oppression. It manipulated the cultural symbols of its group to mobilise the rest of the classes of its ethnic group in a militant nationalist movement.

While national integration is a desirable goal, the primary emphasis on integration in the past has led to oppressive about ethnic diversity and disparities. On the other hand, if the primary emphasis is placed on promoting equity and harmony among different ethnic groups, national unity, security, and integrity would be the logical outcomes. Suppression of ethnic rights in the name of security, unity, or integrity of the country will have the opposite effect.

Myths and Realities of the Chiapas Uprising

James Petras
Steve Vieux

Without minimising the importance of the specificities of Chiapas or the relevance of race/class in defining the originality of the movement; the process of linking local peasant movements with urban activists follows a common pattern earlier played out in Indochina, China and in some parts of Latin America. What made the Zapatista uprising appear novel was the timing – it occurred during a period of worldwide leftist retreat and in particular at a moment when other central American guerrilla movements were laying down their arms and entering into political deals with the neo-liberals in power.

THE Zapatista uprising in Chiapas has generated hundreds of articles and dozens of books. The lines of argument about the origins and nature of the struggle focus on several themes: according to some it is a revolt by poverty-stricken Indians; for others it is part of the new social movements, distinct from the older class-based movements linked to ideologies. One writer has labelled it a post-modern rebellion.¹ These interpretations emphasise the novelty, culture bound and non-ideological nature of the uprising as a means of giving credence to its authenticity, legitimacy and public appeal. The Mexican government and its intellectual supporters, on the other hand argue that while many of the Indian demands are worth discussing, revolutionary outsiders manipulated the local population, exploiting their grievances to further their own political agenda.²

Thus the debate is polarised between the left which emphasises the 'indigenous' origins of the revolt and the right which counters with the notion of 'external subversion' as central to the revolutionary undertaking. The legitimacy of the struggle in both cases is linked to its authenticity which is associated with particular racial/regional origins. This is unfortunate since the legitimacy of the struggle has to do not only with the conditions that gave rise to the discontent, but with the nature of the organisations, programme and leadership involved in the struggle against those conditions.

And in these areas the issue of 'internal' versus 'external' forces is much more complex than a dichotomous view would allow. In brief the fact that organised revolutionaries played an active role in the

formation, organisation and programmatic struggle in Chiapas does not in any way minimise the authenticity or legitimacy of the revolution. Revolutionaries – many of them ethnic and geographic outsiders – helped focus national debate and contributed to negotiations with the state. What is new and authentic is the dialectical interplay between on the one hand the local traditions of solidarity within the communities and local authorities committed to their people and on the other hand Marxist revolutionaries, committed to building a revolutionary movement, with a vision of an alternative society, with both sides capable of learning and adapting to practical experience.

The prolonged process of building the Zapatista movement was based on the reciprocal relations between leftist intellectuals learning the norms and accepting the autonomy of the Indian communities and community leaders attracted and recruited to the prospects of political struggle based on participatory democracy. The Indian communities had a history of relations with leftist political activists, particularly peasant organisers prior to the Zapatistas.³ The decision to build the Zapatista movement – a peasant army linked to the organised community – did not occur in a political vacuum nor did it merely link up with traditional Indian-peasant structures. As one Zapatista community leader stated, "prior to the 1980s we were in the ARIC Independiente. In 1987 the Zapatistas began recruiting people. It covered the whole community and everyone was recruited."⁴

The necessary condition for successful organisation was precisely the combination of prior organisation and the predisposition

to struggle of Indian communities linked to leftist urban organisers respectful of local leaders and structures that facilitated the 'recruitment' of whole communities. To this day, the relations of active solidarity and overlapping membership between guerrilla and peasant communities endure. As one community leader noted, "here in the community, we make our own rules and our own laws. Here there are no representatives from the government."

INNOVATION AND TRADITION

Contrary to the conventional notions of the Zapatista uprising as either a purely indigenous uprising of hungry Indians or a conspiracy of urban Marxists, the Zapatista uprising was a product of the synergy of local activist Indian communities and urban intellectuals each contributing organisational, programmatic and leadership qualities. Each complemented the other: the Indian communities taught the urban intellectuals specificities of the conditions and needs of the local communities, while the intellectuals brought international national, strategic and military-political understanding. Without minimising the importance of the specificities of Chiapas or the relevance of race/class in defining the originality of the movement, the process of linking local peasant movements with urban activists follows a common pattern earlier played out in Indochina, China and in some parts of Latin America. What made the Zapatista uprising appear novel was the timing – it occurred during a period of worldwide leftist retreat and in particular at a moment when other central American guerrilla movements were laying down their arms and entering into political deals with the neo-liberals in power.

By emphasising the coincidence of the Zapatista movement with other revolutionary experiences, we want to argue that there is a continuity with previous Marxist-influenced revolutionary processes; secondly, that Marxist practices and theories of action had continued relevance, that Zapatismo could not be assimilated to any 'post-modern' conception of politics. In sum the Zapatista movement combined innovation and tradition; it was not born from nothing, nor did it simply recycle formulas from the past. The highly political – more specifically anti-imperialist – nature of the movement was clear in the timing of the uprising. As one Zapatista leader put it, "with NAFTA nobody except the rich is going to benefit. We understood this and we rose up."

The tight structure of the local community, the norms and close personal relations were instrumental in facilitating the strategic goals outlined by the guerrilla leadership. This is very clear with regard to the security measures adopted during the prolonged periods of political organisation. As a Zapatista leader put it: "everyone was obliged to refrain from drinking. During the whole 10-year period of clandestine organisation it was important to avoid alcohol, above all for security reasons, because when one drinks he tells all."

The surprise element and the capacity of the Zapatista movement to avoid state repression is rooted in the powerful internal linkages that facilitated long-term, large-scale organising.

The movement was built by political education and direct action which resolved the immediate problems of the communities. While long-term organisation of the guerrilla movement was undertaken, immediate land occupation to provide peasants with land was not uncommon. While describing the building of the clandestine movement, the Zapatista leader also pointed out that: "We threw out the landowners and occupied their land." The social bonds, self-confidence and discipline accumulated for strategic goals also served to solve immediate problems. Moreover, the small victories built the larger movement-infusing the members of the community with the idea that they were capable of winning in struggle and changing the society.

COMMUNITY AND LEADERS

The relation between the communities and the guerrilla leadership is not completely unproblematic. There are differences and tensions. Differences in tactical appreciation and socio-economic needs.

For example the February 7, 1994 government invasion and occupation of the Zapatista communities led to the destruction of the basic food supply. Under severe duress some of the leaders of these communities decided to enter into negotiations with the government to secure economic assistance, thus setting up a parallel structure to the guerrilla/government negotiations. This led other Zapatista community leaders and of course the guerrilla leadership to denounce them as 'traitors'.

A second example of the tactical differences was in the same context of the government invasion in February. The government, feigning 'goodwill' in entering negotiations, suddenly launched a massive military offensive to cut-off the guerrilla movement from its social/political base of support in the Indian communities. Upon hearing of the military approach, the peasant militias were prepared to resist. The guerrilla

leaders counselled tactical retreat: "the [government] deceived us. We were negotiating and all of a sudden, the army enters. Sixty thousand. The people wanted to confront them. The 'companeros' asked, 'why did they [the guerrillas] let them enter?' But the commandantes said we should not fight, that civil society doesn't want a war and that we didn't have to die."

For the peasant militias the issue of warfare was based on a moral distinction between 'good faith movements' and 'bad faith governments'. The question of another instance of broken promises, dishonourable behaviour and deception was foremost in the militia persons' eyes. For the guerrillas, political and strategic military considerations were paramount: the reaction of civil society, the correlation of politico-military forces at the national level, the accumulation of political support. Ultimately the authority, if not the arguments, of the commandantes was decisive. The peasant communities withdrew to the mountains, letting the military occupy their villages. The contrast between the spontaneous response of the peasant militias contrasts with the political calculations of the guerrilla leaders. But ultimately mutual trust and confidence led to what was essentially the correct decision to withdraw in the face of overwhelming force to fight another day. In one sense the resolution of differences could be taken as an example of community decisions being over-ridden by guerrilla leaders. Most likely however the decision was the product of democratic discussion and mutual agreement that retreat was realistic and in the best interests of the community.

COMMUNITY DECISION-MAKING

The transformations in the communities wrought by their politicisation is manifested in the dramatic changes in gender relations and community decision-making. Just as there are democratic debates between militia leaders and the commandantes, so within the communities there are debates and discussion on policy issues. For example, after the decision was taken to withdraw rather than resist the army invasion, there was a second issue: whether the women would also join the retreat or remain in the village. In the initial vote the men decided that they would withdraw and the women would remain. The women rejected that proposal and successfully changed the vote. One community leader described the process in the following fashion: "We met in a general assembly and we decided that we, the men, would go to the mountains. But the women insisted that they would also go and so we all left. We were hidden in the mountains from February 10 to March 2." The voice

and vote of the women was decisive in changing the nature of the retreat and more importantly reflects the respect and consciousness among the militia men that they need to consult with women on questions of survival and warfare.

The change in gender relations is clearly manifest in the community response to the incorporation of women into the guerrilla army and their acceptance of sexual equality in the mountains: "There were many young girls who went to the mountains. The community looked upon it favourably, because they were struggling for all of us. In the mountains they give the women contraceptives and if they wish to marry and she gives her consent, they get married in the mountains. There they participate in everything like the men, some even command troops." The traditional assemblies characteristic of the democratic practices of the local communities incorporate the modern proposals for gender equality from the urban activists, in a case of the complementary reinforcement of democratic decision-making.

COUNTER-INSURGENCY AGAINST SOLIDARITY

The assertion by the government that outside extremists were manipulating local communities and exploiting grievances was contradicted by their counter-insurgency strategy which was premised on the assumption that there were profound strategic links between the communities, based on family, class, ethnic and community ties. The army invasion of February was designed to undermine the economic ties between the communities and the guerrillas on one side and the guerrillas' politico-military support of the communities in their efforts to recover land from the large landowners. The military's principal task was to destroy the food supply, crops, and farm implements of the communities. The purpose was to cut off the food supply of the communities and from the communities to the guerrillas. At the same time, by starving the communities, the government sought to create Indian peasant dependence on state charity as well as isolation from the guerrillas. With imminent hunger hanging over the villages, the government hoped to divide the communities, drawing them into parallel negotiations and thus undermining the guerrillas. One community leader described the process as follows: "The army took everything that we had: it destroyed the potable water pipes, electricity, cattle, food. They destroyed or took everything. Now they try to buy off the leaders. But here in this community those officials who want to buy off peasants cannot enter. If they come in we take them to the mountains, so that

they know what it's like. We are the base of support for the guerrillas. We fed them all. Afterward a great deal of aid arrived and we could rest a bit. Now the conditions are very bad. The army took everything and we can't plant because we don't have seeds; we can't sell or buy what we need either. The blow [the invasion] that the army gave us is going to cost us two years to recover from. The men are in the war and that's delaying the harvest."

The nexus between the guerrilla army, the community militias and the community is based on the overlapping family, community and personal linkages which reinforce class, social and political solidarity. The government's repressive policy is directed precisely at creating conflict and competition for scarce resources between families, communities and the guerrillas. It is clear however that this strategy has had only limited success. Class, ethnic and community solidarity has put severe limitation on the co-optive strategy. The guerrilla-community ties persist despite the army's cutting of the food supply and efforts to end co-operation.

The use of force by the state reveals another of the basic changes resulting from the consolidation of the Zapatista movement: the end of landowner hegemony. The landowners by themselves and depending on local resources can no longer control the region. The landowners can survive only as long as the military is permanently guarding their property. When the military withdraws from a farm, the landlords remove any mobile assets and leave. Zapatista peasants quickly reoccupy the terrain. As one peasant leader noted: "With the army invasion came the big landowners ('finqueros') and they carried off the cattle that they could not take before." Disputed hegemony has been resolved in the favour of the peasants despite the military presence. It is interesting to note that the army was not disposed to stand permanent guard for the landowners despite the regime's hostility to the Zapatista movement.

NOVELTY OF ZAPATISTA MOVEMENT

The Zapatista movement is essentially a guerrilla movement dependent on the peasant communities. It has no 'civilian arm'. Unlike the other guerrilla armies in central America, the commandants must consult with the communities. And the communities are adamant on one point: there can be no peace settlement without first solving the agrarian issues—land reform, credit, marketing, prices, etc. The issues of disarmament and democratisation or more inclusive electoral processes depend first and foremost on meeting the peasant demands for land and justice. In this sense the Zapatista commandantes are fundamentally different

from the Salvadoran, Guatemalan and Nicaraguan leaders who traded off peasant agrarian issues and armed struggle for inclusion in the electoral process. The end result was the upward mobility of the ex-guerrillas (in parliament, NGOs, city hall and other positions) while the peasants were left in the same poor and landless condition. While the other central American 'commandantes' demoted the agrarian reform issue to secondary or worse status to secure a place in the electoral process, arguing that 'democracy' was a 'basic' condition for securing agrarian reform. In practice the electoral process merely confirmed the Right in power and in control of the land. Agrarian reform disappeared as a central demand replaced by the neo-liberal agenda promoted by the right-wing dominated parliaments and presidencies.

In contrast in Chiapas the organised communities insist on agrarian reform and new democratic rules based on their own army as an integral part of negotiations. Disarmament is not a condition of a negotiated settlement; rather the settlement of basic socio-economic questions is a condition for elections and disarmament. As one peasant leader stated: "We are not going

to surrender nor turn over our arms. According to the way the government behaves, we will negotiate or struggle. Here in the community we make our own rules and apply our own laws. Here there are no government regulations."

Self-government by community assemblies is the best antidote to the vertical rulership of the central American commandantes that allowed them to impose their electoral political agenda above that of their peasant supporters. In this sense Chiapas is indeed a new type of politics with a new socio-economic agenda.

Concept

HISTORICAL BACKGROUND

REORGANISATION OF NORTH EAST INDIA SINCE 1947

Editors

B. DATTA RAY and S.P. AGRAWAL

Hardbound

Rs. 600

No region in India has undergone such fragmentation as North-East has in the four decades after independence. The volume is planned to go into the historical background of the problem with special reference to the fragile nature of the administrative unity given to the erstwhile province of Assam by the British; the partition at Independence and the question of ethnic identity including the role of language and the demand for reorganisation. It further examines the consequences of partition and reorganisation particularly on the social and economic developmental process in the region and the political fall-out.

B. Datta Ray is founder-Secretary of the North-East India Council for Social Science Research.

S.P. Agrawal was Director, National Social Science Documentation Centre, ICSSR.

Beyond the Economics of Supply and Demand

Surinder S Jodhka

A Political Economy of Agricultural Markets in South India: Masters of the Countryside by Barbara Harriss-White; Sage Publications, New Delhi; pp 425, Rs 395 (cloth).

...merchants, like peasants, are an 'awkward class' (p 322).

"ALL economic activity is socially constructed: people are organised for work in specific ways as a result of which that activity carries social meaning. Agricultural markets are no exception. It is by means of the social construction of marketing systems that commodities are physically shifted and transformed and that capital is accumulated, its formation is controlled and labour is exploited" (p 227). These opening lines of chapter seven of the book, in a way, summarise the underlying framework of the study and its scope. It may sound rather obvious to an outsider to say that all economic activity is socially constructed, but professional economists rarely operate in this kind of a framework while thinking about 'economic phenomena' or while conceptualising it. Once it is accepted that economic phenomena are socially constructed realities, economics will perhaps have to be done very differently.

It is in this context that Harriss-White's book is an unusual work. It is unusual for two reasons. First, for its theoretical framework which makes it possible for the author to focus on questions that rarely get raised in mainstream economics, particularly while doing field studies. Second, for the comprehensive account that it provides of agricultural markets in the Coimbatore district of Tamil Nadu. She is able to incorporate several sociological and political questions in her study without ignoring the quantitative side of the picture and the questions that concern 'mainstream' economists.

Interestingly, even though the 'political economy' approach has been quite extensively used in the study or theorisations of agrarian markets in India, much of this work deals primarily with pre-capitalist type of agrarian social structures. For example, formulations such as 'forced commercialisation' or 'inter-linked agrarian markets' have generally been used in the studies of 'backward regions' marked by pre-capitalist/semi-feudal relations of

production. Agricultural markets of a more integrative nature that link the rural economy with the urban and regional economy have not been studied very extensively in India from the perspective of political economy.

This study is based on an extensive field-work carried out by the author in Avinashi and Palladam taluks of Coimbatore district of Tamil Nadu during the late 1970s and early 1980s. This work is a sequel to an earlier book by the author on *State and Markets* (1984). Her focus is on understanding the shift being experienced in the local power structure and economy of the region as a consequence of increasing involvement of the landed classes in mercantile activity and the possible implications it might have for policy-makers or development agencies. As summarised in the preface of the book, her main argument is "that *the masters of the Coimbatore countryside no longer have their centre of gravity in land*. They are distanced, but not far, from the site of production. They are a mercantile class deriving most of their resources and economic power from marketing....And this is an epicentre of productive capitalism both in agriculture and industry" (emphasis in original). It is important to understand this new 'dominant class' because "(I)n the countryside populated by small peasants, landless agricultural labourers and wage-workers in the non-farm economy, this commercial elite embodies and wields gigantic economic power. More often than not it also holds the local state in its palm. More often than not, it also subordinates women and low caste people. The local conditions under which the marketed surplus is generated, extracted and redistributed would be high on any reform agenda which reflected the development issues central to the lives of the great mass of Indian citizens with few assets and dim prospects of more" (p 16).

Anyone familiar with the Indian agrarian scene would argue that this has not happened everywhere. The rural rich of India have not entered the mercantile activity in such a big

way in all regions of the country. There are regions where even if they wish to or try to do so they have to encounter stiff competition from the already established merchant castes. Harriss-White is aware of this fact and she is careful enough to not generalise from her study of a Tamil Nadu district. Partly for this reason too her study assumes added significance. The Coimbatore case is important because it provides us with a possible example of how a region would develop and how the socio-economic and political linkages would work if the rural rich were to be in control of the agricultural markets as well.

The Coimbatore district is distinct for two specific reasons. First, for it being marked by a well developed rural non-farm economy which also means that the agricultural producers can look for their credit needs to different sources. Second, for being a district where, unlike most other regions of the country, the dominant trading caste is also the dominant cultivating caste. As many as 80 per cent of her respondent merchants admitted to owning land.

Harriss-White starts her book with a theoretical discussion on the issues relating to the study of markets. She questions the conventional notion of market that views it as an "atomistic realm of impersonal economic exchange of homogeneous goods carried out by means of voluntary transactions". Situating herself in the tradition of 'old' political economy, she suggests that markets should be looked at as 'social institutions' with a focus on the nature of power relations embedded in its structure.

She also examines the frames of reference used for understanding agrarian markets in India. These include the framework of 'semi-feudal mode of production', where the sharecropping producers are exploited by the class of landlord-cum-moneylenders through forced commercialisation theorised best by Amit Bhaduri, Krishna Bhardwaj's 'model' of differentiated peasant production applicable to agrarian regions of owner occupancy, and the framework of 'interlocked markets' in which "the dominant party links terms of contract in more than one type of market, and thereby enhances their power to appropriate surplus" (p 38). However, her region of study has an empirical context with its own specificities and does not really fit into any of these 'models'.

Empirically, according to Harriss-White, the merchant capital can rarely be found in a pure form. Agricultural markets in particular can be marked by extreme diversity and

complexity. Keeping this in mind she identified her central question as "what is the nature of the market institutions which have corresponded to a relatively advanced capitalist agriculture developed under risky environmental conditions?". And her objective was to explore "the socially embedded nature of market exchange and analyse markets as systems reproducing themselves in society, space and time" (p 51).

Although she has presented her data in tabular form and at places has also used statistical techniques, apparently to communicate with professional economists, the real strength of her field-work lies in the use of an ethnographic approach and the participant observations through which she has been able to gather rich qualitative details on the subject.

The initial chapters of the book provide an account of the prevailing agrarian structure in the region. Capitalist production relations have come to dominate in the Coimbatore countryside. Though the agrarian society was differentiated, she found "no evidence of any but occasional cases of credit ties and interlocked money-product markets, between smaller producers and traders". The smaller producers did have compulsions and they often sold their farm surplus to village traders immediately after the harvest at a price lower than what the bigger land-owners could get for their produce by selling in the urban market or by storing it and selling it when the prices went up. Their compulsions, however, were not "the result of debt relations" but were due to factors such as "the inability of smaller producers to hire carts, bear their own transport costs" (p 99).

The labour market was characterised by diversity and segmentation. The textbook principles of supply and demand had little to do with the actual working of the labour market. "A great variety of contractual forms constituted the building blocks of labour relations, and the access to such arrangements was deeply embedded in social institutions of caste, locality, gender and age as well as household wealth." Of particular interest is her discussion of the way caste and gender worked as barriers in the agricultural markets in the Coimbatore district.

Despite there being a large volume of literature on caste in sociological writing, we know very little about how caste works in the labour market in the urban centres. Harriss-White provides us with some very interesting observations on the subject. Caste along with gender, according to the author, works as one of the most important shapers of the labour market. Though traditional caste occupations were only tenuously

adhered to and there was no tendency to employ members of one's own caste, "yet the relatively limited range of castes employed demonstrates the enduring importance of caste in institutionalising labour arrangements" (p 249). Untouchables were only rarely employed by the merchants who often openly expressed their contempt for them.

Caste and gender also mattered in the making of an agricultural merchant. All the traders she interviewed were men. Being a woman was "an absolute barrier to the ownership of a wholesale trading firm". Similarly, caste too was important. Trading in crops was caste specific but it was not as exclusivist as gender. There were cases where the caste barrier could be broken. The relationship of caste to commerce was also place specific. However, it still worked as an important barrier to entry in the agricultural markets.

The most fascinating part of the book is obviously the discussion on the "economics and politics" of the mercantile class. A detailed study of this class is crucial also for understanding the emerging power structure in the agrarian sector of the region. The power that the mercantile class wielded emanated from its economic strength. According to the author's estimation, those who controlled the marketing of agricultural produce obtained on an average 15 times more income than those who directly

controlled agricultural production. Thus, "masters of the countryside were not absentee landlords but the powerful and wealthy agrocommercial elite". Most of them owned land. Owning land gave them a constituency which helped them in lobbying with the state bureaucracy for their interests in the market.

Another source they used for making profits and accumulating surplus was through various kinds of manipulations or what Harriss prefers describing as "economic crimes". These were against the direct producers, consumers, other intermediaries and even the state. She argues that through these manipulations the merchants took away much of the economic surplus.

It is equally interesting to note that these masters of the countryside were still however not the masters of the city. In fact, the top ranking merchants came from non-agricultural backgrounds and showed little interest in land.

Much of the empirical literature on agrarian structure in India has invariably tended to focus almost exclusively on the relations within the sphere of agrarian production or the rural society. By focusing on the interface between the town and the countryside, Harriss-White has in a way opened up a new set of questions that are simultaneously sociological as well as politico-economic.

Developing Knowledge to Combat Transnationals

Swapna Banerjee-Guha

TNCs and India: An Activists' Guide to Research and Campaign on Transnational Corporations by Jed Greer and Kavaljit Singh; Public Interest Research Group, New Delhi, 1996; pp 122, Rs 50 or \$ 5.

THE world economic space since the 1980s has been increasingly dominated by large transnational corporations characterised by universal interdependence and internationalisation of production, capital and labour. Armed with the shibboleth of a free market economy, these corporations have brought within their fold any country or for that matter any region they need by using its economic, social, cultural and environmental characteristics as resources. On the one hand, this has increased the gap between the rich and poor countries and, on the other, intensified inequalities among the less developed ones. Many of these countries have been experiencing a gradual lowering of living standards and reduction in their share of world GDP and organised employment [Sweezy et al 1992] together with a gradual erosion of their technological base, resource controlling capacity and economic sovereignty.

Scaling newer heights of expansion, the transnational corporations in the 1990s have amassed enormous fortunes. The largest 100 among them have built up almost 3.2 trillion dollars of assets, one-third of which has been generated outside their home countries [UNCTD 1993]. Simultaneously they have developed a vertically and horizontally integrated system, especially with the help of sophisticated communication technology that has enhanced their power of control. Massive penetration of these corporations in almost all industrial sectors of the developing countries including financing, marketing and distribution activities has thoroughly distorted their ownership pattern. In such a state of aggression, the need to build up knowledge and resources to oppose these corporations both in theory and practice is urgent. *TNCs and India* by Jed Greer and Kavaljit Singh can be best described as the need of the hour from this viewpoint. While books and articles opposing structural adjustment, new economic policy and transnational corporations are being written, very few efforts have gone to assist researchers, activists and workers at grass roots level and enrich their knowledge to systematically fight these powerful corporations. Greer and Singh have accepted this challenge. Their guidebook provides invaluable information on TNCs for researchers, activists or any concerned

individual. The book has to be judged from this point of view and is not to be taken as an addition to existing esoteric and non-esoteric contributions on transnational corporations. In a real sense, the book is a guide, an excellent compilation of sources of information on transnational corporations at a global level, giving special reference to India.

The authors begin with a simple, brief but incisive account of the characteristics and operations of the TNCs, especially focusing on their pernicious effect on national and international politics, employment, health and the environment of the host countries. Section 2 narrates, again in brief, the highlights of the growth of TNCs in India and the government policies on foreign investment. The post-1980 era has rightly received special attention being the period when the Indian government received the largest ever loan from the World Bank and IMF initiating the structural adjustment programme (SAP) which culminated in the introduction of the new economic policy. To quote Greer and Singh, "the result of these and other liberalising changes was a near three-fold increase in foreign collaborations and an eleven-fold rise in government approved foreign investment between 1991-1995" (p 17). The section concludes with the highlights of the SAP and other policy measures adopted in the 1990s to serve the interest of TNCs giving interesting informative insets on who approves foreign investment or how major international institutions facilitate foreign investments and entry of TNCs in India.

The post-1980 era has also been the era of increasing awareness of people about the menace of transnational corporations and international capital articulated through campaigns and movements organised against respective TNCs. The sections dealing with case studies on such campaigns against Union Carbide, Cargill, Du Pont, Nestle and Enron are not only informative but also analytical in the sense that they investigate the factors that led to the success of each campaign and also pinpoint the general fall-out of such success. Without underestimating the impact of these successes or lessons drawn therefrom, the response of the TNCs to such campaigns should have also been mentioned. For example, Cargill's statement on

withdrawal from Kandla and its subsequent re-entry into other sectors could have formed an inset to explain the global strategies and tactics of TNCs. Mention of various other means of campaigning against TNCs through cultural outlets, posters, pamphlets, etc., adopted by individuals or groups for putting pressure on TNCs is apposite. The list of Activist Resources in India is specially useful.

The invaluable contribution of the authors which makes the book a guidebook in a truly practical sense lies primarily in the subsequent eight sections on various aspects of TNC operations and how to oppose them on various issues. Each section offers exhaustive lists of organisations, individuals and publications along with their addresses that provide the sources of all the necessary information for a specific campaign. Each section also contains important guidelines for specific action/research on TNCs. However, the list of books presented in the section on research seems to be too brief and cursory compared to the exhaustive nature of other materials. In the section on investigation on TNCs the list of documentation sources such as various kinds of corporate directories, company yearbooks, handbooks and newspapers as well as the human sources such as key persons in various professions is especially useful for researchers. The glossary insets (pp 68, 69) and list of NGOs deserve special mention. Compilation of the names of organisations, bodies and contact persons (with their addresses) at cross-country levels pertaining to specific actions, such as actions on labour, legality or environmental considerations, included in the later sections is a commendable feature of the book. The full-page insets (pp 88, 89) suggesting areas of investigation on individual corporate plants would be of special interest not only to a fresh researcher but also to a veteran in case the latter is in need of a checklist. Sources on various industrial sectors deserve special mention as does the section on shareholders' responsibility. The list of organisations engaged in mobilising shareholders' efforts to pressurise the corporate bodies is very apt.

The book will make a very useful guide for any researcher, activist or group venturing to undertake a systematic exposition on TNCs and for those already in the struggle wishing to consolidate their efforts. The book deserves commendation not only for the exhaustive lists but also for the systematic plan of investigation that it offers through its contents.

For Civil Libertarians

A G Noorani

Civil Liberties: Cases and Materials by S H Bailey, D J Harris, B L Jones; Butterworths; £ 27.95.

IN few other walks of life is the saying 'knowledge is power', more valid than in the struggle for the citizens' liberties. This massive work now appears in its fourth edition thanks to the labours of three acknowledged British jurists, S H Bailey, D J Harris and B L Jones. The ambit of the concept of civil liberties itself has widened enormously. Since our courts draw on rulings of English courts and of the European Court of Human Rights this volume is indispensable alike for civil libertarians and lawyers. It has expanded considerably since its first edition came out 15 years ago.

The topics covered are police powers of stop and search of persons; entry search and seizure on premises; arrest and detention; questioning and admissibility of evidence; the law of demonstrations, meetings, assembly and processions and curbing of riots; emergency powers against terrorism; film and theatre censorship; broadcasting and television; obscenity; contempt of court; official secrecy and access to information; the right to privacy; freedom of religion; protection against racial discrimination; immigration law; and a whole chapter containing a good legal commentary on important provisions of the European Convention on Human Rights.

The chapter on northern Ireland, for instance, is directly relevant to the situation in Kashmir and in parts of the north-east. The law in India on sex discrimination and sexual harassment has just begun to grow. We do not have racial discrimination so much as communal discrimination. The *Bombay Times*, a supplement of *The Times of India*, reported on September 13 that in Mumbai "housing societies with predominantly Hindu residents have been refusing entry to members of the Muslim community just because they are Muslims". This report, by two correspondents, Jayceta Chowdhury and Aboozar Kalimec, cited a wealth of details including the testimony of "an official of a construction house" who spoke of this "trend" becoming "particularly noticeable after the 1992 riots especially in south Mumbai and suburban areas such as Bandra, Khar, Kandivli and Goregaon".

Section 21 of the British Race Relations Act, 1976 reads thus: "(1) It is unlawful for

a person, in relation to premises in Great Britain of which he has power to dispose, to discriminate against another – (a) in the terms on which he offers him those premises; or (b) by refusing his application for those premises; or (c) in his treatment of him in relation to any list of persons in need of premises of that description. (2) It is unlawful for a person, in relation to premises managed by him, to discriminate against a person

occupying the premises – (a) in the way he affords him access to any benefits or facilities, or by refusing or deliberately omitting to afford him access to them; or (b) by evicting him, or subjecting him to any other detriment. (3) Subsection (1) does not apply to a person who owns an estate or interest in the premises and wholly occupies them unless he uses the services of an estate agent for the purposes of the disposal of the premises, or publishes or causes to be published an advertisement in connection with the disposal."

The volume contains a commentary on this section based on judicial findings. This is just one instance of the relevance of the work in enforcing the existing law and in highlighting its many inadequacies.

New Economic Policies, Instability and Policy Ineffectiveness

Arun Kumar

A comparison of the trends and the amplitude of fluctuations in several key macro-economic variables in the pre- and post-1991 periods suggests increased economic instability which facilitates speculative activity, especially with financial sector liberalisation and the opening up of the economy.

The author also argues that the increased amplitude of economic fluctuations is a result of the nature of state intervention under the new economic policies which has reduced policy effectiveness. The government is unable to control or regulate the impact of shocks (external or internal) since it lacks the policy instruments or has given up some of them or they are greatly circumscribed by the requirements of the new policies precisely at a time when the economy has become far more complex and is subject to more external shocks.

I

Growth Experience since 1991

THE Indian economy experienced a high rate of growth during the 1980s; its best performance for any decade in the 20th century. With the initiation of the New Economic Policies (NEP) in 1991 there was a slump [Kumar 1993] which was in line with the expectation of most analysts since NEP involving a stabilisation package in the short to medium run are stagflationary. International experience with such policies in the 1970s and the 1980s reinforced this expectation.

The growth rate of the economy picked up rather strongly in early 1994 and reached the level achieved in the 1980s. Hence, it is argued that the NEP have not disrupted the economy (unlike in other countries) and are a success in India. The rate of growth has been positive all along, unlike in the case of many other countries where it turned negative (for instance, the decade of the 1980s is called the lost decade for Africa and much of Latin America). The rate of inflation peaked in August 1991 at 17 per cent and then declined and has been in single digits for the last one year. This is also presented as a success for NEP since in the case of many other countries the rate of inflation went into three and even four digits after similar policies were launched.

It has been argued that a transitional period follows any change in policies so that the launch of the NEP (which also consist of Structural Adjustment Policies) was likely to create an economic dislocation and, therefore, it is no wonder that temporarily the rate of economic growth declined and the rate of inflation shot up. It has been admitted that some sections of the population are bound to be hit harder than others and this is a cost that has to be paid by the nation for a long-run more viable growth strategy.¹

Initially, it seemed that the economic pick-up after the slump in 1991 was due to the continued good performance in agriculture since 1988. It was argued that since the NEP have mostly left agricultural policy alone, the economic upturn reflected the nation's good luck that it experienced a string of average to good monsoons (and no drought). However, since early 1994, the rate of industrial growth has zoomed up and crossed the 10 per cent mark suggesting a much broader recovery (Graph 2).

GROWTH AND FLUCTUATIONS

The question is whether this growth is a part of a trend or just a statistical fluctuation? Data presented in Kumar (1993) suggest that even the 1980s witnessed large fluctuations: There was a strong economic recovery in 1988 after the drought of 1987 but this petered out by 1990. Since 1991 there are too few data points to reliably establish annual trends in most variables so that it is hard to conclude that the economy is on a new growth path. However, there are several variables for which monthly data are available and they may be used to shed light on the issue. This data can be used to compare the trends and the amplitude of fluctuations in these variables in the pre- and post-1991 periods.

Such an analysis can clarify the nature of the current uptrend. If the amplitude of fluctuations has increased and is growing, then an uptrend may only be a part of a temporary cyclical rise. If the fluctuations are a result of the shock induced by the NEP, then that would not be unusual but a trend cannot also be established easily. Finally, growing fluctuations would indicate an instability which would make it difficult to establish a trend or even a regular cycle.

Does the fact of a shock in 1991 make the data non-comparable with the pre-1991

(from 1985) data on fluctuations? The pre-1991 period was characterised by severe shocks to the economy. The 1987 drought was supposed to be the worst of the century [Kumar 1987] and affected output and prices. The oil price shock consequent to the Gulf crisis in 1990 had serious consequences for inflation and BOP. In addition to these shocks, the political climate became unstable in 1987 with the Bofors controversy. This affected investments, specially from abroad. It may be argued that the consequences of these shocks spilled over into the post-1991 period. However, if the amplitude of fluctuations increases in the latter period after declining, then that can only be a consequence of the NEP. Increased fluctuations in the latter period would make it likely that a strong growth from a low base may not be indicative of a rising trend.

Fluctuations in various macro-variables may be interlinked. They may grow in amplitude and be destabilising or die out and be stabilising. If the interlinkages provide a positive feedback from one variable into another, then destabilisation is likely.

Growing fluctuations in key variables would imply government's lack of will or inability to control them, that is, policy ineffectiveness. Governments discovered in the 1930s that macro-economic fluctuations may be dampened by counter-cyclical intervention. However, Kalecki had warned that business cycles would be replaced by political business cycles to suit the needs of the ruling parties and the interest of capitalists so that fluctuations in economic activity would continue. He suggested that from one depression to the next the role of government would enlarge and the welfare state that would emerge would not be to the liking of capital since that weakens its capacity to extract concessions from the state [Kalecki 1971]. Hence the preference for markets over state.

GRAPH 1 INDEX OF INDUSTRIAL PRODUCTION
1980-81 Base

GRAPH 2 GROWTH RATE IN IIP

Markets and uncertainty go together. Individual economic agents are atomistic decision-makers, make mistakes and affect other economic agents who act on these mistakes and cumulatively these result in fluctuations. Economic fluctuations² occur even in the presence of state intervention but an increase in their amplitude over time can be taken to imply a decline in certain kinds of economic intervention by the state and ineffectiveness of policies and/or increased dependence on market forces.

Can monthly data be used to establish annual trends? Yes, but fitting a trend or a cycle to data is a matter of hypothesis. If there are sharp fluctuations, no one cycle or a unique trend can be easily fitted since the pattern may be rapidly changing. Different trends or cycles of varying frequencies may be fitted to data depending on the starting and end points. Hence reliability of conclusion drawn from such data is low.

The NEP not only lay greater stress on market forces but on opening up of the economy to foreign capital. This imposes

constraints on policies since government cannot control the external environment which is governed by international finance capital – a force far more powerful than the Indian state hence able to dictate to it. Since its interest is not just India, but the global markets, it may not be interested in stabilising any fluctuations in the Indian economy even if their amplitude is small by international comparisons. It can and is known to use fluctuations in an economy to extract concessions from national governments. These can further reduce the role of government and accentuate fluctuations.

This is a process of strategic retreat of the state which results in gains to agents in proportion to their strength in the market – which favours the MNCs and local capital. Losers are those who are marginal to the markets and they need state intervention to stay where they are. But since that is in the process of being curtailed, except where market forces need it, it is unavailable or totally inadequate to their needs. Those who are marginal to the markets are then the residual in the system and likely to be adversely affected by growing fluctuations.

II

Overdetermined System and Policy Ineffectiveness

Consider various macro-variables in mutual interaction as given by a system of equations. If there are as many equations as the number of variables, the system is completely determined. The government has no role. If the number of equations is less than the number of variables in the system, then the government can guide the economy by fixing some of the variables such that a desired outcome may be achieved.

Many key macro-variables like taxes are now being fixed so as to encourage private capital since that is the determinant of total investment and not public investment. Concessions to the stock markets, consumption of luxuries and imports are also motivated by the same logic. Hence, the flow of savings and trade deficit are no more under government control.

Further, in an open economy many of the variables like tax revenue, pattern of investments, behaviour of the stock markets, increase in money supply, structure of interest rates and labour policies are strongly influenced by the external environment. The economy and the government can only adjust to these influences and cannot any more use policies to target desired goals like employment generation, control of inflation, low interest rates, low rate of growth in money supply, increase in public investment and control of budgetary deficits.

For instance, it may no more be possible to promote industries with a high employment

GRAPH 3: SAVINGS RATE

elasticity since attracting foreign capital (with high capital-intensity) to cover the current account deficit may be the first priority. Further, tax concessions to foreign capital become necessary even if that leads to a fall in the tax-GDP ratio and a rise in the revenue deficit which results in cut-back in social sector expenditures and slowdown in growth in public investments, etc [Kumar 1995].

Models consist of variables and parameters of relevance to the problem at hand. Some of these are endogenous and the solution of the system consists of the dependent variables as functions of the independent variables and the parameters. Agencies like the government fix the independent variables or the parameters so as to obtain the desired solution. The NEP have led to many of the variables getting fixed by the external environment and change in the inter-relationships among the variables so that government cannot fix the solution. This is policy ineffectiveness.

In brief, while the economy becomes more complex, fewer variables are available to the government to exercise control. The system may even get overdetermined so that not only are no free variables left to fix but government is forced to give up some other variables. In the circumstances, government may not be able to control the amplitude of fluctuations through counter-cyclical policies. If these fluctuations are initiated from abroad, they may be even more difficult to control within a small national economy (Indian GDP is around 1 per cent of world GDP) and their amplitude may depend on the global scenario.

III Variables Considered

In this paper, some of the macro-variables for which monthly data are available and which are mutually interlinked are considered. These variables are important since they determine the base for other variables to act. Data are presented for the period 1985 to 1996 with July 1991 as the divide so that comparisons can be made for the two periods.

The NEP are likely to affect output, prices, budgetary variables, trade and exchange rate related variables, savings and investment and money supply. However, agricultural output is still strongly governed by the monsoons and given that the package of policies under NEP for this sector is still rather thin, this variable is not studied here. Further, for this variable monthly data are not relevant, so the number of points available

for comparison are few. Even tertiary sector data are not available on a monthly basis and reliable data comes out with a substantial lag. Hence only industrial production (IIP) is considered.

The NEP have a large package for this sector and various other variables affected by NEP Impact on this variable—for instance, interest rates, tax policies, trade policies and investments. This variable exhibits a strong seasonal pattern so that its growth rate over the corresponding month of the previous year has been considered.

Industrial growth is linked to total savings (and investment) in the economy. Savings rate is considered here in spite of the data not being available on a monthly basis. Annual data are used. The trends in the primary capital markets and the stock market index are important indicators of private sector investments and are hence presented here. Money raised in the capital market is known to have been diverted to speculation in real estate and foreign exchange markets. Reliable data on real estate are unavailable and are so left out of consideration but the rupee-SDR parity is presented here. The rupee-dollar parity was not considered since RBI has tried to hold it stable for most of the period after 1991.

The rupee-SDR parity is linked to the trade deficit and the reserves position; so these variables are also considered. However, data for trade deficit were easily available for the entire period in rupee terms hence this was taken. Monthly data on reserves were available in dollar terms from 1988 and so the earlier data are presented on an annual basis.

The rate of inflation is important in several ways; so the wholesale price index (WPI) is considered here. Fluctuations in this variable are likely to be linked to the rupee-SDR parity and budgetary policies. More importantly, this variable affects the poor through its impact on poverty. Just as for IIP, this variable is also highly seasonal in character and hence the annual growth rate in WPI each month is considered.

TABLE: FLUCTUATIONS IN THE VARIABLE CONSIDERED
Pre-1991 Compared to Post-1991

Variable	Average/Trend Rate	Variation	CV
1 IIP	Higher trend	Lower	Lower
2 Growth rate in IIP	Higher average	Higher	Higher
3 Growth rate in WPI	Lower average	Higher	Higher
4 Growth rate in M3	Similar average	Lower	Lower
5 Trade deficit	Similar average	Lower	Lower
6 Rupee SDR parity	Lower trend	Lower	Lower
7 ForEx reserves	Lower average	Lower	Lower
8 Net credit to government	Higher growth	Lower	Lower
9 Bombay share price index	Lower trend	Lower	Lower
10 Call money rates	Lower average	Lower	
11 Savings rate	Higher average		
12 Capital raised by private sector	Lower trend	Lower	
13 Revenue deficit	Lower trend	Lower	
14 GDP/M3	Lower trend	Higher	

GRAPH 4: CAPITAL RAISED BY PRIVATE SECTOR

GRAPH 5: BOMBAY SHARE INDEX, RBI

Budgetary variables are considered through the RBI credit to government. Given the importance of the revenue deficit, data on this variable are given here even though it is available annually. Since these variables are linked to the growth in money supply, growth in M_1 is presented here.

The budgetary deficit has a strong impact on transfers to states, capital expenditures, Plan size and expenditures on social sectors. Since the states are responsible for the bulk of the expenditures on the social sectors, their allocations have stagnated as the state

finances face a crisis and even where increases came they lagged behind real needs.

Cuts in capital expenditures and the real size of the Plan have led to non-fulfilment of targets of growth in infrastructure [Kumar 1994]. This not only sets back production and forces price increases but further increases the need for private investment and forces the government to grant concessions which in turn aggravate the budgetary position.

Budgetary stringency also increases pressure for reduction in subsidies on essen-

tial goods and increase in administered prices of basic goods produced by the public sector which results in a cascading effect on prices and affects the poor adversely. For instance, there is pressure for truncating the PDS and raising issue prices to bring them closer to market prices which reduces the government's capacity to stabilise foodgrain prices.

Employment generation is likely to have declined under NEP [Kumar 1995] but monthly data are not available and whatever exists is unreliable. The string of good monsoons may have allowed agriculture to absorb the underemployed but it is unlikely that new jobs would have been created on any significant scale. Employment elasticities for the 1990s have been assumed to be much higher than those achieved in the mid-1980s but there appears to be no basis for it [Kumar 1995]. Hence data on employment has not been considered here.

SOURCES OF DATA AND METHOD USED

Considering the above arguments, monthly data have been used here for the Index of Industrial Production (IIP), Wholesale Price Index (WPI), M_1 , trade deficit, rupee-SDR parity, foreign exchange reserves, net credit to government and Bombay stock exchange share price index. Annual data are also presented for call money rates; savings rate, capital raised by the private sector, income velocity of money and revenue deficit. The sources of data are the various issues of RBI *Report on Currency and Finance*, RBI *Bulletin*, RBI *Annual Report*, and the finance ministry's *Economic Survey*.

Given the complex system that an economy is and the various inter-linkages among the variables considered here (some of these linkages are presented in the previous section) it is difficult to build a macromodel which would do justice to the interlinkages; hence this exercise has not been attempted here.⁴ Further, since time paths of the variables are being considered one would have to attempt dynamic interrelationships among them and most of these are likely to be non-linear so that the complexity would be enormous. Building states for purposes of comparative statics or dynamics would be inadequate to the task.

To study the stability property of the overall system, a dynamic system would be needed. But if such a system is built with linearised relationships, it would amount to eliminating the problem by assumption. In other words, the problem cannot be studied by providing a unique analytical solution to a simplified system. For these reasons, the time path of each of the variable is studied individually.

Multiplier accelerator models of business cycles study variables singly and imply that fluctuations can grow in amplitude under certain conditions and this is certainly more

GRAPH 6: GROWTH RATE IN WPI

GRAPH 7: CALL MONEY RATE LAST FORTNIGHT OF MONTH
Average of Middle Rate

likely with a reduced role of the state. In this paper, the possible interrelationships among the variables are spelt out without giving them a functional form. This gives some idea of the nature of feedback from one variable to another, whether positive or negative.

COMPARING FLUCTUATIONS IN THE TWO PERIODS

There are various methods available in economics to measure the extent of fluctuations in a variable. They may be measured around some kind of an average (static or moving) value of the variable. If

no trend seems to exist, then a simple arithmetic average may serve the purpose but if a trend can be fitted, then the scatter around it gives an idea of the fluctuations.

Whether a variable is free of trend or not requires specifying a model which would indicate whether a trend should exist or not. Even if a trend is fitted it may be necessary to fit different ones for the pre- and the post-1991 periods given the change in policy regime. Even this should be specified through a model of the likely impact of NEP on the variables. If a cycle is fitted it is difficult

to establish a periodicity in a rapidly changing pattern unless there is a theory to specify the parameters.

In the absence of such models specifying the behaviour of either the specific variables or of the system as a whole, no general specification can be valid. As such, in this paper for each of the variables that which minimised the variations (averages/simple trends) seemed most appropriate. These minimum variations in the two periods were compared (see the Table). A visual inspection of the graphs was mostly adequate.

IV

What Do the Data Indicate?

(1) The growth rate in IIP over the corresponding month of the previous year has been graphed (Graph 2) while the data on IIP is in Graph 1. The rate of growth in IIP was higher in the pre-1991 period and so were the fluctuations. After the decline in the growth rate in 1991, the pick-up began in 1993 end. The IIP data indicate that the peaks in IIP in the post-1991 phase were much higher than the average during that year, indicating greater fluctuation in the post-1991 phase.

Growth in IIP is dependent on demand factors like injection of demand by government (say, net RBI credit to government, investment rate in the economy (here proxied by the savings rate) and capital raised by the private sector.

The black economy has a strong influence on this variable since a part of the output is evaded, prices under-invoiced, costs inflated and the cost of production of the evaded output loaded on to the declared output. There are reasons to believe that in the recent period, due to the need to boost the price of their shares many companies may have been reporting a part of their formerly undeclared output [Kumar 1996]. This raises the IIP without the actual output increasing at that rate.

Managements may have been bringing back a part of their funds kept abroad to strengthen themselves. These moves which affect the stock markets and the foreign exchange markets depend on the perceptions of individual managements about the need for funds to counter potential takeover bids, so that they are unlikely to be co-ordinated. This would increase the fluctuations in IIP, stock market prices and the foreign exchange reserves and also raise their average levels.

(2) The savings rate is presented in Graph 3. The savings rate rose steadily till 1991 and then dropped sharply to recover in 1994. Though doubts have been expressed regarding the rise in 1994, if the rate of growth in the economy has picked up as suggested by data, per capita incomes must

GRAPH 8: RUPEE SDR PARITY
Monthly Average

GRAPH 9. TOTAL FOREIGN EXCHANGE RESERVES

have increased sharply and if incomes have got more skewed (which appears likely as indicated in Kumar 1994), the rate of savings should have increased.

Savings rate is a non-linear function of economic activity so that it will fluctuate if incomes fluctuate. Further, any increase in the savings rate based on a more skewed income distribution would narrow the base of growth and aggravate the tendency for the deficiency of demand [Kumar 1995] and if growth slows down, then the rate of savings could again fall. To get on to a higher growth

path requires an increase in the export surplus or the primary fiscal deficit in the budget or private investments. As indicated in Graph 10, trade deficit has sharply fluctuated but not declined. The primary fiscal deficit has been declining since 1991 and private sector investments present a mixed bag.

Capital raised by the private sector has increased since 1991 (Graph 4), but that does not mean a corresponding increase in investments since a part of the funds raised are known to have been diverted to speculative activities in the secondary share

markets and real estate. Since long-run private investments in an uncertain environment are risky (for instance, the threat of entry of foreign capital or of takeover increases risk) and are unlikely to be buoyant.

The continuing growth in the black economy highlighted by the continuing discovery of major scams suggests that the recorded savings in the economy are likely to be underestimated. Further, as discussed above, if private businesses declare their formerly unrecorded profits, then this would reduce understatement and cause fluctuations in the savings rate.

In brief, none of the growth impulses which can take the economy to a new growth path have been strong or acting steadily so that the savings rate is likely to fluctuate under the influence of other variables.

(3) Capital raised by the private sector given in Graph 4 shows a sharp rise after 1991 but also displays wide swings. Graph 5 showing the movements in the Bombay stock exchange share index suggests that the two are not linked. There appears to be no link with IIP either. In 1992 and 1993 when IIP stagnated and industry's profitability declined as compared to 1990, the capital raised increased sharply. In 1995, when both industry's profitability and IIP increased sharply, the amount of capital raised fell.

Capital raised by the private sector does not appear to be crowded out by the public sector. It rose in spite of rising total government borrowings and continuing high fiscal deficit. It has not increased sharply in 1994 and 1995 in spite of lower CRR and SLR and low rates of increase in capital formation in the budget. Even when government borrows, money remains in circulation (M3 has fluctuated sharply, as shown in Graph 12 but its average growth is unchanged as compared to the pre-1991 period) so that funds remain available to the private sector if it mobilises them. The key determinant for raising capital is future profitability and this has been affected by uncertainty due to speculation, hence the stagnation.

(4) The Bombay stock exchange share price index presented in Graph 5 may be taken to represent the all-India share price movements (since it is the dominant market). It shows a gradual rise with small fluctuations till July 1991 but rose sharply with large fluctuations after 1991. These changes are unrelated to growth in IIP (Graph 2) or profitability in industry (as argued earlier) but seem to be based on expectations about the future.

Shares are one of the relatively more liquid assets, specially the ones in Group A. Hence it is easy to speculate on their price fluctuations. Funds can easily flow into or out of the share market and accentuate the

GRAPH 10: TRADE DEFICIT
In Rupees Crore

GRAPH 11: NET RBI CREDIT TO GOVERNMENT

fluctuations here and in those markets which are also relatively liquid, like the call money market and the foreign exchange markets. This affects the velocity of circulation of money, the rate of return flow of funds into banks and the rate of growth of M_1 .

The 'freeing' of the financial sector has had an impact on the stock exchange. With reduced regulation of the financial sector, diversion of funds is easier and that has accentuated the instability (emanating from opening up the economy) in the various financial markets.⁵

(5) Graph 6 presents data on inflation based on the annualised increase in WPI. It bottomed in 1988 and then rose to the peak in August 1991. The curve bottomed out in 1993 and again declined in 1995. The average for the post-1991 period is higher than that in the earlier period. However, the amplitude of fluctuations is higher in the pre-July 1991 phase.⁶

The impact of the various shocks are clearly visible in the graph. The drought of 1987 led to a rise in the rate of inflation and the recovery in agriculture in 1988 caused the

dip in inflation. The oil price shock of 1990-91 sent prices shooting up and this merged into the shock created by the NEP which consist of various cost push elements [Kumar 1994] like the devaluation of the rupee (Graph 8), cut in subsidy and increases in administered prices (to control the revenue deficit).

It needs to be remembered that these fluctuations occurred in spite of the string of good harvests since 1988 and the build-up of stocks of foodgrains, etc. As argued in Kumar (1994), the policy tools were either not used or were ineffective due to the constraints imposed on the government by the NEP. Hence in spite of the stabilising influence of good-to-average monsoons, the rate of inflation not only remained high but fluctuated, indicating instability.

The monetarist explanation of inflation based on growth in M_1 (Graph 12) or net RBI credit to government (Graph 11) is not in evidence. Fluctuations in these variables has increased substantially in the post-1991 phase while the rate of inflation has fluctuated less due to the stabilising influence of monsoons. To the extent the increased fluctuations in these variables may have had an effect, this is also due to NEP. In brief, the NEP are responsible for the continuing large fluctuations in the level of inflation in spite of the good/average monsoons since 1988.

(6) Data on call money rates in Graph 7 are a mixed bag since comparable data are not available for the pre-1991 phase. What is clear is that there have been large fluctuations since 1991. This itself is an incomplete picture since these rates fluctuate on a daily basis and these get masked by monthly data. Recently daily rates are known to have crossed 100 per cent which had not happened earlier.

If only annual averages are used for comparison, then the amplitude of fluctuations is larger after 1991. The rate hovered around 10 per cent between 1985 and 1988 rose to 16 per cent in 1989 and 1990, then fell to 5 per cent in 1993 and rose sharply to 27 per cent in 1994 and fell again to 13 per cent.

The fluctuations in this variable are likely to be related to the revenue deficit and fluctuations in RBI credit to government, M_1 and demand for funds by businesses. Speculative activity in the stock market, real estate markets and foreign exchange markets also affect it.

(7) Graph 8 shows the rupee-SDR parity. The rupee has slipped constantly since 1986. It fell by an annual average of 16 per cent up to July 1991 and then by 21 per cent. In the latter period, there have been discrete jumps as well as steady changes between the jumps thus showing sharper fluctuations around the trend.

GRAPH 12: GROWTH IN M_1

GRAPH 13: REVENUE DEFICIT OF C GOVERNMENT
In Rupees Crore

Pressures for devaluation have been exerted by exporters and international capital. Pressures for changes in the value of the rupee are also linked to movements in foreign exchange reserves, current account deficit and capital inflows – factors relating to the opening up of the economy.

Movements in the value of the currency in an open economy also depend on expectations. If a devaluation or a revaluation is widely expected, then trade flows and capital flows can force it to happen through speculation and that is

why the fluctuations grow. This seems to have happened in the post-1991 period. RBI and the government cannot match the finances of international capital. The only solution is restrictions but that is ruled out by the opening up. Finally, foreign exchange is a liquid asset (more so with convertibility) so that movements in its price lend themselves to speculation which increases fluctuations in its price.

(8) Data on foreign exchange reserves (in \$) are presented in Graph 9. They were more or less steady till 1988 and then declined

till 1990. After that they have risen but with fluctuations. The rise in reserves in 1990 and 1991 are based on IMF borrowing. As argued in Kumar (1994), they have risen sharply due to an increase in the country's liabilities and not because the current account is in surplus (as in the pre-1991 phase). Some of these liabilities like, FII inflows and NRI deposits are of the hot money variety which can fly out of the economy at short notice. Hence even the current 'large' reserves cannot give adequate stability to BOP if there is another decline in confidence in the economy, as in 1990-91.

The increase in reserves is given by net capital inflow less current account deficit. Hence, it depends on tax concessions and interest rate differential with LIBOR which determine capital inflows and on policies to reduce the trade deficit like tax concessions.

In an open economy, leakage of demand from the national economy tends to raise imports faster than exports so that the trade deficit tends to increase. This can be sustained only if there are net capital inflows. This requirement enables foreign capital to extract concessions which tends to lower the tax/GDP ratio and increase the revenue deficit. Further, to prevent speculation in the value of the currency, there is a need to hold large reserves which leads to a rise in high powered money and M_1 .

(9) Movements in trade deficit are presented in Graph 10. It shows that fluctuations have grown after mid-1990. The impact of the oil price shock in 1990 is visible. There is attenuation in 1991 but thereafter the fluctuations grow, indicating the impact of NEP. The data are in rupee terms but since it is constantly devaluing, the increase in amplitude of the fluctuations will be smaller in SDR terms. However, the impact on the national economy is better reflected by the deficit in rupee terms.

The trade deficit is the difference between imports and exports and each of them depends on many variables. For instance, the level of inflation, industrial growth which determines demand for imports and the value of currency which determines exports and demand for imports. Since fluctuations in each of these variables has increased, it is no wonder that the trade deficit also fluctuates more in the post-1991 phase.

(10) Net RBI credit to government (Graph 11) rose without much fluctuation till July 1991. After that the trend rate of growth has declined sharply but fluctuations have grown. Under pressure from the IMF, the government was forced to reduce its borrowing from RBI; quarterly and annual targets of budget deficit were set. Since there were no monthly targets, borrowing from

GRAPH 14: INCOME VELOCITY RATIO
GDP/M₁

RBI could rise in between leading to fluctuations.

With growing revenue deficits and lower borrowing allowed from the RBI, the government has had to depend on the markets and offer market rate of interest to get funds (the same for the PSUs). This leads to tight money supply and increased demand so that interest rates rise which causes the interest burden to rise and increases the revenue deficit. To keep the interest burden from rising rapidly, the government has borrowed from the RBI. These are the contrary pulls leading to growing fluctuations.

(11) Growth rate in M_1 is presented in Graph 12. It shows a high average rate through the entire period (compared to the nominal GDP). Fluctuations increase from 1989, but quite dramatically after 1991. They seem to dampen in 1990-91 but under the influence of the NEP their amplitude increases.

The important sources of growth in reserve money which leads to growth in M_1 are foreign exchange reserves and net credit to government. Since both of them are unrelated and have fluctuated more in the post-1991 phase, it is no surprise that so has the M_1 growth rate.

(12) The revenue deficit of the central government is presented in Graph 13. It shows a rising trend right through the period. It fell a little in 1991 and rose sharply in 1993. Since the data are available on an annual basis, conclusions regarding trends and fluctuations cannot be drawn. Its increase in the post-1991 phase is due to the sharper fall in the tax-GDP ratio as compared to the revenue expenditure-GDP ratio. This is a

result of large tax concessions to capital and specially to foreign capital [Kumar 1995] and the rising interest burden.

The significance of this variable lies in its impact on other variables like RBI credit to government and M_1 . However, its main impact is to limit the growth in (a) transfers to the states, (b) expenditures on social sectors, (c) Plan allocations, and (d) capital expenditures. This reduces government's capacity to intervene and the effectiveness of its policy.

(13) Income velocity of money (GDP/M₃) is presented in Graph 14. Only annual data are available, so too much cannot be read into it. It declines through both the periods but more sharply after 1991. It shows greater fluctuation in the pre-1991 period.

The fall in the income velocity can be due to increasing monetisation of the economy, rising volume of transactions per unit of activity, growing speculation requiring economic agents to be more liquid (and causing transactions to rise) and the growing black economy siphoning away liquidity. Post-1991, all these factors have perhaps contributed due to the growing marketisation and reduced regulation of the economy.

FLUCTUATIONS AND UNCERTAINTY

With growing instability due to fluctuations, economic agents face growing uncertainty. While this makes them cautious about long-run commitments, they see an opportunity for making money on fluctuations in the short-run. Both these

motives require agents to be more liquid: in their portfolios they try not to add illiquid assets like, say, industrial investments. Fluctuations create opportunity for making capital gains on those assets which are more liquid like shares in the secondary market, foreign currency or lending money in the short-term call money markets. Since the fluctuations are unco-ordinated, funds shift from asset to asset so that there can be a positive feedback from one market to another and increase in fluctuations in each of them.

Fluctuations are always present in any economy but in an open economy they may be additionally triggered off by outside events. For instance, FIIs may decide to invest in the secondary stock markets which raises the share price index while simultaneously increasing foreign exchange reserves which triggers a rise in the value of the rupee and money supply and a fall in the call money rates. The RBI has to intervene to hold the rupee stable or imports have to grow.

Government not wanting to discourage the inflow of FII funds cannot intervene counter-cyclically or has done so at the margin. Realising the unstable character of these inflows [Kumar 1994] and worried about the liquidity mismatch between inflows and outflows it did not allow imports to grow fast and let the foreign exchange reserves build up so that money supply grew rapidly. NRIs and Indian businessmen also brought in their funds to take advantage of the high interest rates offered to them and this accentuated the above trend. With a decline in FII inflows, the reverse trend set in.

Speculative activity feeds black income generation, raises the transactions velocity of money, slows down the flow of funds into banks and lowers the income velocity of money. Speculative activity creates transfers but does not generate factor incomes so that the income generation slows down for a given circulation of money. Banks have been complaining that deposit growth has slowed down which is a likely consequence of diversion of funds to holding money or other liquid assets.

In brief, growing instability due to increasing fluctuations causes uncertainty to grow and can create economic slow-down and decline in income velocity of money.

V

The Poor: The Residual of the Fluctuations

By definition the poor are the residual in the market process since they lack purchasing power/financial muscle. Under the NEP which promote markets and force the state to retreat, they get even more marginalised

[Kumar 1994]. For instance, availability of bank credit based on profitability tends to exclude the poor who lack assets for collateral and because they borrow small sums which have high overhead costs. Those with purchasing power can even get financing (and credit cards) for their consumption.

The middle classes with smaller financial capabilities lost money in the financial scam of 1992. Speculation is largely the preserve of the propertied and they are its beneficiaries (even if at the expense of another set of the propertied) but to the extent it leads to uncertainty and price rise or slow-down in productive activity, it hits the poor.

To the extent the budget deficit rises and lowers the rate of growth of expenditures on the social sectors and transfers to the states, it affects the capacity of the poor to overcome poverty. The states are the direct actors in alleviating poverty and with their budgets in crisis, such schemes get adversely affected.

With reduced regulation leading to an increase in the number and the size of the scams the effectiveness of existing schemes decreases. The 'gwala' and the medical equipment scams recently unearthed indicate the growing ineffectiveness of the social sector expenditures. With the legitimisation of money-making in various forms (through productive or unproductive activities) and growing income disparities, illegalities of various description are growing. In turn, this undermines policy so that the much talked of 'safety nets' for the poor cannot be implemented effectively. In any case, they can only be palliative since they only attempt to mitigate that which is being generated by NEP – they do not strike at the root of the problem of poverty but only help mask it.

In brief, in various ways, fluctuations in key macro-variables result in an increased burden on the poor since they are the residual.

VI Conclusions

There are indications that in 1996 the economic growth rate may be on the decline. The growth rate in the IIP has fallen sharply. According to the data for 1995-96, available in the RBI *Annual Report 1995-96*, the quarterly rates of growth in IIP are 14.3, 11.6, 10.8 and 12.0. For April to July 1996-97, data from the ministry of industry show that the quarterly rate of growth may have come down to 5.8 per cent for July 1996 to 5.2 per cent. Apart from the reason that increased demand in the recent period has had a narrow base and for cyclical reasons (which are not expected to continue), infrastructural bottlenecks are likely to have slowed growth [Kumar 1995]. During April

to July 1996, this segment has grown at 3.6 per cent as compared to 12.4 per cent for the corresponding period last year.

Other features of the economy which support the hypothesis of a slow-down in the rate of industrial growth are the sharp reduction in the rate of growth of imports and excise duty collections. First reports are that the corporate sector is experiencing much lower growth in sales and inventory pile up in the first half of 1996. Data on savings are available only for household savings in financial assets (net). After rising in 1994-95 to 11.3 per cent GDP (from 10.4 per cent in 1993-94) they have fallen to 9.1 per cent in 1995-96. With the capital markets in doldrums, less capital is being raised by the private sector and reports suggest postponement of investment plans. All this indicates a possible decline in the rate of investments in the economy and a slow-down of the economy.

In other words, fluctuations in key macro-economic variables are continuing to feed into each other and the sharp upturn since 1994 seems to be giving way to a downturn in 1996. The available official data cannot, then, be taken to indicate that the economy has moved to a higher growth path. It reveals that post-1991 there are greater fluctuations in a large number of key macro-economic variables in spite of the stabilising influence of eight good/average monsoons.

All this suggests increased economic instability which facilitates speculative activity specially with financial sector liberalisation and opening up of the economy. Such trends have engendered greater economic uncertainty which is not conducive to long-run growth and forces economic agents to remain more liquid.

This paper also suggests that the increased amplitude of fluctuations in key macro-economic variables is a result of the nature of state intervention under NEP which has reduced policy effectiveness. The government is unable to control or regulate the impact of shocks (external or internal) since it lacks the policy instruments or has given up some of them or they are greatly circumscribed by the requirements of NEP precisely at a time when the economy has become far more complex and is subject to more of external shocks. Hence, policy ineffectiveness is not only policy failure but also lack of policy instruments.

Notes

- 1 Most analysts agree that the growth of the 1980s was unviable and was leading the nation to a crisis. However, there is disagreement on the reasons for the crisis and the solutions proposed, Kumar (1994).
- 2 Many of the cycle models suggest that the stability of the fluctuations depends on the size of the multiplier (i.e. the magnitude of the marginal savings propensity) and

the accelerator (which provides the feedback and is given by the incremental capital output ratio). Most capitalist economies, without the stabilising influence of the state, would be unstable. For instance, India with an incremental capital-output ratio of around five would be in the orbit of instability.

- 3 They are either the independent variables which other variables depend on or the ones that are the parameters for the model or are in the background and supposedly remaining unchanged.
- 4 It is not that models which interlink hundreds of variables are not available in the literature but these are based on drastic simplification which itself does violence to the relationships. Such models can only claim to represent reality but that is feasible if they exhibit stability. But that is taken to mean that the actual system being studied is stable while that may not be the case.
- 5 The financial sector scam of 1991-92 illustrates this point. A boom was created in the stock market through diversion of funds from financial institutions and fictitious means of creating money through banks.
- 6 The latest data in the RBI *Annual Report 1995-96* shows (p. 38) that even though in 1995-96 the average rate of inflation declined as compared to 1993-95, the variability increased considerably.

Gender and Development in India, 1970s-1990s

Some Reflections on the Constitutive Role of Contexts

Mary E John

The ideologies of globalisation and structural adjustment seek to make one deaf to the immediate past and to anything that does not speak in the language of efficiency. However, the contemporary changes overtaking us, disturbing as they are, also harbour the possibility of bringing our political and intellectual engagements on to new and fruitful terrain. For those who have been working at the interface of gender and development, it is time to refigure their priorities, not by secluding themselves within some putative 'pure' economy, but by broadening feminist conceptions of the economy itself. Rescuing the notion of gender from its ritualistic incantations and making it really work for a more emancipatory and inclusive social order is one of the ways open to them, one they have every reason to take.

I

It is surely a truism today that women's issues no longer belong exclusively to the women's movement, if they ever did. This situation is especially visible in the world of development, and finds its clearest expression in proliferating references to 'gender': in local, national and international fora, among state functionaries, development experts, academics and activists – many of whom would not think of themselves as feminists – one hears repeatedly of gender bias, gender sensitisation, gender planning and gender training, to mention just some of the more common examples of its contemporary use.

As is well known, the whole purpose behind supplanting the older frame of 'women in development' by that of 'gender and development' since the late 1980s in many parts of the world had to do with fundamental shortcomings in 'WID' thinking. To begin with, there was the limited nature of speaking only about 'women' rather than about systemic relations of inequality, involving the relations between both men and women. Secondly, attitudes toward development itself tended to remain insufficiently critical, when the entire process, and especially the assumptions underlying development as such, needed to be questioned if gender issues were to be effectively tackled.

Has the change in terminology, important as it is, produced the intended results? I am not sure, and this paper is an attempt to find out why. With over two decades of development work behind us, first in the name of women and now in the language of gender, the time has clearly come to take stock. Unlike some of the other reviews now coming out [e.g., Young 1993, Moser 1993, Kabeer 1995, Escobar 1995], which are produced in the first world and pose their analyses at a general level, I argue that we need to explicitly *situate* our critical reflections within the histories of specific

third world nations – through their processes of evolution, and in terms of historical shifts in the frameworks within which development is being understood. My own efforts here are tentative and preparatory, somewhat in the nature of drafting the outlines of an agenda and thus making a case for new feminist research.

It hardly bears emphasising that the 1990s have brought the women's movement in India on to new and unfamiliar terrain. Even as we reorient ourselves to the challenges, predicaments – and promises – of the present, feminists are disoriented. A significant response to this situation has been to look back, especially to the last two decades, in order to assess the future.

While I also feel propelled to re-examine the debates and issues of the last 20 years and their connection with questions of development, the crucial motivation for me comes from the experiences and questions of a new generation of women who are in the process of becoming feminist in a world decisively different from the frameworks of the 1970s, which had made post-independence feminism possible. How are women's issues inherited, fought for, carried forward?

In her study of western feminist history from the Middle Ages to 1870, entitled *The Creation of Feminist Consciousness*, Gerda Lerner repeatedly underscores the absence of progression in women's intellectual formation throughout this period: no generation, it appears, was able to build upon the achievements of a previous one [Lerner 1993]. I am less concerned with the plausibility of this historical claim than with Lerner's unspoken assumption about the subsequent history of feminism, which acts as a foil: she seems to be implying that after 1870, with the onset of collectively organised forms of struggle and greater economic independence for certain women, the modes of creating, sustaining and building feminism have been more straightforward.

No doubt, the number of those who have heard of feminism and of women's issues

is steadily growing; there is little danger, moreover, of being lost to posterity. But I am not certain that we have a good sense of how feminism is historically 'passed on', and not simply because we in India suffer the specific disadvantages of a third world nation. The problem may be a new one, having everything to do with the transformed contexts of the 1990s. We are perhaps more accustomed to think of a context as the 'background' to our questions and demands, rather than as the *condition of possibility* of our initiatives, that is to say, as something *constitutive*. However, the kinds of changes taking place today – of which globalisation is the most visible indication – demand a rethinking of the very terms in which women's issues were initially raised and the modes in which they are being reconstituted today.

By drawing attention to the question of contexts, this paper seeks to reframe issues that may otherwise be posed in a misleading way. For instance, these days we often hear of the 'co-option' of the women's movement by other forces such as the Hindu rightwing, the state or certain NGOs. This gives one the impression that the women's movement had a 'pure' beginning of its own, which only subsequently, that is to say, at some later stage, came to be taken over by different, contrary influences. Instead, I will be suggesting in the following pages that the 'beginning' itself cannot be so easily isolated – indeed, multiple players have been involved, nationally and internationally, from the moment of its emergence. What has changed rather – and changed decisively for everyone concerned – is the context, mediated by 'frames' of intelligibility and signification which are themselves the product of a new historical moment, frames effected by 'critical events' that radically transform the political culture within which we live. It is this sense of radical transformation that also affects our relation to history, making it less clear as to how the past is to be a basis for the future. Hence my problematisation of the

question of inheriting feminism today.

Before turning to the beginnings of the women's movement and its connections to development, it is crucial to notice that globalisation, liberalisation and the programme of structural adjustment are by no means the sole forces redirecting contemporary agendas. Rather, a multiplicity of emergent phenomena and realignments characterise the present: nationally, the events of 'Mandal' and 'Ayodhya' have become, in very different ways, part of cultural and political life, and cannot be dismissed as violent, pathological eruptions of little significance to development issues. Equally pertinent, the status of regions is also open to new forms of politicisation. Apparently sutured within a newly-independent India through the creation of linguistic states, regions can no longer be so obviously subsumed within a national frame. Changes such as these make the task of exploring the past from the perspectives of the present a particularly challenging one, since a number of avenues are now available for the process of reconstruction. The contemporary context is, therefore, by no means a deterministic one; it functions more in the nature of setting limits and opening up new possibilities. Thus, for instance, many regional histories of the women's movement would simply not fit the national narrative, either in terms of periodisation or in the light of the variable significance of development issues in different parts of the country. (This does not mean, of course, that regional narratives of development and the women's movement lie outside the 'national' one, or can only be constructed as exceptions. Consider the 'Kerala model' for instance, which in its own time has borne complex relations to gender issues at a number of levels – within Kerala itself, at the national level and, certainly internationally as well.)

In the face of such options, this paper sets itself the extremely delimited task of concentrating on just one strand of the mainstream feminist literature, in order to illuminate changes in development thinking from a national perspective. While Section II looks at historical issues, Section III is more speculative in nature, and raises questions for the immediate future.

II

In the influential and important World Bank report *Gender and Poverty in India* of 1991, principal author Lynn Bennett announces:

...now, researchers, women's activists, and government departments are reaching a new consensus. ...[W]omen must be seen as economic actors – actors with a particularly important role to play in efforts to reduce poverty. [World Bank 1991: iii]

How are we to evaluate such a claim to consensus? What has enabled the spokesperson of an international agency to endorse her own views by clubbing them together with those of feminists in India and representatives of the Indian state, standpoints which have often been perceived as divergent, if not antagonistic?

There is no simple answer to this question. In this section, I make an attempt to lay the ground for an answer through a comparative assessment of two crucial time periods, namely, the decades of the 1970s and 80s (when the debates on women and development first took shape) and the present conjunctures of the 1990s. Claims to consensus, I shall argue, have only become possible because the meanings attached to a range of terms – such as nation, sovereignty, economy, and, above all, development – have changed considerably from one context to the next, and these shifts have in turn affected the way we need to approach discussions about gender and feminism today. My method of exposition here is a textual one: I will try to highlight the transformed context within which contemporary gender issues are situated by focusing on certain key documents that have played a decisive role in framing these issues over the last two decades, of which the Draft *Country Paper* produced for Beijing last year is the most recent, while the early *Towards Equality* report was the most ground-breaking.

Ingrained habits of looking at the past tempt us to think in terms of a single story or a uniform, continuous process. This is true even of the relatively recent past, such as the experience of the last two decades. Thus, for instance, the Draft *Country Paper* produced and circulated by the Department of Women and Child Development in 1994 (in preparation for the 4th World Conference on Women that was held in Beijing in 1995) tries to tell a story of progress, progress in spite of all the hurdles: There is now an increased sensitisation to gender compared with the early "introspections on women's status in the seventies"; it has been a "bumpy ride", we are told, from "women's problems" to "women's perspectives" [Department of Women and Child Development 1994]. Many feminists, on the other hand, assess the situation differently: pointing to signs of growing violence against women, the falling sex ratio, the effects of environmental degradation or the negative impact of structural adjustment, they tend to tell a story of decline.

Such attempts at constructing a history of women in development (whether positive or negative) assert both too much and too little. Too much, because we are not yet in a position to produce such overarching narratives – gender issues, the pace of a

movement, and the modes of theorisation available are simply too complex and contradictory, still too poorly understood, to be couched in unilinear terms of either progress or decline. Too little, because what tends to remain hidden from view in such constructions is the fact that we do not have *unmediated* access to the lives of women. Women's issues are rarely allowed to be – and seldom are – women's issues alone. They are invariably tied, both explicitly and (more often) implicitly, to *other* issues – this is precisely how contexts work. Much more effort is required, as I have already tried to indicate, to highlight the constitutive effects of the changing frames in which gender has been and is being foregrounded.

Though there is a significant history of debates and policy initiatives around women and development during the last decades, it would be quite misleading to believe that women's issues have gained an autonomous space and are now ready to be analysed on their own terms. But it is precisely such an impression that is conveyed by the *Country Paper*, especially in its concluding chapter on women and violence. Though this chapter is quite radical in its account of the violence of marriage for young women barely out of their teens, and the real hazards of the workplace in the field, factory or office, the discussion fails, and not only because custodial rape and other major forms of state violence have been quite disingenuously written out of it.² The trick lies in how this radical tone has been achieved – by pitching accounts of violence in so general and abstract a manner that everyone and, in effect, therefore, no one, is really held accountable. I am, therefore, proposing a different look at the past and the present, one that tries to be vigilant about the shifting modes in which women's issues have been shaped and recast.

How did the 1970s become a 'beginning', a point of origin for the contemporary phase of the women's movement? An answer to this can only be laid out in a number of stages. Accounts of these years have rightly seen them as a crisis period for the Indian state, the clearest indication of which was the rise of a range of social movements at the time. Sudipta Kaviraj has spoken of the crisis of legitimacy suffered by the Congress from the end of the 1960s, which produced fundamental revisions in the Nehru model of politics and planned development, in favour of a more obviously empty rhetorics of poverty alleviation and increasingly centralised forms of government rule [Kaviraj 1988]. And yet, at precisely such a time, the *coding* of the Indian nation as socialist, guided by aims of national self-determination, still shaped political discourse to such a degree that these were also formative for a number of oppositional struggles. What must be presented as a crisis at one level,

I am therefore trying to suggest, was also a re-legitimation of the state at another – as primary organ of governance, and source of potential well-being to its citizens. It was thus possible, and considered necessary, to question the state, expose the hollowness of its claims or the vested interests it harboured, while at the same time demanding a certain accountability through the rights of citizenship. However critical the institution of patriarchy was to become in the self-understanding of the women's movement, especially among autonomous groups, the Indian state has been the movement's most constitutive site of contestation, or so it would like to contend.

The imprint of these characteristics is clearly visible in what came to be one of the founding texts of the women's movement, the *Towards Equality* report of 1974 produced by the Committee on the Status of Women in India. This report is clearly a product of the initial phase of the women's movement and the inception of women's studies in the academy, when there were palpable motivations to demonstrate one's *Indianness*. The middle class women who formed the core of the movement (and supplied the authors of the report) specifically foregrounded rural and poor women in their research and activism, thereby claiming an authentic non-western, nationalist identity. The report is remarkable for its nationalist structure, perhaps even fervour. It is replete with references to the Constitution and its guarantees, to 'nation-building', suggesting measures to enable women in general, and rural and poor women in particular, to play "their full and proper role" in the making of the nation. There is no mention whatsoever of the UN Year for Women of 1975. In other – especially western – accounts of this period, however, this document is seen as little more than an offshoot of the subsequent UN decade, a top-down creation occasioned by international decision makers [see, for instance, Young 1993]. It is less important, it seems to me, to decide as to which perception is more accurate. The point is, rather, that the authors of the *Towards Equality* report apparently felt no compulsion to refer to the international scene, perhaps even actively suppressed it.¹ Contrast this with the 1994 *Country Paper* which was explicitly framed for the 1995 UN Conference: India's path to greater gender awareness is seen to be deeply intertwined with the period of 'contemporary social history' running from "Mexico to Copenhagen on to Nairobi and finally to Beijing" (p 1).

The revelations of the *Towards Equality* report had a shattering effect on a number of feminists 20 years ago. The initial post-independence years were a time of "complacency and acquiescence among women", we are told, since many feminists

at the time had placed their hope on an egalitarian free India and the creation of a welfare state [Desai 1986; see also Desai and Krishnaraj 1987]. From the more disenchanted perspectives of the 1990s, it is not easy to assess the precise nature of the abdication and relegation of responsibility by pre-independence women's organisations to the emergent nation-state, which resulted in the effective containment of pre-independence initiatives and a quietism for close to three decades of post-colonial Indian history. Moreover, we are only beginning to rediscover the range of activities of the newly formed state which crucially implicated women – in the terrible costs of Partition, as well as through a number of legal enactments, of which the fate of the Hindu Code Bill is perhaps the most well known.

But it is clear that a subsequent generation of women in the 1970s were shaken by the absence of a women's perspective in the overall development process and the indifference of policy-makers and planners. As they put it:

Three decades after Independence, and after three decades of planned development, the picture of women's position that emerged was startling in its grimness. [Desai and Krishnaraj 1987: 4]

It is particularly worthy of note how women in the academy were especially interpellated by the *economic* dimensions of women's deteriorating circumstances, an orientation which appeared to be decisively new. "The marginalisation and impoverishment of the majority of women within the transforming economy became the entry point for academics into the movement" [Agnihotri and Mazumdar 1995: 1874]. In the face of the reneged promises of independent India, it was not possible for a tiny group of middle class feminist intellectuals and activists to refer to the experiences of their worlds alone. It was more important to emphasize the exclusion of the vast majority of women from the promises of progress, modernisation and development, than to focus on the gains made by a minority of highly visible relatively privileged women.

In a recent essay, Satish Deshpande has suggested that one of the primary ways in which the Indian nation-in-the-making came to be conceived within the nationalist movement was in the form of an "imagined economy". In this scheme of things, Nehruvian socialism imaged the "patriotic producer" at the centre of the nation at the time of independence, surrounded by the apparatus of state-led planning and industrialisation [Deshpande 1993]. I would like to go on to suggest that during the critical years of the 1970s, the new emphases on development by feminists gave fresh shape and a new lease of life to the 'producer'

in India's imagined economy, by focusing on working women and the problem of the invisibility of women's work.

The kind of supplementary place that had been allotted to women in the community development programmes financed by the Ford Foundation in the 1950s and 60s, which involved training women in the skills of 'family management' and 'home economics', thus came in for vehement criticism. Feminists in the 1970s could now emphasise the utter incongruity of projects meant to enable village women to become, in the words of the director of the Women's Programme in 1959, "a good wife, a wise mother, a competent housewife, and a responsible member of the village community" [cited in Mehra 1983].⁴ They pointed instead to most poor rural women's traditional participation in both agricultural and non-agricultural production.⁵

Many of the chapters of the *Towards Equality* report dealing with religion and culture, the law, women's political status and so on were subsequently superseded in the major campaigns and new forms of scholarship that were to follow from the end of the 1970s. (Or, as in the case of an extremely interesting appendix on women's status in a minority community, which focused on Muslim women, some aspects of the report apparently went relatively unnoticed.) The more strongly highlighted 'discovery' of women's declining work participation rates and the overall worsening of employment opportunities of the majority of India's women became the basis of ongoing work,⁶ and was thus a product of a conjuncture where, whatever the agendas of international development agencies or of western feminists, feminists in India produced national directives, sought to influence state policy, expanded the scope of statistical data collection, and so on, in the belief that this would arrest deteriorating trends. By exposing the ambivalent effects of development strategies that had been designed without regard for women, feminists demanded that policy-makers actively address the invisibility of women's contributions to the making of the nation.

It would take me well beyond the confines of this paper to dwell upon the different and conflicting strands of scholarship on women and development that characterised the 1970s and 1980s, from liberal demands for greater recognition of women's labour to more radical critiques of a development process that had reinforced patriarchal relations of inequality. I only wish to emphasise two things: the proliferation of studies that emerged at the cross-roads of class and gender, which has yet to be matched in any other field, and the special place of the debates on women's work within this nexus of intellectual and political engagement.

Relating to labour force participation rates, problems of underestimation, the sexual division of labour, the household, and criticisms of the very concept of work itself, these debates meshed directly with – indeed, actively reconstituted – prevailing conceptions of India's national identity, and the reconfigured primacy accorded to development. As is well known today, one of the most important results of all this effort was the discovery that women as a group, far from having nothing to do and with plenty of time on their hands, were *more* active than men, even though national statistical indicators would have us believe otherwise.

One of the crucial texts to come out of the subsequent decade of the 1980s was the *Shramshakti* report on self-employed women and women in the informal sector that was published in 1988. Drawing from a now vastly expanded literature and from extensive field surveys in different parts of the country, the authors produced detailed studies of women in the informal sectors of urban and rural India. The report was intended to show women's extremely vulnerable working conditions across diverse occupations under high levels of discrimination, as well as the range of health hazards women were exposed to on an everyday basis. The recommendations of the report – addressed to various ministries and departments at the central and state levels, but possibly also to international agencies – run to almost a hundred pages. Their demands included enlarging the definition of work to encompass all women engaged in production and reproduction, recognising women's position as major rather than supplementary wage earners, and finding strategies to enhance women's control over and ownership of resources. Also important was the demand to extend the rights and benefits of the privileged 10 per cent of the general labour force who make up the formal sector (in the case of the female workforce the corresponding figure is barely 6 per cent) to the rest of the working population. If necessary, a separate labour commissioner needed to be appointed to ensure that women in the informal sector receive the same security of employment.

The special focus of this report on the informal sector, it seems to me, can help serve as a bridge for the 1990s. The World Bank's *Gender and Poverty* report, with which I began, followed only a few years later. The World Bank report draws directly from the efforts of the National Commission on Self-Employed Women and Women in the Informal Sector as well as from most of the literature on women and development produced in India and elsewhere over the last decades. In other words, it is not based on case studies of its own. By drawing upon

the past years of research, activism and government action in India, however, it is able to perform a remarkable feat: lay claim to an overall consensus on the nature of women in poverty, while in fact coming to often diametrically opposite conclusions from prior feminist concerns. This can only be understood, as I mentioned at the outset, by following up on the changed *significations* accruing to a number of terms.

Notions such as development, the economy and national identity, amongst others, have been critically transformed, at times almost unrecognisably so, with the new ideological legitimacy accorded to the market. International discourses, such as the so-called 'agency discourses' of bilateral aid donors or the World Bank, have been adopting this framework at least since the 1980s; official, active endorsement has come in India in the last few years.

As the 'agency discourses' have been saying for some time now, the informal sector is at the heart of the market economy and represents its prime model. In their view, although 'restrictive' third world state regulations are responsible for the growth of the informal sector in the first place, it is nonetheless here that high productivity is possible with low capital costs. Most important of all, since women are seen to predominate in this sector, it is their creativity and potential that needs special attention [for a fuller discussion see Kalpagam 1994].

The World Bank report draws upon this kind of understanding, while simultaneously underwriting the development literature on women in India. The incredible range of tasks poor women perform, their often greater contributions to household income despite lower wage earnings, their ability to make scarce resources stretch further under deteriorating conditions, all of which were documented and debated in the past, are now reworked: through a crucial shift in signification, these findings are no longer arguments about *exploitation* so much as proofs of *efficiency*. As the World Bank report concludes, poor women are clearly more efficient economic actors, with greater managerial and entrepreneurial skills than men. It is in full agreement with the *Shramshakti* report's recommendation that women require greater access to resources, especially credit and social services. But the last thing they need are the conditions of employment that obtain in the formal sector, which would only stifle productivity.

Views such as these are feeding into a moment in Indian history when production itself is no longer definitive for national identity. Or, at least, if we are to take the new ideology of export-led growth quite literally, production today is only meaningful if its destination lies beyond India's national boundaries. Moreover, for a middle class

who now claim to be the nation rather than merely the representative of its citizens, *consumption* of the world's goods is of far greater concern.' Along with these discernible shifts, the crucial relation of the state to the economy as a whole is giving way to a fragile and contradictory welfarism: It is in the social sectors – such as health, family planning and primary education – that governmental intervention is still sought. Here, too, women are uniquely, if problematically, foregrounded – most frequently through marketing contraception for women's empowerment, or in drives to correlate literacy with reduced fertility rates. Development, therefore, is increasingly being referred to as a *social* issue rather than an economic or political one. It is not accidental, I think, that the specifically economic sections in the draft *Country Paper* of 1994 – on women in poverty and the possible effects of structural adjustment – are amongst the weakest in the entire report.

There are some signs that the growing hegemony of the middle class is not confined to its estimated 200 million members. The increasingly aggressive push for the small family norm, the growing incentives in thrift and savings schemes, references in the literature to women as 'household managers' and to self-employment schemes as 'micro-enterprises', point to a peculiar middle classisation (to coin an ugly word) of the poor, especially poor women. The message of the times seems to be that if poverty cannot be eradicated in, as they say, the medium-to-long-term, it can perhaps be endured better through more efficient management. And poor women, as we have seen, are made out to be more promising managers of poverty than their men.

III

How might one respond to some of the changes accompanying the loss of economic nationalism, such as those so briefly outlined above? Most of these developments, of course, have yet to take definitive shape. The promotion of the structural adjustment programme by the Congress since 1991 as 'irreversible' and, by implication, therefore, as uncontestable, even natural, has been strongly opposed within the women's movement, often by drawing upon the negative experiences of other third world countries who have been structurally adjusting since the 1980s. At the same time, however, globalising trends – fostered as much by strengthened western ties as by the sense of economic chaos emanating out of eastern Europe – are rapidly gaining ground, and are already ideologically and physically transforming the landscape.

It may even be too late to position oneself as primarily either 'for' or 'against' such

trends. Moreover, such positioning can get in the way of realising the range of critical work that needs to be done if we are to obtain a better grasp of the shifts taking place. A new generation of feminists do not even have the benefit of having known the kind of left-inspired economic nationalism which many of us could take for granted. Disaster stories of impending doom (produced in tones as religious as those in praise of economic reform), which tend to inevitably hark back to a cultural past free from western domination, appear least useful at the present juncture. Such apocalyptic views seem particularly ill-suited to combating the present, and even less for imagining new futures.

The first task, it seems to me, is to get a better sense of the connections and disjunctions between theory and history. On the one hand, those of us who came to see the frames of political economy as richer, possessing greater explanatory power than the narrower and obviously more questionable assumptions of neo-classical economic thought, may justifiably continue to argue for the strengths of socialist and Marxist-feminist orientations, in spite of the renewed hegemony of the liberal, utility-maximising individual. On the other hand, however, we cannot fail to address the fact that the debates on the political economy of India, which were expanded by the kind of feminist scholarship on women and development I discussed above, seem to have lost their authority in the present climate. The apparent failure of development economics has implied the 'victory' of neo-classical market economics and versions of management theory not out of any intrinsic merit but only by default. The new theories are *not* only *not* better than the old theories, they also mark the radical retreat of economics from the empirical realities it was supposed to explain.⁸

We are thus in the strange situation where, to our minds, superior theories on the strengths of the instruments of planning and the unique institutional tasks of the state have been found *historically* wanting in favour of more simplistic theories of the market. Such a situation seems to point not only in the direction of the failure of a particular economic strategy, but towards a much more fundamental crisis in *economic theory as a whole*. The aura and the rhetoric of economics, however, which are the effects of its power, make this almost impossible to acknowledge. To put it simply, while the field of economics itself is in disarray, the *ideologies* surrounding it continue to be effective.

The recognition that economic theories today are caught within fundamental uncertainties may tempt us to dismiss Fund-Bank thought or managerial economics. But

we may also have to acknowledge that similar uncertainties mark the traditions of political economy and development planning. A number of Marxists seem to be tacitly responding to the new historical situation by qualified references to market socialism.

Along with efforts to reconceive 'the market', I would like to suggest that it is equally imperative to re-examine the state, especially from the perspective of the history of the women's movement. The location of patriarchy within the state apparatus by feminists at an early moment in the movement (and not only or primarily within the family) surely represents one aspect of the genius of the women's movement. This critique of the state, however, has only been a partial one so far. For what are we to make of the routine complaint of a 'gap' between planning policy and its implementation? Even as we have rightly celebrated efforts to overcome patriarchal opposition, such as went into the creation of a special chapter on women in the Sixth Plan (1980-85), similar efforts have not gone into monitoring the actual *practices* of the state, through the implementation of policy on the ground.

Let me take a very recent example from a related context, which exposes the contradictory nature of the state as an institution of power at the level of its practices – namely, the much publicised trial in Jaipur last year of the gang rapists of Bhanwari Devi, the sathin from Rajasthan's women's development programme. Much to everyone's shock and disbelief, the accused were acquitted by the high court, on the grounds that as higher caste Gujjars, they could never have raped a lower caste woman, least of all in the presence of her husband. Subsequently, a large rally was organised against the verdict, and predictably enough, representatives of the state government pledged their support.

What might one make of such contradictions, where one arm of the state is able to protect the accused while the other claims to stand by the victim? Our critique of the state is incomplete because we have not taken its class and caste composition and identifications seriously enough. The state may thus respond – at times with alacrity – to the claims made upon it by the women's movement, whose spokespersons are invariably middle class and upper caste, and who are also familiar with its structures. The story is quite different when it comes to implementing policies or laws in favour of a woman of a different class and caste, especially when it involves opposing those with whom the state identifies.

It is therefore not enough to insist – as many do today – that the Indian state is in principle more accountable than anonymous international capital, given that the government has overwhelmingly failed all

but its privileged citizens. There is more that needs to be understood about the ambivalence of the state from the perspective of its historically evolving participation in the power relations of society. One way to approach this problematic is by studying the state apparatus in the realm of implementation.

These cursory reflections on the uncertainties of economic theory and on the need for a fuller critique of the state (now in retreat) should make us somewhat wary of the kind of confident proclamations about gender that are increasingly in evidence in development circles. Surely there is something deeply ironic about the circulation of phrases like 'gender planning' by development agencies at precisely a time when the instruments of planning are being dismantled the world over. Equally troubling are the often facile forms that references to gender are taking.

I would therefore like to conclude this paper with a critique of the World Bank *Gender and Poverty* report, less in terms of its predictable faith in the market than on the basis of its understanding of gender. Not only is such a deployment of gender, along with references to women's special economic agency, becoming increasingly widespread in our context,⁹ it also interacts quite problematically with other aspects of our casteist and communal culture. Let me explain.

According to the World Bank report, the major axis of gender discrimination in Indian society arises from the inside/outside dichotomy:

The culture's very definition of the female is her association with the 'inside' – the home. By contrast, men belong to the 'outside', where livelihoods are earned and political and economic power is wielded (p xv).

To begin with, of course, there is nothing particularly Indian about such a dichotomy – consider the centrality of the public/private distinction for theorising gender in the western world and elsewhere. Secondly, this distinction is open to considerable confusion. Only a very small percentage of women are in fact exclusively associated with the 'inside' – sections of the urban and rural middle classes – and their numbers are decreasing. The vast numbers of poor women who have to work, and the much smaller numbers of more privileged women who pursue careers are deeply enmeshed in the public sphere, though in very different ways. Gender norms for women in the 1990s are in any case being remoulded: the new cosmopolitan role model, as Sushmita Sen expressed it after receiving the Miss Universe crown in 1994, is one who can be "a perfect housewife" and still "go out and get what she wants".

Thirdly, and less obviously, it is particularly misleading to associate men as a unitary category with the outside world of

economic and political power. Such power is in fact in the hands of very few men, who are upper caste and Hindu, and middle or upper class and who may constitute no more than 10 per cent of the male population. For men from disadvantaged groups – disadvantaged by poverty, caste or minority status – the question of access to the 'outside' world of power needs to be specified and qualified.

Recall that the conceptual breakthrough represented by the notion of 'gender' lies in its status as a *relational* term, where an understanding of the specific forms of exploitation and domination suffered by women requires taking the world of men into account as well. How, then, might one conceive of the gendered relations of power between men and women from those exploited sections of society, with which development is most directly concerned? Matters become even more challenging if we heed Kancha Ilaiah's new study of the culture and economy of the dalitbahujans: patriarchal practices exist here too, he says, but without the existence of the "private" realm (Ilaiah 1996: 39-40). This is a clue with immense implications for the world of development. For this means that the gender relations most relevant to us must involve the following complex relations of power between women and men: between women, who do not know the realm of the personal and private as 'we' do; and men, who are excluded from the dominant order of things, that is also to say, from the dominant order of patriarchy and its norms of masculinity (the bread-winning, caring male, sufficiently certain of his power *vis-a-vis* his women and other men, to be able to be a 'man'). I don't think our existing conceptions of the family and the household, and of the forms that patriarchy takes in these circumstances have sufficiently addressed the real complexity of such relations.

Unfortunately, however, too many contemporary references to gender tend to collapse back on to women. For example, recent discussions on the 'feminisation of poverty' or of the 'feminisation of labour' under structural adjustment end up treating women and poverty, or women and the new flexible reorganisation of labour processes in the informal sector, as more or less synonymous.²¹ But what is much more troubling is that the discovery of women's economic efficiency ends up effectively collaborating with views of marginalised men as incapable and irresponsible. Under the present dispensation (where the new economic policy is by no means at cross-purposes with an upper caste communal culture), poor women are being feted as 'good' subjects who make 'sound economic sense', whereas their unruly men, seen as prone to violence, especially if they be dalits

or Muslims, become the 'bad' subjects of modernity and its rationality, undeserving even of the rights of citizenship.

I began this paper with some remarks about the problems of inheritance for a new generation of feminists, in the face of the enormous changes in context that have brought us from the 1970s to the present. The ideologies of globalisation and structural adjustment seek to make one deaf to the immediate past and to anything that does not speak in the language of efficiency. Given such difficulties, I have tried to reconstruct the 1970s in terms of its frames of signification – the 'glue', so to speak, provided by the socialism and nationalism of the women's movement, which foregrounded the state as well as the mass

of non-middle class women whose unrewarded labours were yet to be written into national policy. That particular glue no longer sticks, or so it seems today. Then as now, various forces at the local, national and international levels have been speaking in the name of poor women or the 'grass roots'. What is new is that the nationalism of that time is now being subjected to unprecedented pressures from without and within, making it important to envisage how one might lay claim to a history of struggle.

I would like to believe that the contemporary changes overtaking us, disturbing as they no doubt are, also harbour the possibility of bringing our political and intellectual engagements on to new and fruitful terrain. The time has long come for

those who have been working at the interface of gender and development to radically refigure its priorities, not by secluding ourselves within some putative 'pure' economy, but by broadening feminist conceptions of the economy itself. Rescuing the notion of gender from its ritualistic incantations and making it really work for a more emancipatory and inclusive social order is one of the ways open to us, one we have every reason to take.

Notes

[This paper developed out of talks given at the following places: IV Annual Conference of the Indian Political Economy Association, Hyderabad Central University, January 20-22, 1995; Madras Institute of Development Studies, November 13, 1995; and the VIIth National Conference of the Indian Association of Women's Studies, Jaipur, December 27-30, 1995. The comments and questions of the audiences at these venues are gratefully acknowledged. I have also benefited from the discussions of the law group at Anveshi Research Centre for Women's Studies, Hyderabad.]

- 1 I take this phrase from the title of Veena Das' recent book [Das 1995]
- 2 The authors of the *Country Paper* are quite self-conscious about the advance their chapter on violence represents -- as they expressly state, the *Towards Equality* report had not even conceived of its necessity
- 3 In a recent overview of this period, Indu Agnihotri and Veena Mazumdar quite readily acknowledge that "international developments...influenced the movement in India from the start" [Agnihotri and Mazumdar 1995:1869]. But when it comes to setting up their account of the movement, the frame they adopt is straightforwardly national.
- 4 In an important recent study, Maitrayee Chaudhuri has rediscovered the report 'Women's Role in Planned Economy' produced in 1938 by an all-women sub-committee of Nehru's National Planning Committee [Chaudhuri 1995]. What is remarkable about this document is the degree to which it participates in the Nehruvian 'imagined economy' by stitching together the citizen and the producer in its special focus on women's life and work. In Chaudhuri's estimation, this report even manages to cast post-independence studies of the 1960s and 1970s in a poor light. Her study unfortunately forecloses on the crucial question as to why this document subsequently disappeared from view, so much so that the far more conservative programmes of community development came to be implemented in the 1950s and 1960s.
- 5 In emphasising the centrality of women's status as workers, I am not trying to suggest that feminists were not carrying out important analyses in areas such as nutrition, consumption and the realm of the household, far from it. My point is rather, that even in these fields it became necessary to displace the exclusive focus on mothering in favour of a broader conception of women's activities. As the title of a typical essay put it, 'Who is Malnourished -- the Mother or the Woman?'

[Jayaram 1980].

- 6 Here is a sample from the early phase: Banerjee (1978), Bhasin (1977), Gulati (1975), Mazumdar (1978), Agarwal (1981) and Saradamoni (1983).
- 7 For a fuller discussion of the ideological shift among the dominant classes from production to consumption, see Deshpande (1993).
- 8 In a recent workshop on feminist approaches to economic theory, it is interesting that different kinds of neo-classical and liberal economic theory came in for much more discussion than Marxist economics [Krishnaraj 1995].

One of the shortcomings in the new literature on gender and development is that different approaches to development, whether they be, say, neo-classical cost-benefit analyses or the structuralist perspectives of Marxism, all tend to be presented as more or less equivalent because of their shared limitations in incorporating gender issues. We thus get no sense of how any of these theories emerged historically, nor what their present functions in specific contexts might be. Even in as insightful a study as Naila Kabeer's which strongly emphasises the need for an institutional approach to gender as a relation of power, the institutions in question -- the state, the household, the market and the community -- remain abstract and without history that is to say, without effective content [Kabeer 1995].

- 9 The language of women's economic agency has already been so naturalised in the *Draft Country Paper*, that it even attributes this style of thinking to the *Towards Equality* report.
- 10 For a good discussion of the question whether a feminisation of labour can be said to be taking place in our industrial context, see Shah, Gothoskar, Gandhi and Chhachhi (1994). An early treatment of this issue was initiated by Krishnaraj (1987).

Bill Clinton's Moribund South Asia Policy

Harold A Gould

The United States' south Asia policy of favouring Pakistan embodies the flaws and misconceptions inherent in the doctrine of containment. Driven by obsessive fears of the spread of Soviet and Chinese military power and sponsored domestic revolution, the US leadership made anti-communism the virtually exclusive criterion for determining a country's political value to US strategic interests. It ignored regional socio-historical realities of anti-colonialist nationalism and communalism and got enmeshed in the region's internal affairs as a partisan player. But succumbing, even in the post-cold war period, to the various parochial interests that profit from a perpetuation of the cold war subculture weakens America's chances of helping peace, prosperity and political stability in south Asia.

IN 1953, as the cold war was entering its most virulent phase, the incumbent Eisenhower administration initiated a policy toward south Asia whose ostensible purpose was to shore up a zone of perceived vulnerability in the *cordon-santaire* which the US and its principal allies had been attempting to erect around the existing perimeter of Soviet power since the end of the second world war, and of Chinese power as well after Mao's victory over the Nationalists in 1949.

The attempted establishment of a ring of deterrent power around the communist world as the most effective means of protecting what were conceived to be vital western material, political and cultural interests was, as is well known, the concrete by-product of the doctrine of containment, whose fundamental premises were to a very great extent enunciated by George F Kennan¹ and Paul Nitze.²

The translation of this doctrine into concrete policy undertakings was begun during the Truman administration at the urging of policy advisors like Clark Clifford, George Elsey, Dean Acheson, James Forrestal and others of like mind and credentials, upon whose biases and perceptions Truman was highly dependent due to his own lack of any great depth and sophistication in world affairs. At the time of his selection as FDR's running mate in 1944, Truman was a parochial, machine-bred, mid-west politician. He had not been anointed because of his foreign policy or indeed any other major policy capabilities, but simply as a means of keeping the vice-presidency out of the hands of the Democratic Party's radical left wing at a time when Roosevelt's health was obviously failing fast.

In these circumstances, Truman's ascent to the presidency placed a person at the helm who, although by no means politically talentless, was not at the commencement of his presidential tenure as intellectually equipped or emotionally inclined, as Roosevelt clearly was, to confidently project his own independent perspectives on international problems into foreign policy deliberations with advisors who were largely better educated, predominantly East Coast

Establishment, and products of essentially conservative, traditionalist socio-political backgrounds. As one analyst puts it, in part as a consequence of their class and interest orientations, and partly in deference to Truman's experiential limitations, "US officials defined the Soviet Union as the enemy" and drew their policy conclusions from this simplified formulation:

Rather than dwell on the vacuums of power in Germany and Japan, rather than focus on the popular desire for reform and recovery throughout Europe, rather than emphasise the indigenous sources of civil strife in Asia, and rather than identify with revolutionary nationalism in the third world, they latched onto an interpretation of international developments that placed blame and responsibility on the Kremlin.

This mode of thinking was congenial to Truman:

By simplifying the threat, depicting the world in bipolar terms, and naming the Soviet Union as an ideological enemy, the president and his advisors found it easier to resolve the ambiguities in the international situation and to take the necessary steps to enhance US security interests.³

Thus, driven by a simplistic, and some would say class-specific view of the state of the world, did the cold war commence for America. It would be a contest which on both sides revolved around a quest for security through the creation of conventional alliance systems and power balances spiced with intense ideological competition.

The evolution of NATO set the standard for this approach to international security. In place by the conclusion of the Truman administration, it became the perceived necessity of the successor Eisenhower administration to extend its logic beyond Europe to other regions of the world thought to be threatened by international communism. Although Africa and Latin America were included in this conceptualisation of communism's threat to western resources, territories, and institutions, the principal extra-European danger to western survival during the Eisenhower administration was perceived to emanate from Asia.

There were two impetuses for this enlarged security concern. One arose from Mao

Zedong's ascent to power in mainland China; the other from growing political instability in the west Asia. The latter appeared to afford opportunities for communist subversion if not Soviet conquest (or perhaps a combination of both) whose result would be denial of the region's crucial oil and other strategic (including geographic) resources to the west. The rise of Mao, the isolation of what remained of the Chinese nationalists on Taiwan, the ensuing Korean war into which the communist Chinese regime intervened at great military and political costs to the US, and the disintegrating position of the French in Vietnam in the face of the mounting Vietminh anti-colonialist insurrection were seen as posing a dire threat to Japan and western security interests generally throughout the entire Pacific Basin.

Domestic political turmoil added further fuel to the fires of fear and insecurity which beset the US public and its policy-makers at this juncture in time. Faced with mounting right wing criticism of the policies pursued towards the Soviet Union and China as the second world war was drawing to an end (which allegedly were responsible for leaving Russia in control of eastern Europe, allowing Berlin to become an isolated pocket surrounded by Soviet military and political power, and failing to prevent the fall of the Chiang Kai Shek regime in China), and towards alleged laxity concerning communist penetration and subversion of American public institutions (including the state department), both political parties descended into a nationally debilitating mud-slinging contest over which of them was certifiably the most patriotic and *ipso facto* anti-Communist. The principal casualty of McCarthyism aside from the scores of public servants, intellectuals, writers and artists whose reputations were destroyed and talents lost to the country for a generation, was the possibility of less ideologically strident foreign policy formulation at a time when cool heads and mature judgment might have prevented or at least reduced the severity of a new arms race.

From this morass of international high anxiety and domestic political masochism emerged America's cold war policy for south

Asia during president Eisenhower's first term. What the Truman administration was still contemplating as it left office in 1952, the Eisenhower administration brought to fruition by 1954 through the determined initiative of secretary of state John Foster Dulles and his closest advisors.⁴ This was the recruitment of Pakistan into alliance systems whose ostensible purpose was to simultaneously enhance both west Asia and south-east Asian security while making south Asia itself less vulnerable to communist penetration.

History has shown that the decision to promote the building of a Pakistani military machine as a means of deterring communist bloc expansion into the west Asia, south Asia and south-east Asia was a tragic failure. Domestic communism was never a significant threat to either Pakistan, India or indeed any other south Asian state. Regional political stability was not enhanced but exacerbated by the introduction of the cold war into south Asia. American influence and prestige in both major south Asian states was diminished over the long run (and is in danger of declining further) by its dogged adherence to a misguided and unworkable policy. With regard to the west Asia and south-east Asia, Pakistan's membership in the two treaty systems established to control events in those two regions (CENTO and SEATO) in no way prevented the eventual disintegration of the security structures which Pakistan's participation was supposed to enhance.

REGIONAL AND GLOBAL IMPERATIVES

If this conclusion is accurate (and I concede that there is no unanimity about this) then the question is why was such a policy pursued? The answer requires that we, for analytical purposes, do something which US policy-makers, to their eventual discomfiture, failed to adequately do (and continue not to do): that is, adequately factor into their political calculations the two levels of social reality confronting the US (or indeed any outside power) at this time in south Asia: viz, the regional and the global. Admittedly, it can appear trite to put it this way, because this is axiomatic for any portion of the world towards which foreign policy must be formulated. What nevertheless makes it poignant for south Asia is that history seems to have gone out of its way to make the reconciliation of these two aspects of social reality especially challenging there. The social, religious and political cleavages besetting south Asia by the conclusion of the second world war were so great and so complex that even the wisdom of Solomon might have been hard-pressed to build a foreign policy that successfully avoided their pitfalls. Yet, as an emergent superpower

confronted by a rival superpower seemingly determined to contest its hegemony on both political and philosophical grounds in every region of the world, nobody faults the US for trying. The US leadership clearly had understandable grounds for wanting to create policies which attempted to counter this comprehensive challenge to its material interests and fundamental values. The problem arose at the level of political judgment as to how to go about it.

Not that American officials were totally unaware of the powerful social forces that had determined the manner in which south Asia was entering the post-war world or that these indigenous forces would have to be factored into any policies undertaken toward the region. During the second world war, in fact, the Roosevelt administration had in many ways shown greater insight, sensitivity and sympathy toward Indian nationalism than had India's British masters.⁵ What was lacking at this juncture in history was a sophisticated comprehension of how these forces might affect American efforts to develop a south Asian policy that genuinely served American long range global strategic interests in the post-war political environment.

This perceptual inadequacy grew directly out of the strategic fallacy inherent in the doctrine of containment. Driven by obsessive fears of the spread of Soviet and Chinese military power, and sponsored domestic revolution, the US leadership made anti-communism the virtually exclusive criterion for determining a country's political value to US strategic interests.

Governments outside the Soviet/Chinese orbit unwilling to recite the anti-communist litany were, even when politically moderate and/or pursuing independent nationalist agendas, subverted and replaced, where possible, through covert CIA operations (such as Iran, Guatemala and Chile) or diplomatically blacklisted where subversion proved unachievable (as with India, Indonesia and Egypt). In his brilliant refutation of George F Kennan's anonymously authored *Foreign Affairs* article enunciating the containment doctrine, Walter Lippmann called for a pragmatic, flexible strategy for dealing with the Soviet challenge that "instead of seeking to 'contain' the Soviet Union all over the Eurasian continent" by organising "an ideological crusade" against them, and by trying "to make Jaffersonian democrats out of the peasants of eastern Europe, the tribal chieftains, the feudal lords, the pashas, and the warlords of the Middle East and Asia", (p 44) sought instead to pursue policies that disdained ideological evangelism and enabled us "to be the friend and the champion of nations seeking independence and an end to the rule of alien powers".⁶

Lippmann's formulation implicitly, in other words, recognised the importance to strategic planning of tailoring global diplomacy to regional social realities; to the cultural, historical and ideological nuances that operated in the international grass roots; to post-war nationalism. It should be reactive and flexible instead of monolithically fixated on an ideologically imposed litmus test of political worthiness or trustworthiness. It should be tolerant of diversity where such tolerance offered opportunities to deny strategic advantages to one's adversary. Lippmann's formulation, in short, was the diametric opposite of the American foreign policy that culminated in the John Foster Dulles formula for coping with the Soviet/Chinese challenge to the west.

Within this framework, the Pakistan policy embodied all of the flaws and misconceptions which beset containment. It ignored regional socio-historical realities, the most important of which were anti-colonialist nationalism and communalism. It projected the European experience with the rise of fascist totalitarianism during the inter-war years (allegedly the cause of the second world war) onto the cold war's periphery where it had little or no analogical relevance, resulting in foolish strategic decisions such as our military interventions in both south Asia and Vietnam. It fostered intellectual superficiality about third world politico-economic doctrines: failing, for example, to distinguish between different forms of socialism, many if not most of which (such as in India) were anti-Stalinist, jealously nationalist, dedicatedly democratic, strongly resistant to internal political subversion and, therefore, potentially useful resources for American foreign policy.

The fundamental error which this dominance of ideologically-driven global anti-communism caused the US government to make in south Asia was to publicly accept as a matter of policy (regardless of strong private doubts) the assertions of the Pakistani leadership from 1952 to 1954 that their willingness to join the political premises when, in fact, their real reason for doing so was to obtain the military wherewithal to eventually wage war against India, the only enemy with which they were genuinely preoccupied. The result was to implicitly enmesh the US in the region's internal affairs as a partisan player in the separatist movement which in 1946 had cleaved South Asia into two separate, deeply antagonistic states.⁷

Enhancing Pakistan's arsenal and incorporating them into our alliance systems had two deleterious consequences:

(1) We created a false impression in Pakistan that, despite the formal restrictions we placed on our military assistance to them (viz, that they must not use these arms against India), we tacitly sided with them over Kashmir and

shared their fears of Indian hegemony and that, therefore, they could count on the US to support them in future military confrontations with India. As time passed, this became an increasingly onerous burden on the relationship (especially, when Pakistan attacked India and we not only refused to help but actively endeavoured to restrain them by cutting off their military and economic aid) which virtually negated whatever practical value it originally had.⁸

(2) We further exacerbated our already tenuous relations with India, the largest and most important power in the region, and the only mature democracy, by increasing the Pakistani threat to her security, causing her to eventually look elsewhere for compensatory military and political support, and undermining Jawaharlal Nehru's efforts to keep the cold war out of South Asia. This latter, as is well known, was fundamental to the non-alignment policy which defined Nehru's identity as an international politician. And because this was the case, neither he nor the rest of India's political establishment ever really trusted the US again.

This permeation of US foreign policy with anti-communist ideology which led to the misbegotten Pakistan alliance created a subculture of perception and interaction between America and India dominated by pique and mutual frustration that persisted not only through the cold war but into the post-cold war era as well, right up to the present. And ironically, the alliance policy itself, which at its inception was adjudged worth the price of the bad relations with India that would have to be paid for it, led to a similarly frustrating, piquish, and counter-productive relationship with Pakistan itself which also continues to plague US south Asian policy to this day. The reason, of course, as every anthropologist knows, is that subcultures die hard, even in the sedate world of diplomacy; once created they tend to take on a life of their own which can persist long after their original purpose has ceased to be relevant.

At every subsequent milestone after 1954, cold war ideology overrode all other considerations in the determination of US policy toward south Asia even when at times a given policy did in fact make sense from a regional grass roots standpoint.

The first post-alliance milestone, interestingly, came during the second Eisenhower administration after Eisenhower himself came to the realisation that in Pakistan the US had acquired a political tar baby. By 1957 he declared, "our tendency to rush out and seek allies was not very sensible", and that our military commitment to Pakistan "was perhaps the worst kind of a plan and decision we could have made... a terrible error but now we seem hopelessly involved in it."⁹

In an effort to redress what he perceived to have been a mistaken policy, the president reached out to Nehru, visited India himself in December 1959 (after Nehru had visited Washington in 1956), and took the position in his own councils that a democratically structured, politically stable, economically viable India, despite being a non-aligned, ostensibly socialist state, was after all an asset to American strategic interests. Yet, the compulsions and intellectual conventions of the cold war had become so deeply entrenched in the Congress, the military, the press and the public that Eisenhower found himself imprisoned by political conditioning which McCarthyism, his own secretary of state, and indeed opportunistic aspersions he had cast upon the loyalty and integrity of his predecessors during his presidential campaign had wrought.¹⁰ Once you were in, you could not get out. "Not even the programme's most severe critics in ICA and the State Department", says McMahon, "considered an aid cutback either practical or prudent. Most believed, on the contrary, that any direct pressure on Karachi in that regard would probably just exacerbate the country's massive economic problems."¹¹

In the following administration, president Kennedy was able to carry reconciliation farther, but ironically only so long and so far as it could be justified in the name of the cold war. The major shift toward economic aid for India as a means of keeping her politically stable and economically viable was conceived and justified as a means of deterring India from succumbing to post-Stalinist Soviet political and economic blandishments.¹² India's only flirtation with serious military ties to the US also occurred as a by-product of the cold war, during the desperate days in 1962 when Chinese forces inflicted a devastating defeat on the Indian army in NEFA and appeared ready to follow it up with an invasion of India itself. When these threats abated, however, and India no longer felt as dependent on the US military umbrella, to the annoyance of the US she resumed her non-alignment posture. The cold war had given and the cold war had taken away!¹³

The erratic pattern continued over the ensuing four years: The Johnson administration became increasingly incensed with Ayub Khan when he reacted petulantly to their decision to provide modest military assistance to India, so that she could reinforce her China border, by threatening to 'reappraise' Pakistan's commitments to SEATO and CENTO, undertaking political overtures to both the Soviet Union and China, and continuing a process of expanding relationships with other non-aligned states around the world which had commenced in 1962. Coming at a time when the US was being led into the Vietnam quagmire by a

monumentally temperamental president desperately searching for legitimization of this policy from the world community, the Pakistani leadership could not have chosen a more inopportune occasion to antagonise its principal benefactor. In McMahon's words, "With the righteous arrogance of decision-makers convinced that their view of world affairs could brook no responsible dissent, Johnson and his senior advisors condemned what they considered the reckless and irresponsible behaviour of a once loyal ally."¹⁴

Annoyance turned to rancour in 1965 when president Ayub Khan unleashed his American equipped army upon India in a dramatic attempt to settle the Kashmir dispute by force. The tar baby had come home to roost once again as an embarrassed Johnson administration, confronted with a Congress that wanted to terminate all aid to both India and Pakistan, found itself compelled to impose sanctions on both sides and, in the end, abnegate what was left of its leadership position in south Asia by stepping aside and allowing the Soviet Union to broker a peace settlement at Tashkent between the two combatants. This was the final act in a policy which in a single decade had totally failed: instead of being deterred from penetrating South Asia, both the Soviet Union and China had experienced an enormous increase in their influence by taking advantage of the intra-regional cleavages which US policy had intensified. Pakistan had turned toward China. It was really from this point on that Indira Gandhi determinedly turned toward the Soviet Union as India's arms supplier and toward trying to transform the Indian government into a Soviet-style command state.¹⁵ In short, instead of politically stabilising south Asia, American policy had made war and threats of war between India and Pakistan a permanent state of affairs in the subcontinent. McMahon has stated it well:

In so many respects, the Indo-Pakistani war of 1965 stands as a watershed in the history of American relations with the Indian subcontinent... Johnson and his chief policy advisors recognised the obvious: that the war signalled the frustrating end to a policy cycle set in motion with the formation of the Pakistani-American alliance... now, those illusions lay shattered along with peace in the subcontinent... An investment that totalled nearly \$12 billion... had produced amazingly little support or understanding for the United States in either country.¹⁶

Yet, amazingly, failure did not lead to any significant alteration in the basic policy. The subcultural parameters of the policy continued to drive it and continue to this day to drive it. The Nixon administration, in fact, revitalised the Pakistan relationship not because Pakistan had seen the 'error of its ways' but on the contrary because the ties

it had developed with China out of disillusionment with the American connection suddenly proved to be useful for a new cold war strategy devised by Henry Kissinger. This, of course, was his initiative to 'open' China and normalise relations with her as a means of exploiting the cleavage between China and the Soviet Union. Kissinger wished to use Pakistan as the conduit for his secret mission to Beijing to pave the way for president Nixon's state visit to China in 1972. Between these two events, however, the Bangladesh insurrection occurred which led to war between India and Pakistan for the third time. Once again the cold war subculture combined with Nixon's personal enmity towards the Nehrus to determine United States south Asian policy. The US first decided to look the other way concerning west Pakistani genocide towards the Bangladeshis and then to more openly and blatantly take sides in the conflict than America ever had done in previous Indo-Pakistan confrontations. This 'tilt' even included gunboat diplomacy, as the carrier Enterprise moved into the Bay of Bengal for the obvious purpose of trying to intimidate India into limiting its military operations in Bangladesh. It was clearly the *quid pro quo* for the Pakistani government's co-operation in the China initiative. Regional social realities as always took a back seat to the global ideological imperative. As Kux has correctly stated it:

The US role during the crisis is reasonably clear; the rationale for the Nixon-Kissinger policy has remained less clear. Part of the difficulty has been that the President and Kissinger perceived the crisis almost entirely in terms of its global implications – as they interpreted these – and the US government's South Asia hands and most other observers considered the crisis as a regional affair with limited broader implications.¹⁷

The pattern of cold war-driven oscillation continued through the Ford, Carter and Reagan administrations. The precipitant would change but the theme always remained the same: relations between India and the US would backslide at each point where events in or pertaining to south Asia imparted differentially on the two countries in such a fashion as to impel the US to apply cold war subcultural standards to the policies it adopted. During the Ford administration the abrasive issue was Indira Gandhi's emergency, her desperate attempt to politically save herself by the literal imposition of a Soviet-style state upon an India, one might say, constitutionally antithetical to such a high order of authoritarianism. And even though the US was in this instance morally correct in condemning the emergency, some of the reasons why Gandhi's regime had slid this far toward authoritarianism, and pursuit of the nuclear option (as of 1974), are traceable

to a very great extent to cold war-driven measures pursued by Ford's immediate predecessors which had led India not only toward excessive military and economic dependence on the Soviet Union but also toward attraction to her political institutions as well.¹⁸

Thornton summed up this period very aptly:

When the Republicans handed the presidency over to Jimmy Carter in 1977, they left US-Indian relations in much the same shape that they had found them. On the negative side, there had been an experience that, for the Indians at least, had generated lasting bitterness and taken off what little bloom still existed in US-Indian ties. On the positive side, the much-touted maturity of the relationship was a significant gain. Neither expected too much from the other and would thus not be very disappointed or disillusioned as the relationship encountered problems and difficulties.¹⁹

In the Carter administration the new irritants were Tarapur and Afghanistan. The former pertained to a licence India applied for in 1977 to import 7.63 tons of low enriched uranium fuel to sustain operation of its Tarapur nuclear reactors. In ambassador Goheen's words, "The action was in accord with the thirty-year US contractual obligation to be the sole supplier, and it was well within the schedule for resupply that had been agreed upon."²⁰ But as US Congress threw a monkey wrench into the sanctity of this contract with the passage of the Nuclear Non-Proliferation Act of 1978 (NNPA) which ordained that existing bilateral contracts were to be nullified if they could not be renegotiated to conform to the stringent restrictions on reprocessing laid down in the bill. Resolution was finally achieved early in the Reagan administration by allowing the French to supply India with the needed nuclear fuel, but only after the foundation had been laid for mounting disagreement and tension between the two countries over nuclear proliferation issues.

The Soviet invasion of Afghanistan in late 1979 was, of course, the principal new source of mutual pique as the Carter administration drew to a close. India's refusal to take a knee-jerk pro-western stance on this event and Washington's knee-jerk rush to restore the arms relationship with Pakistan ignited the full cycle of cold war-driven rancour between the two countries. Indira Gandhi's return to power in the seventh general election of 1980 crystallised the newly emergent gulf. Reagan's electoral victory in the US brought to power a regime that was determined to fight the fiscal and symbolic equivalent of a third world war under the rubric of the cold war subculture, through massive defence spending, extremist rhetoric (e.g. the "evil empire" theme), operatic military adventures like Grenada, and

employing Afghanistan, somewhat analogously to the way the fascists and communists employed Spain in the 1930s, as a major surrogate battlefield.

Interestingly, while the usual piquish exchanges occurred during the early stages of the Afghan war, as it dragged on, a relative quiescence settled over US-Indian relations. In part this may have been due to the intractability of the conflict. But in part, it had to do with a leadership and correlative attitude change in New Delhi. After Indira Gandhi's assassination in 1984 and Rajiv's assumption of the prime ministership, a new atmosphere of expectation arose, because in the initial flush Rajiv, with his Doon School image, boardroom political style, and apparent amenability to economic liberalisation, gave heart to American cold warriors and global entrepreneurs that India might at last be inclining toward the west. This was reflected in senator Orrin Hatch's up-beat senate speech on May 19, 1983, in which he declared: "I believe a historic shift is underway", which heralds the "end of an Ice Age", which has perpetuated "cool relations between the United States and India for many years".²¹

POST-COLD WAR OPPORTUNITIES AVAILABLE TO THE CLINTON ADMINISTRATION

Even though Rajiv Gandhi suffered assassination in his turn in 1991, the last part of the Reagan-Bush era presented the incoming Clinton administration with a remarkable opportunity to make a fresh beginning in US relations with both major powers in the subcontinent.

(1) P V Narasimha Rao, the successor prime minister was a senior, centrist Congress Party politician with considerable foreign policy experience (having been Indira Gandhi's minister for external affairs from 1980 to 1984) who was determined to push ahead with economic liberalisation at home and reshape Indian diplomacy abroad to conform to this mandate. Helping the Indian economic sleeping giant to awaken and connect itself with the global economy were the substantial, dynamic overseas Indian communities, especially in the US and Great Britain, who could bridge crucial entrepreneurial, political and communication gaps between India's domestic political economy and those of their chosen second countries.

(2) The cold war had ended on president Bush's watch with the Soviet Union's collapse. This had relieved both parties of burdensome diplomatic baggage: the US of any empirical basis for continuing the anti-communist obsessions which had plagued its south Asia policy for four decades, and India of its economic dependence on, and political subservience to the Soviet Union,

and its equal and opposite obsessive need to recite the mantras of orthodox non-alignment whenever disparities between behaviour and principle backed it into embarrassing diplomatic corners. This structural change was a critical factor in providing both sides with a greater measure of manoeuvrability in the post-cold war world that was dawning.

(3) The Pressler amendment to the foreign operations bill in 1985 (that denied military and economic assistance to Pakistan unless the President could certify that Pakistan was not attempting to produce nuclear weapons), plus the end of the Afghan war, had at last given the US leadership an opportunity to remove the Pakistani tar baby from its back. No longer need the US be as vulnerable to the Pakistan lobby which had for so long adroitly exploited the cold war subculture through coalitions they built reaching across Capitol Hill, the State Department, the Pentagon, the defence industry, and segments of the scholarly community.

Sadly, however, this new opportunity has thus far not been imaginatively seized upon. The ideological, intellectual and material encumbrances of the cold war subculture have proved far more intractable than many hoped. Repeatedly, in response to them, the Clinton administration has made decisions which threaten to preserve the existence of the Pakistani tar baby and allow it to continue holding America's south Asian policy hostage to its obsolete political assumptions. Helping this process, of course, has been the rise of Islamic militancy not only in west Asia but in central Asia as well, with attendant fears that the cries of their leaders for holy wars against Israel and the US will soon acquire nuclear muscle. In some quarters, such fears have already replaced the Red Peril as the successor global obsession. There is danger, of course, in not being cognisant of possible threats to American, indeed world, security in such developments, but greater danger in allowing them to become, as happened during the cold war, such pervasive concerns that mitigating regional socio-cultural realities are left out of policy formulations.

Signs that this has become the case with the Clinton administration and sections of the US Congress abound. Perhaps the initial manifestation occurred with the appointment of an assistant secretary of state for south Asia who despite having a Pakistani political axe to grind was nevertheless given the position because of her personal ties to the Clintons. Almost immediately she sent US-Indian relations careening backward into the arms of the cold war subculture by declaring in an October 28, 1993, background briefing that the US considers Kashmir a "disputed territory" and does not, consequently, recognise "the Instrument of Accession as

meaning that Kashmir is for evermore an integral part of India". This exchange arose from president Clinton's having earlier mentioned the Kashmir dispute in a speech, no doubt at the behest of the assistant secretary of state which, of course, gave the impression that policy changes were being contemplated. The reverberations this instinctively pro-Pakistan statement set off in India still have not abated despite numerous attempts by subsequent US government spokesmen to reassure New Delhi that no contemplated policy changes lie behind the remark. It did not help, of course, when the assistant secretary's own reaction to Indian official and press criticism was to dismiss them with the patronising remark that "it's very easy to create a storm in Delhi. Delhi enjoys storms".

More serious problems have followed. Congress and the White House, sometimes separately, sometimes in concert, have seemingly taken turns in adopting public positions and policies which perpetuate the rancorous atmosphere of the cold war long after any material gains from doing so can be anticipated.

The most egregious of these misguided undertakings has been the alliance between the White House and the Republican-dominated US Congress. The purpose has been to undermine the Pressler amendment, thus permitting a resumption of arms shipments to Pakistan despite that country's unwillingness to forgo its pursuit of the nuclear option. The struggle on Capitol Hill between opponents and proponents of the so-called Brown amendment (no 2078) to the FY 1995 foreign operations bill has generated one of the most intense struggles over the future direction of US south Asia policy in years. And the pity is that its success has soured relations between India and the US once again with no palpable gains to long range American interests to be foreseen from doing so.

Both the invited expert testimony before Congressional committees and the content of the floor debate in the Senate revived all the tired rationalisations and regional cultural and historical ignorance that had been employed by administration and congressional advocates of the Pakistan connection during the cold war.

Technically, the issue was not the complete abandonment of the Pressler amendment and the permanent restoration of arms assistance to Pakistan. Somehow it had become the cause celebre of retiring Senator Hank Brown of Colorado to become the man of destiny and lead an effort to obtain what for Pakistan was termed a "one-time exemption" from the Pressler amendment. This despite the fact that Pakistan's leaders had repeatedly thumbed their nose at every effort the US government had made to get

the Pakistanis to promise to stop trying to manufacture nuclear weapons. Even direct talks between president Clinton and Benazir Bhutto during her orchestrated state visit to the US (I say orchestrated because its purpose was to help lay the groundwork for the lifting of the Pressler amendment) in April 1995 failed to gain such assurances. The rationale put forward by the White House and Senator Brown for this anachronistic initiative was two-fold: on the one hand, it was justified on the grounds of "fairness"; on the other, on the grounds of "leverage".

The "fairness" issue arose from the fact that Pakistan had bought and paid for 28 F-16s manufactured by Lockheed which then could not be delivered because the president could not certify that Pakistan was not trying to produce nuclear weapons. In other words, Pakistan's intransigence had brought the prohibition down upon itself. Despite this fact, however, the reasoning went that since Lockheed refused to refund the money which Pakistan paid for the undelivered aircraft, "fairness" demanded not that Congress simply appropriate the money Pakistan lost in the transaction but that they be compensated by receiving a laundry list of alternative weaponry worth \$368 million which would allegedly increase her defensive capabilities without "upsetting" the balance of power between her and India. The list included M198 howitzers, Harpoon missiles, three P-3 Orion aircraft, and a horde of components and spare parts.

The "leverage" issue revolved around the administration's claim that showing magnanimity and flexibility toward Islamabad in this way would avoid "alienating" them further than they allegedly already were and thus make them more amenable to political persuasion regarding non-proliferation, collusion with China, and radical Islamic states like Iran, provocation in Kashmir, and suppressing the drug trade without restoring the arms relationship with Pakistan and through this alienate India and jeopardise peace in the subcontinent were rejected out of hand by the Capitol Hill and administration proponents of the Brown amendment. A parade of academic and think tank experts were paraded before the Senate foreign relations subcommittee to confer intellectual legitimacy on the initiative. Care was taken to call only witnesses who were in agreement. Dissenters were not welcome! The secretary of defence sent in testimony, as did the assistant secretary of state for south Asia. The American ambassador to India, himself a former defence department functionary, weighed in on the pro-Pakistani side through public statements and private representations. Their principal role was to assure doubters that the arms provided to Pakistan under the one-time exemption would not upset the military balance between

India and Pakistan, despite protestations to the contrary by India, by numerous south Asia specialists, and by many members of Congress themselves who possessed more than a cursory understanding of South Asian political, historical and social realities. These latter included Senators Diane Feinstein, John Glenn, Paul Simon, and John Kerry. When Congressional opposition, mobilised by Senator Feinstein, almost turned the tide against the Brown amendment at the last minute, an *India Abroad* story (November 10, 1995) revealed that the move (in the form of an amendment put forward by representative Joe Knollenberg of Michigan that would limit the package to economic aid alone) was stymied by a letter to senator Brown from Joseph Nye, Jr. "a senior Pentagon official". Ostensibly, it succeeded because it effectively reassured the legislators that the arms package would not militarily destabilise south Asia but probably was decisive in actuality because it made clear that the entire weight of the White House, the state department and the defence department were implacably behind the Brown amendment.

It is this latter fact that makes it clear that the adoption of Brown by the House-Senate conference committee on October 24, 1985, as a one-time exception to the Pressler amendment, was in reality the opening salvo by a diverse coalition of interest whose purpose, pious denials to the contrary notwithstanding, was to desanctify the Pressler amendment so that eventually it will prove possible to sweep it aside completely and restore in some form the essence of the old cold war relationship with Pakistan, only this time with a nuclear edge to it since Pakistan has shown not one scintilla of willingness to discontinue its quest for a nuclear capability. In fact, since the passage of the Brown amendment there have been revelations of new transfers of nuclear technology to Pakistan from China, probably with tacit US approval despite public protestations to the contrary.

The question then is who are these retrograde interests and what do they stand to gain from setting back the clock in south Asia at a time when the forces of progressive change are blowing so briskly there? A corollary question is can they really succeed in the long run especially given the new economic forces that are indeed at work there?

The defence industry is certainly a significant player in the anti-Pressler scenario. Pakistan has not necessarily been the most lucrative source of American arms sales in recent years, but thanks to the Pakistan alliance, despite its many ups and downs, and despite the ultimate political failure of the policy, it has remained a steady source of weapon purchases for certain arms

suppliers, most particularly companies like Lockheed with economic tentacles in many congressional constituencies including, now that it has merged with Martin Marietta, Hank Brown's home state of Colorado where it is the largest single defence employer.

There are a considerable number of legislators on Capitol Hill who derive substantial financial gains from keeping the cold war subculture alive in south Asia. The manner in which some do so is itself a reflection of the dramatic increase in the size, diversity and economic clout of the south Asian population resident in the US. Essentially, they profit from India bashing. In exchange for campaign contributions they champion such causes as Khalistan and Kashmir by promoting legislation and resolutions in Congress and by using their political status outside Congress to demonise India. They are an automatic voting bloc for undertakings like the Brown amendment. There are at least 35 members of the House of Representatives who fit this category, most are Republicans but some are Democrats. Senator Jesse Helms, now chairman of the Senate foreign relations committee, has consorted with pro-Khalistan lobbyists since the early 1980s commencing with the notorious Jagjit Singh Chauhan and Gurmit Singh Aulakh (president of the Washington-based Council of Khalistan). Perhaps the archetypical example of this genre of congressman today is representative Dan Burton of Indiana whose speeches and statements in the House persistently vilify India using totally biased information about human rights violations supplied to him by his pro-Khalistani benefactors. In exchange for rendering this service, Sikhs donated 34 per cent of his reported campaign contributions in 1993 (\$18,940 of \$55,255). In 1991 and 1992, \$61,076 came from 146 Sikh contributors from all over the US while 202 Indiana residents had donated \$96,025.

In fairness, there is also an 'India caucus' on Capitol Hill, mostly Democrats, many of whom are from constituencies in states like New Jersey and New York where there are fairly substantial numbers of Indians. But this group has so far failed to match their anti-Indian counterpart in effectiveness, no doubt in part because Democrats no longer control Congress and because the Clinton administration has shown greater interest in placating Pakistan and Pakistani interests than in taking the initiatives that would once and for all remove the Pakistani *taibah* from the back of American foreign policy.

Among the players in today's south Asian drama, the Clinton administration's motives are the least easy to fathom and must be attributed in great measure to simple naivete leavened by the poor guidance they are receiving from trusted advisors. Clearly, as the Brown amendment debate revealed, there

remain potent pro-Pakistan lobbies in both the state and defence departments despite the end of the cold war and the utter failure of the Pakistan alliance which it spawned. These lobbies certainly retain ready access to the White House, especially where Clinton's own choice for assistant secretary for south Asia has strong affinities to Pakistan. In addition, the Pakistanis themselves maintain very active lobbying efforts in Washington, as indeed they always have, which mesh well with the long-standing congressional, Pentagon and defence industry interests spawned by the cold war. Indian lobbying has always been less effective both because the government of India invests less resources in it (though admittedly it has vastly improved in recent years) and because India, with its non-alignment policy, its socialist economy, and its tilt toward the communist bloc, was less sympathetic in establishment eyes, and in any event had less material to whet material appetites with on this side of the globe.

Yet in some respects the Clinton administration has adopted very positive orientations toward India, obviously in an attempt to try and appear "even handed". This too, of course, is an old story in American south Asian policy. Our global preoccupations have perennially driven us to favour the Pakistan relationship at the expense of the Indian; our concern for the intra-regional tensions which our global policies have created have driven us in turn to search for ways to placate India, to keep them on the string, as it were, usually at the cost of irritating Pakistan. We have tried to have our cake and eat it too in south Asia by trying to maintain two separate and incompatible foreign policies toward the subcontinent's two principal states. Dual bilateralism has not worked well at the intra-regional level because it has counter-productively enmeshed us in the region's grass roots political conflicts.

Our encouragement of India's economic liberalisation while at the same time we coddle our Pakistani *taibah* by winking at their quest for nuclear weapons, undermining the one instrument that deters that quest, and shipping them more arms that destabilise the region is the latest case in point. Visits to India by Ron Brown and other administration officials in its behalf have clearly helped open doors which are accelerating India's entry into the global market-place. The First Lady's visit to India was a significant symbolic gesture, tainted somewhat by a side trip to Pakistan whose purpose was to pave the way for Benazir Bhutto's trek to Washington to help catalyse the Brown amendment.

But succumbing to the various parochial interests that profit from a perpetuation of the cold war subculture weakens America's

chances to help cultivate peace, prosperity and political stability in south Asia. A change in strategy benefits Pakistan as much or more than it does India. Pakistan does not need more weapon systems for its military machine. It needs economic liberalisation, and capital infusions through access to the global economy. It needs rapid economic development. It needs social reform that addresses the concentration of the country's wealth in the hands of a narrowly circumscribed Punjabi landed, bureaucratic and military elite whose political survival depends upon the control of the military machine which American south Asia policy has helped to perpetuate for the past 40 years. It needs to get over its obsession with India (a product of the separatist movement) and settle its differences with India, especially Kashmir, which can only be done if the Pakistani leadership is no longer encouraged to believe that alliance with the US enables it to avoid direct and realistic negotiations with India.

Finally, it is tantalising to think that in the end US relations with India, if not with Pakistan, may resolve themselves in pragmatic terms, at least. By this I mean that economic liberalisation, the growing influence of the overseas Indian community on both governments, and the massive flow of American corporate investment capital into India may soon reach that critical mass where political bickering simply becomes moot. We saw last year, and once again this year, how irrelevant China's human rights record has become to president Clinton's decision on whether or not to revoke China's MFN status. The lobbying clout of that segment of the corporate community which has invested massively in the Chinese economy and is poised to plunge even deeper into the China market has repeatedly forced the Clinton administration to disaggregate trade from human rights. A similar scenario is emerging in south Asia *vis-a-vis* US-Indian relations. If the "India market" continues to ramify as massively as the China market has done, the point may not be far distant when the Pakistan lobby and the cold war culture which impelled Congress and the administration to move backward in time with the Brown amendment, will be unable to consummate their contemplated ultimate goal of permanently nullifying the Pressler amendment. If restoring cold war policies in south Asia appear to start seriously threatening the region with war and nuclear destruction, politically mobilised corporate self-interest may compel the Clinton administration and its hawkish supporters on the Hill to do what so far they have proved too unenlightened to do otherwise: viz, shear American south Asia policy once and for all of the Pakistani tar baby and concentrate on the creation of post-cold war policies which

bring peace, prosperity and political sanity to the region.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Maxi Devaluations and Cooper's Hypothesis

Ravindra H Dholakia

IN a recent paper, Pronab Sen has defended Cooper's contractionary devaluation hypothesis in a very interesting and lucid way ('Cooper's Contractionary Devaluation Hypothesis: A Note', *EPW*, July 27). In the true spirit of macro modelling, he has effectively demonstrated the validity of Cooper's hypothesis with important modifications through the six propositions derived from a simplified macro model. His most important proposition is his Result 4 which states that gross complementarity of home goods and imports in the domestic consumption is the necessary condition for the devaluation to be contractionary. Since it is a distinct (and maybe most likely) possibility to find gross complementarity between the home goods and imports in the domestic consumption in several developing countries, Sen concludes "that 'maxi' devaluations do not always need to be accompanied by contractionary fiscal and monetary policies". Something more is needed to arrive at this conclusion than what is contained in Sen's note.

For Sen's policy conclusion to hold, it is necessary to examine the conditions under which the home goods and the imports would remain gross complements throughout the whole range of the exchange rates. Sen does recognise that in a two-commodity world the two goods have to be net substitutes (he calls them Hicks-Allen substitutes). The two goods can become gross complements only when their direct price elasticities are numerically less than unity.¹ This is derived from the well known relationship between the price consumption curve (PCC) and the elasticity of demand. The Figure shows this relationship with a normal U-shaped PCC for imports. The price of imports is taken as the exchange rate 'e' consistent with Sen's framework. As it can be readily seen, on the downward sloping portion of the PCC, the home goods and imports are gross substitutes when the demand for imports also turns out to be price elastic. It is only on the upward sloping part of the PCC when the import demand is price inelastic that the home goods and imports become gross complements. In the Figure, line AE_0 is the price line having the slope of e_0 exchange rate. Similarly, lines AE_1 and AE_2 have the slopes e_1 and e_2 respectively where $e_0 < e_1 < e_2$. If E_0 is the initial point of equilibrium, Sen's analysis shows that any devaluation from e_0 to e_2 can admit a possibility of contractionary effects on the economy. But 'maxi' devaluation is not necessarily restricted only to this range. On the contrary,

the concept of maxi devaluation is to ensure that the minimum devaluation required is of the order of e_0 to e_2 . It could be more but not less. With any devaluation leading to the exchange rate in excess of e_2 , the home goods and imports would turn out to be gross substitutes foreclosing all possibilities of contractionary devaluation as per Sen's analysis. Hence Sen's above-stated conclusion does not hold particularly for the maxi devaluations recommended by the Fund and the Bank.

For Sen's conclusion to hold, however, it is necessary to impose further constraints on the nature of the preference function between the home goods and the imports so that throughout the whole range, the two goods turn out to be gross complements. This requires the PCC to be upward sloping throughout. This can happen only if the possibilities of substitution between the home goods and imports in consumption are limited and not existent beyond a point. In short, we must consider a nation which cannot exist without imports. For such a nation, it is natural to expect a highly inelastic demand

for imports throughout the range. This is the case of abnormal demand conditions in relation to the standard Marshallian conditions of normal demand requiring elastic demand at relatively high prices and inelastic demand at relatively low prices [Allen 1986:257-60]. Sen has not explicitly stated the assumption about such abnormal demand conditions prevailing in the nation. Without this condition being explicitly stated in his model, his strong conclusion about the maxi devaluation is not justified. Such abnormal demand conditions for imports are, however, not entirely unrealistic. They may very closely approximate the reality in small island nations. But for several developing countries, say in Africa or Asia or Latin America, these conditions may not be considered very realistic. In all such cases, Sen's conclusion about maxi devaluations would not hold because at high enough devaluation, the possibility of contraction would simply be foreclosed making the demand for imports price elastic. In the case of small island nations where the condition for abnormal import demand is likely to prevail, the very concept of 'maxi' devaluation is not well defined, and even devaluation *per se* may be ill-advised unless exports are highly price sensitive.²

FIGURE

How do we accommodate this aspect in Sen's model? Only by specifying the home consumption (HC, to use Sen's notation) function appropriately. If rigidities in preferences have to be incorporated to obtain gross complementarity or gross substitutability between the two commodities throughout the range, the import demand function has to show price elasticity of demand for imports which is either constant or showing contrary to normal behaviour with respect to the exchange rate. Under both these circumstances, the import demand function has to be non-linear in c . On the other hand, a generalised specification of the import demand function should allow for the normal behaviour of the price elasticity which can be done through a linear function in c . It is possible to make a choice between these two alternative forms of the demand functions with the help of well established econometric tests.

However, at this stage, it may be pointed out that the set of data available on exchange rates, imports and import prices for most of the developing countries are likely to have some inherent bias arising out of the initial position of inelastic imports with comfortable forex situation. By experience or the 'gut feelings' of the policy-makers, if it is well accepted in a nation that their imports are price inelastic and that devaluation in a narrow range may be contractionary, the most preferred policy would be to revalue the currency in real terms if not in nominal terms. Thus, most of the developing nations were fond of holding their nominal exchange rate fixed irrespective of large positive differences in their inflation rates over those of their major trading partners. This made their real effective exchange rates appreciate considerably. This might have been perceived very beneficial because if devaluations were indeed contractionary, the revaluations would be expansionary by the same logic. However, this situation is obviously not sustainable in the long run when growing trade deficits resulting from the policy of revaluation make the currency so overvalued as to pose a major threat to the monetary and fiscal stability of the system.¹ Sen's analysis of Cooper's hypothesis helps us understand better the rationale for the policy of tacit effective revaluation followed by several developing nations. However, his conclusion that the 'maxi' devaluations may be contractionary, does not come out of his model unless abnormal demand and supply conditions are explicitly considered.

Notes

¹ It is important to note that the two goods can be uniquely defined as gross complements only when both the cross price elasticities are negative. This may not always occur [for details see Dholakia and Oza 1996 (45n)]. On the other hand, Sen unnecessarily recommends

that the cross price elasticity obtained from the econometric estimation of the import demand function can serve the purpose for testing gross complementarity! Cross price elasticity in the import demand function is the partial percentage change in the import demand with respect to the price of the home goods, while Sen's model requires the estimate of the other cross price elasticity, viz, the partial percentage change in the demand for home goods with respect to the exchange rate.

² The aspect of the elasticity of export supply is assumed away by Sen for simplicity and expositional convenience. His conclusion on 'Maxi' devaluation would, however, require this aspect also to be explicitly considered.

Thus, it is not only the import demand function but also the export supply function which needs to be estimated.

³ It may be pointed out here that several developing countries had highly overvalued currencies before implementing the 'conditionalities', the rate of overvaluation often being in three digits and sometimes even in four digits (e.g., Ghana and Uganda)!

Homosexuality: Against Hubris

A Suneetha

H SRIKANTH's (*EPW*, April 13) rejoinder to Vimal Balasubrahmanyam (*EPW*, February 3) raises a host of issues related to human sexuality, right to sexual orientation, as well as civil and human rights, which need careful consideration. The attempt made here does not claim to address all the issues and aims only at contesting the various premises on which Srikanth's article is based and outlining its implications for the democratic spirit that underlies the civil liberties movement(s) in India.

Reacting to VB's advocacy of the rights of the homosexuals in India and her criticism of the unsympathetic attitude of the Left towards their rights, Srikanth says that every expression of sexuality should be evaluated on the basis of the larger needs of the society for reproduction and as homosexuality in no way contributes to be healthy reproduction of the society, it should be rejected. Consequently, it should not be viewed as a civil liberties issue but as a problem of medical health. Moreover, these persons who give exaggerated importance to their sexual needs rather than to the emancipation of our society are asking for privileges and should be discouraged so as to protect our healthy reproductive practices.

The first premise of the article is that of heterosexual behaviour as the only normal sexual behaviour. With this premise Srikanth sets out to examine the reasons for the existence of homosexuality. Defining homosexuals as persons who deviate from the practice of "normal" sexuality due to "biological imbalances" or the lack of "access to healthy heterosexual relations for a long time", or due to the rigidity of the gender categories, he claims that they can be cured of this practice through education, counselling or medical treatment. It can only be a substitute for heterosexual relationships when the latter are not available, but should be discarded as soon as they do become available.

Secondly, he argues that all sexual practices should be guided by the larger needs of the society, i.e., the stage of social development. It is the social necessity, i.e., reproduction of the species that determines the sexual relations in a society and any expression of sexuality outside the strict needs of reproduction is perverse or "deviant". According to this argument human society has left all the undesirable sexual practices such as polygamy, incest, polyandry as backward and unsuited to its social organisation and has decided on monogamous sexual relations, i.e., heterosexual relations within marriage, as the only desirable practice. As such, any support to homosexuality amounts to giving support to such archaic practices as "caste, sati, incest". Apart from the persons who are biologically not suited to heterosexuality, persons who choose homosexuality by choice are "perverts" and pose a great danger to the "normal" monogamous practices, by not centring their sexual behaviour round reproduction.

Consequently, civil libertarians and Marxists who are politically progressive should make efforts to "correct" them. Supporting their claims for rights would amount to legitimising their sexual orientation. Marxists, who should judge everything from the systematic point of view, should treat such practices as harmful to the society and if need arises should not hesitate to use force against them.

I would argue that the 'normality' of the heterosexual practices is a highly constructed one and even granting the 'abnormality' of homosexual practice, they do not deserve the treatment that Srikanth has in store for them. Second, I would argue that the link between sexuality and reproduction is a problematic one. Third, it is pointed out that arguing against homosexuality on the grounds of 'progress' is an absolutely authoritarian.

CONSTRUCTION OF 'NORMAL' SEXUALITY

The belief that heterosexual behaviour is natural to human beings equates biological sex with the gender of human beings. The role of culture in the making of 'women' and 'men' out of female and male beings is hardly acknowledged. Gender socialisation which starts in infancy continues in all spheres of life and structures the lives of women and men to suit the roles the society has carved out for them. The categories 'men' and 'women' are defined as excluding each other. Their 'biologically' defined gender identities largely determine the expression of sexualities of men and women. The single most important aspect of this gender construction is the subordination of females to males. This subordination is eroticised in many to 'naturalise' as well as 'normalise' the heterosexual behaviour. Women and men are allowed and encouraged to express heterosexual impulses only. Thus among various cultures, the stronger the gender differentiation, the more the structures against homosexuality will be.

The definition and construction of sexuality and sexual behaviour is a major component in the subordination of women to men in all patriarchal cultures. It is this linkage between heterosexuality and women's subordination that the radical feminists have pointed out. The choice of lesbianism as a political weapon has to be understood in this context. Though the merits of this choice are open to debate what it makes clear is the oppressive nature of compulsive heterosexuality. Rather than concluding that homosexuality arises due to the inequalities that exist in the heterosexual relationships today as Srikanth argues, they have pointed out that the privileging of heterosexual behaviour plays a major role in obstructing the political bonding among women. Moreover, the separation of homosexuals as a separate category of persons has occurred in the context where capitalism was taking roots, and when the family became an important structural component of emerging capitalist relations. Heterosexual family became the basic unit on which capitalist relations were shaped. Marxist-feminists in the west have extensively analysed these relations between patriarchy and capitalism in the west. Heterosexual relations and the organisation of these relations into families is needed by capitalism for the reproduction of labour power. Similarly, patriarchal subordination of women in families is also necessary to keep the value of women's labour-power low, to use women as a reserve labour force. The rigid boundaries between masculinity and femininity are thus constantly constructed, maintained, naturalised and re-inforced and only heterosexuality comes to

be considered as 'normal' sexual behaviour. Thus, the concept of homosexual is a relatively recent idea, only hundred years old. As Anthony Giddens points out, "only in the last hundred years has homosexual activity been considered something that a certain type of person does – a category of abnormality and deviance constructed in opposition to the category of the 'normal heterosexuality' [Giddens 1989, emphasis added].

Various myths that support this 'deviance' are constructed. The most popular myths are that homosexuals are more sexual, that homosexuals desire to the members of the opposite sex, that a person is either a homosexual or a heterosexual and most potently that homosexuals as a group are psychologically maladjusted, the last of which Srikanth also expresses. Mark Freedman, who has done a comprehensive study on the psychological dimension of homosexual and heterosexual women says "(T)here are no significant differences in rated psychological adjustment between the groups of homosexually oriented and heterosexually oriented women...Nor were the homosexually oriented women any more neurotic or variable in their psychological functioning than the heterosexually oriented control-group members...the homosexually oriented women were functioning significantly better psychologically in many areas..." [Petras 1978].

Any discussion of sexuality that intends to propose a unitary mode of 'sexual coexistence' cannot afford to ignore this 'constructedness' of 'monogamousness' of the existing heterosexual relations. And it is in this context that any discussion on homosexuality should be firmly placed.

That the organisation of sexuality into oppressive heterosexual families is neither of historically immutable reality nor a desirable one is brought home by the protests of persons with homosexual orientation throughout the world today. Homosexuals, gay and lesbian challenge the boundaries imposed by patriarchal social structures on the sexuality of both men and women. By exploring and expressing alternate forms of sexuality that have always been integral part of 'normal', but suppressed human sexuality, they 'normalise' the relationship among men and women.

RELATION BETWEEN REPRODUCTION AND SEXUAL ACTIVITY

Apart from the extremely limited conception of sexuality what is more troubling is the authoritarian tone this article adopts towards expression of sexuality in the mask of 'progressivism'. It assumes that men and women should exercise their sexuality only in the interests of procreation and that it should be according to the needs of the

society, i.e. procreancy (expressed by Srikanth as reproduction). That this 'necessary' relationship posited between sexuality and procreancy is neither necessary nor desirable as such became evident in the course of human history.

Srikanth seems to fear that the society might not be able to reproduce itself if homosexual relationships become dominant. This is implicit in his accusation of Vimal Balasubramanyam that she wants to encourage these practices by advocating homosexual's rights to sexual orientation. Apart from the ill-founded nature of such fear it is his understanding of reproduction which is more troubling.

Homosexual practices always coexisted with heterosexual practices in most cultures and they never hindered the process of biological reproduction. In fact evidence points out that tribes resorted to homosexuality as a measure of population control. There exist some tribes in which homosexuality is institutionalised and coexists with institutionalised heterosexuality.

Coming to reproduction, Srikanth seems to assume that it happens automatically and naturally, with the willing co-operation of women and men in the process of procreation. This unproblematic assumption does not acknowledge the oppression of women that is a constitutive element in the process of human reproduction. Reproduction involves both biological reproduction (child-bearing, that is, biologically done by women) as well as human reproduction (i.e. child-rearing, which has been historically done by women but is not 'natural' in the sense of being 'biological'). The reproductive power of women has been historically controlled by men in all patriarchal cultures. It is only in recent times that women have been partially freed from this control due to technological advances in contraception and gained relative autonomy in the exercise of their sexuality. Though this has not given them total autonomy, nevertheless the loosening of the link between reproduction and sexuality constitutes a progressive step for women. This recognised autonomy in fact paved the way for the development of individualistic behaviour and tolerant attitude towards homosexual behaviour too. It would be counterproductive to reimpose this value at this stage of technological development where human beings have moved out of the realm of necessity of the linkage between sexuality and procreation, especially for women.

Similarly, the positing of a societal mode of proper sexual orientation on the assumption that sexuality should be exercised according to the reproductive needs of the society depending upon the stage of development of the human societies can be dangerous in other ways. Religious insti-

tutions apart, since their inception, states have always sought to control the sexuality of women, and in the state-centered societies of many ex colonial countries Asia and Africa it was amounted to go giving control on women's sexuality (also of men belonging to lower socio-economic categories) and reproduction to the dominant interests in the society. The disastrous consequences for women which resulted due to the population policies adopted by many governments in these countries are only too well known.

What is pointed out here is that just when both some women and men are able to break out of the boundaries that patriarchy imposes on the expression of their sexuality as a result of multifarious struggles on all its aspects exposing its various pretensions regarding sexuality and reproduction, it would be reactionary to put the clock back to assume the same pretensions in the name of progress. Srikanth's notion of progress is a linear one that ignores important historical realities. Without taking into consideration the complexities involved in sexuality of women and men it would be irresponsible and frivolous to argue against homosexuality on the grounds of backwardness and abnormality.

IS RIGHT TO FREEDOM OF SEXUAL ORIENTATION A BOURGEOIS PRIVILEGE?

As pointed above homosexuality has existed in all cultures and has even been institutionalised in some. Its acceptance and tolerance depended not on societal needs for procreation but on the extent of gender differentiation and acceptance of various various modes of sexual behaviour as part of normal human sexual behaviour. When Vimal Subrahmanyam argues for the rights of the homosexuals what she is pleading for is this acceptance of sexual relations between persons of same sex as normal. A human deprivation is expressed in the language of rights only when it is not recognised as such and is aimed at the removal of such deprivation. When homosexuals protest on the streets what they are fighting for is not that all the heterosexuals should turn into homosexuals but that their sexual orientation should not form the basis for discrimination and deprivation of their rights. They demand that homosexuality be accepted as normal. They demand that a person's sexual orientation be considered a private matter of that individual, a private matter of purely personal choice that does not have any bearing on the other aspects of their lives. Just as a person's heterosexual orientation 'privileges' them to go about life unhindered, a person with homosexual orientation should also be able to live her/his life.

Though Srikanth's arguments against the rights of homosexuals on the grounds that

it is an imported practice of the decadent bourgeoisie and that it is non-existent among 'working' classes can be easily dismissed as flimsy, his later argument that they do not contribute to social emancipation needs a thorough rebuttal. Apart from the puritanical attitude towards sexual behaviour implicit in this argument what is more problematic is the role he visualises for civil liberties organisations. Admitting that homosexuals should not be deprived of their rights which are constitutionally guaranteed, he says that civil liberties organisations can take up this task but questions VB as to whether she has this in mind when she is asking for their rights. Implicit in this argument is the assumption that the rights of homosexuals can be protected and fought for without questioning the underlying reasons for the deprivation of their rights. It would amount to saying that discrimination against women and dalits can be fought without questioning patriarchy and caste.

Moreover, one should be wary of the argument that gay and lesbian movements do not in any way contribute to social emancipation. We should remember that demands for the rights of women and dalits were met by similar reactions in the beginning on the part of some self-proclaimed marxists in this country. Civil liberties movement which draws its inspiration from the larger democratic movements takes up issues regarding the deprivation and discrimination with the understanding that underlying

systems of domination have to be opposed. Whether or not the civil liberties movement in the country takes up the issue of the rights of the homosexuals, asking it to do so in the manner Srikanth prescribes would be surely undermining the spirit of civil liberties in the country.

Just as removing all kinds of discrimination based on 'sex, race, class, sexual orientation, etc', as well as preservation and spread of democratic values is a task of civil libertarians, offering a critique of existing relations has been the task of the leftists, of all varieties. Orthodox varieties of Marxism have been deterministic in their analysis and authoritarian in their politics, and Srikanth's exposition of homosexuality falls exactly into this category and comes dangerously close to the various expressions of 'homophobia' prevalent in the west. That it should come in the guise of 'Marxism', while being Marxist neither in content nor in method is unfortunate to say the least. Though it is no secret that 'sexuality' has been a subject of taboo even among the Indian marxists, it comes as a rude shock to find such an ill-informed and authoritarian exposition from a self-proclaimed marxist.

**Safety first.
Or leadership that
helps protect all that
one holds dear.**

New India is one of the first fully
Indian insurance companies
Since its inception 75 years ago, New

India has remained firm in its pledge to
offer security and support to the people
of India

Over the years, New India has offered
a range of pathbreaking insurance covers
From cancer, mediclaim and birthright

(unborn child welfare) To low premium
personal accident policies for farmers
And cash compensation for the
underprivileged, in the event of
accidental death of sole breadwinner

These insurance covers from New
India are helping make life a lot more
secure. Physically and emotionally

No wonder, New India remains India's
leading general insurance company

Knowing New India

	1993-94
Global premium income	Rs.1616 crores
No. of offices	1197
No. of employees	24,500
No. of policy covers	124

NEW INDIA ASSURANCE

A subsidiary of the General Insurance Corp of India

75 years of solid, secure support

Our main insurance covers: Urban — All Risk • Baggage • Cash-in-transit • Pedal Cycle • Householders' • Shopkeepers' • Doctors' Composite Package • Mediclaim • Group Mediclaim • Overseas Mediclaim • Personal Accident (Individual) • Third Party Life • Students Safety • Birthright • Cancer • Multiperil • Insurance for LPG Dealers • Heart • Kidney Malfunction • T.V. • Bhavishya Arogya • Mutual Fund Package Rural — Cattle • Sheep • Horse/Pony/Mule • Pig • Camel • Poultry • Duck • Rabbit • Elephant • Dog • Brackish Water Prawn • Inland Fish • Silkworms • Honey Bees • Agricultural Pumpset • Animal-driven Cart • Hut • Gobar Gas Plant • New Well • Janata Personal Accident • Gramin Personal Accident • Composite Package for tribals • Farmers Package

**Great news for
international
businessmen.**

**From India's
international
businessman.**

The world is buzzing with the news: India has thrown open her doors to international business.

The new liberalisation policies are changing the Indian industrial and economic horizons.

This is your chance.

India is one of the world's most promising potential commercial centres with skilled technical knowhow and manpower.

The best you could find anywhere.

Indian professionals are valued very highly all over the business world. You'll also find that they are at home with all kinds of international business languages.

Speaking of which, when you are heading for India, make an excellent beginning: fly Air-India.

On board, you'll find reassuring proof of how well tuned we are to the ways of the world.

Trade and Growth: Issues for India

For developing economies, technological change and micro-level efficiency are as important as capital accumulation as a source of long-term economic growth. International trade is an important source of incentives in generating both intentional and by-product technological change by increasing aggregate economic activity (market size) and creating competitive conditions. In the present Indian context, selective policy intervention on the production side may provide a cutting edge in realising dynamic gains through trade. 3121

Reforms and Drug Industry

The oligopolistic nature of the industry, where a few companies have a monopoly within various therapeutic groups, makes the operation of the market particularly infructuous in the drug industry. The present policy of abandoning price and production controls has already led to unjustified rise in prices. These concessions and a possible change in the Indian Patents Act will return the drug industry to the situation prevailing in the 1950s, with the field wide open to the MNCs to earn super-profits through their control over technology and brand images. 3135

South Indian Cinema: New Spaces

In the spectacular spaces carved out by recent South Indian commercial cinema, one is beginning to notice a certain proliferation of popular idioms dealing with political questions, a phenomenon that demands to be seen as part of attempts in different realms to 'manage' the crises of our times. It is because of their direct and innovative engagement with the present that the films of directors like Shankar and Maniratnam have acquired a following that goes beyond the traditional 'class' audience and are coming to include a significant section of average movie-goers. 3129

Reforms and Productivity

Productivity trends in Indian industry over the period 1950-51 to 1992-93 show that there was a severe retrogression in efficiency patterns in the 1960s and 1970s which began reversing themselves only in the 1980s. There has been a further improvement in the 1990s, providing some evidence that the reforms may be working. M-46

Industrial Pricing

Mark-up pricing captures real world industrial pricing behaviour. Since the mark-up is a major component of the inflationary process, understanding variations in it will help to understand inflation. The mark-up is also the profit share and so affects both savings and investment decisions and influences medium-run growth. A study of the relationship between mark-up and activity for disaggregated sectors of Indian industry. M-54

'Good Governance'

We have a fairly sound format of good governance in an active parliament and state legislatures, an independent judiciary, free print media, a constitutionally-guaranteed system of decentralisation and a small but growing and vigilant civil society. But the values which are at the foundation of our republic are under assault through the process of liberalisation. 3109

Clueless on Privatisation

The lack of a comprehensive policy on privatisation stands out in contrast to other aspects of the economic reforms. A look at the possible outcomes of the non-policy on privatisation, focusing on the fiscal, efficiency and intersectoral dimensions. M-63

Survival at Any Cost

Wheeling and dealing has become the stark condition of the survival of the United Front in power. All the parties in the UF are engaged in this activity, with the prime minister emerging as the most consummate practitioner. 3098

Automobile Industry Contrasts

The automobile industry is currently experiencing impressive growth in South Korea, Brazil, China and India. A study of the evolution of the industry in these growing markets and the linkages between government policy, the degree of managerial control and indigenous capabilities and competitiveness. M-75

Small Industry Performance

Examination of the relationship between structure, conduct and performance of small-scale units in the chemical industry based on a study of a sample of units in Gujarat. M-79

Profit for Few or Food for All

WE are representatives of more than 1,200 organisations from some 80 countries, from all regions of the world. We seek to bring the message of the more than one billion hungry and malnourished people of the world, most of them children and women. Through regional and global consultations we have discovered and affirmed our mutual solidarity. Our collective vision derives from our knowledge that food security is possible. We regret that we will have but four minutes to share this vision with you.

We affirm first and foremost the basic human right to food. Everyone has the right to secure access at all times to safe and nutritious food and water adequate to sustain an active and healthy life with dignity. Neither food nor famine can be used as a national or international political weapon. Access to food cannot be denied to any nation, ethnic or social group for political, economic, religious or other reasons. Economic embargoes or international sanctions affecting populations are incompatible with food security. Those currently in place must be terminated.

The shame of global hunger and malnutrition compels action by all. At the same time, we insist that governments have the primary and ultimate responsibility to ensure national and global food security. The representatives of civil society gathered at the NGO Forum are in full agreement on some of the fundamental causes of food insecurity. The globalisation of the world economy, along with the lack of accountability of transnational corporations and spreading patterns of overconsumption have increased world poverty. Today's global economy is characterised by unemployment, low wages, destruction of rural economies, and bankruptcy of family farmers.

Industrialised agriculture, intensive animal husbandry methods, and overfishing are destroying traditional farming, poisoning the planet and all living beings. Subsidised exports, artificially low prices, constant dumping, and even some food aid programmes are increasing food insecurity and making people dependent on food they are unable to produce. The depletion of global grain stocks has increased market instability, to the detriment of small producers. Family farmers and vulnerable people are forced under International Monetary Fund and World Bank policies to pay the price of structural adjustment and debt repayment. National policies too often neglect these same groups. Official corruption erodes all efforts to achieve food security.

The proliferation of war, civil conflict, and environmental degradation is a growing source of hunger and food insecurity. Hunger and malnutrition are most severe in cases where these combine with natural disasters.

We propose a new model for achieving food security that calls into question many of the existing assumptions, policies and practices. This model, based on decentralisation, challenges the current model, based on a concentration of wealth and power, which now threatens global food security, cultural diversity, and the very ecosystems that sustain life on the planet. We highlight six key elements of this alternative model, along with steps toward its development and implementation. An integrated approach is required, thus simultaneous action is needed in each of these areas: (1) The capacity of family farmers, including indigenous peoples, women, and youth, along with local and regional food systems must be strengthened. All aspects of food and agriculture must be reoriented in favour of family farmers. Women play a central role in food security and must be guaranteed the right to productive resources and equal opportunities to use and develop their skills. Resources must be shifted in favour of local and regional food producers and food systems. Family farmers must be assured access to information and communications systems. (2) The concentration of wealth and power must be reversed and action taken to prevent further concentration. (3) Agriculture and food production systems that rely on non-renewable resources, which negatively affect the environment, must be changed toward a model based on agro-ecological principles. (4) National and local governments and states

have the prime responsibility to ensure food security. Their capacity to fulfil this role must be strengthened and mechanisms for ensuring accountability must be enhanced. (5) The participation of peoples' organisations and NGOs at all levels must be strengthened and deepened. (6) International law must guarantee the right to food, ensuring that food sovereignty takes precedence over macro-economic policies and trade liberalisation. Food cannot be considered as a commodity, because of its social and cultural dimension. Negotiations should be carried out to develop more effective instruments to implement the right to food. These instruments should include: A Code of Conduct to govern the activities of those involved in achieving the right to food, including national and international institutions as well as private actors, such as transnational corporations. A Global Convention on Food Security to support governments in developing and implementing national food security plans and to create an international network of local, national, and regional food reserves.

Civil society organisations are committed to ensuring follow-up to this World Food Summit, particularly in monitoring the Food Summit commitments and active participation in the Food for All Campaign. Hunger and malnutrition are fundamentally a question of justice. Unless we agree that the right of every human being to the sustenance of life comes before the quest for profit, the scourge of hunger and malnutrition will continue.

Time for a Touch of Boldness

POLICY-MAKERS in the government continue to be preoccupied with the stock market, as though boosting share values would revive industrial output and investment activity. It is apparently ignored that the depression of the capital market is just a symptom of the deeper malady of declining industrial growth. The finance minister and other government functionaries have been prodding foreign institutional investors (FIIs) to come forward with larger amounts of portfolio investment even as the government and the RBI have taken a series of measures directed at the capital market. As part of its busy season credit policy the RBI allowed banks to purchase shares and debentures in the secondary market. Following up the proposal in the finance minister's budget speech, the SEBI has permitted dedicated debt funds of FIIs to subscribe to the whole of a debt issue. It has also taken a number of other measures such as the extension of the BSE's on-line trading (BOLT) system to any other stock exchange with a screen-based trading system and even permitting stock brokers to set up shop in cities without regional stock exchanges. The SEBI has given up vetting offer documents altogether and the minimum application size has been reduced from Rs 5,000 to Rs 2,000. Debt instruments have been allowed to be listed prior to the listing of equity on stock exchanges and mutual funds have been allowed to enter other fund-based business. In its latest measures, the SEBI has conferred on the OTCEI the status of a regular stock exchange and allowed instruments like futures and options, forward contracts on stocks and other forms of forward transactions. Earlier the SEBI had approved in principle the NSE's proposal to start futures and options trading and a committee has been appointed to operationalise the proposal. The SEBI chairman has also announced that a regular stock-lending scheme would be introduced and an expert group would be appointed to work out the modalities of regulating short sales. Speedy action has also been taken to create a share depository system.

Some of these measures were undoubtedly necessary and even overdue, but they are not likely to address the fundamental problem of the capital market of excessive speculation. They are much less likely to push up industrial investment and growth. The authorities refuse to acknowledge that the earlier acceleration of industrial output was the outcome of certain temporary and unsustainable aspects of the liberalisation process and that once their impact had been spent, the slowing down of growth was inevitable. A sustained rise in industrial investment and output calls for equally sustained improvement in domestic saving and investment supported by expansion of domestic demand and growth of manufactured exports. Instead what the economy actually witnessed was the injection of massive

external liquidity for a short period of about a year accompanied by some expansionary impulses from middle and upper class consumer spending and from government expenditure during the three years from 1993-94 to 1995-96 when the fiscal situation had deteriorated and larger disbursements were effected for special employment programmes. But these 'favourable' developments could not last long. There occurred a sudden drying up of liquidity, sharp increases in interest rates, tapering off of demand for consumer durables and postponement of many private sector industrial projects due both to shortage of liquidity and high interest rates and to reassessment of business prospects by entrepreneurs. These factors have been compounded by the slowing down of exports and the new finance minister's ideological commitment to containing the gross fiscal deficit this year within 5 per cent of GDP.

Despite the quite sharp dip in domestic saving and investment, the authorities initially refused to take seriously the signs of deceleration of industrial growth and investment. And when the shortage of investible funds became manifest and the primary and secondary capital market went into a tailspin, their immediate response was to turn to the FIIs to come in and inject dynamism in the market. The RBI was also made to release large amounts of liquidity through lowering of banks' cash reserve. While these measures have helped to expand short-term liquidity, they have done little to direct institutional funds to the productive sectors and at a reasonable cost. They have also failed to attend to the other problems of insufficiency of domestic demand in general and of public development expenditures in particular, the slump in domestic saving and investment and entrepreneurs' misgivings about industrial growth prospects. Many of these are longer term issues which cannot in any case be dealt with by short-term palliatives. Nevertheless, the momentum of growth could have been substantially preserved if the authorities had adopted a more positive fiscal and monetary policy stance with a clear commitment to supporting productive investment by commercial enterprises in the public and private sectors and to government development expenditure. There is an acute shortage of funds with the term-financing institutions which consequently have been competing for funds among themselves, in the process pushing up the cost of funds for their industrial borrowers. The Reserve Bank which used to play a promotional role in the past now takes a back seat in providing long-term assistance for industrial development, though the RBI's own reserves have been substantially enlarged by the sharp rise in average interest rates in the economy. The high net profits of the RBI have a contractionary impact on the economy and so there is a sound case for the RBI's reserves

to be used to augment the resources of term-financing institutions.

The RBI will also need to take steps to overcome the current reluctance of banks to make advances, particularly to medium and small units. Left to themselves banks are loath to deploy even the additional liquidity released by reduction of the CRR for commercial lending. They have instead pushed up their investment in government securities, generally expanded their treasury operations and brought down outstanding refinance from the RBI. These tendencies have been encouraged by the RBI's own credit and monetary policy stance which has promoted treasury operations. If bank credit is to provide an impetus to industrial activity, the RBI will have to evolve policies which induce banks not only to expand credit but also achieve a better distribution of bank credit among different sectors. Well designed sector-specific refinance and rediscount facilities in favour of medium and small units and agriculture and the informal sectors are, therefore, more relevant now than ever before. Even large and medium industrial units, many of whom have been hard put to it to raise funds from the capital market, need more working capital and term loans. In this situation if the RBI were to provide funds at the margin at, say, 2 percentage points below the Bank rate of 12 per cent as refinance or rediscount facilities for specific sectors and purposes, it would boost commercial bank lending and also influence the banks' lending rate structure.

Above all, the finance minister needs to give up his obsession with restricting the gross fiscal deficit this year to 5 per cent of GDP. The link between the fiscal deficit and inflation is far from proven. If resources are productively used, the activities promoted through an even larger fiscal deficit can have multiplier effects for the economy. Many developed countries have not hesitated to let government liabilities rise to near 100 per cent of GDP compared to our own less than 60 per cent (taking the centre and states together). There is substantial scope for expanding public sector expenditure programmes provided there is a serious effort to make them more efficient and productive. Against this background, rigid postures on the government's resort to ad hoc treasury bills have a contractionary impact on the economy. On the other hand, conventional deficit financing, properly managed, in the range Rs 10,000 to 12,000 crore a year (or about 1 per cent of GDP) can play a positive role in stimulating economic activity.

ENVIRONMENT

Judiciary's Role

WITH the Supreme Court's increasing involvement with industrial pollution, several issues, nebulous or unstated so far, have

been brought into focus and are posing crucial questions before progressive people's movements. The issue of industrial pollution and the hazards posed by manufacturing units made its presence felt with the Union Carbide disaster. With the consequent public awareness and the enactment of several legislations, new or amending old acts of parliament, the courts became far more accessible than they had been before. While the acts have ensured the setting up of relevant authority, the courts in the meanwhile have plunged into the clean-up act wholeheartedly. It isn't that such access to the courts has not yielded results which had hitherto been out of reach of populations which are victims of pollution. However, by and large, it has not succeeded in either strengthening or expanding the existing institutional framework for controlling or monitoring pollution. In the Ganga clean-up case, for instance, the apex court all but directly supervised the implementation of its orders. In another case in 1994, the Supreme Court ordered the payment of compensation to affected villagers in Pattancheru in Andhra Pradesh and obtained an assurance from the state government that it would set up an effluent treatment plant to serve the 22 industrial units in the area. However, it set no time-limits nor any mechanism to ensure that the action would be reported to the Supreme Court. The question here is when the courts issue directives involving technical matters or calling for the setting up of new bodies or authorities, should it not become the responsibility of the court to ensure that its directives are carried out? In the absence of this, the victim population is forced to approach the court again and again and, over a period of time, public actions directed at organising and educating people on environmental security and innovative responses to the problems posed by a necessary industry and unnecessary hazards peter out.

Another issue that has come into sharper focus today is that the courts' decisions often sharpen existing conflicts over the environment. For instance, the apex court's directive to shift industries from Delhi will, when implemented, render thousands of workers jobless or uproot them. Nevertheless, the shifting of polluting industries will effectively render the environment in the city healthier. Not surprisingly, there has been resistance from the workers, though not very organised. What is ironic is that they are as much affected by the pollution. In fact, in all probability most of these polluting industries are likely to be among the more hazardous of working places. But willy-nilly, workers often become ardent supporters of the industry in opposing such efforts without extracting any concessions or promises. In effect, workers see the

environment movement and in fact all efforts to protect the environment as necessarily threatening their livelihoods and survival.

Over the decade or so when environmental consciousness has generated a certain amount of action on the part of the government, the labour movement in India has made little headway in incorporating an environmental perspective in the workers' consciousness. Part of the current crisis of the labour movement lies in its inability to see beyond wage-related issues. That this is an old critique does not make it less urgently relevant today. Hitherto the operation of democratically established administrative authority dealing with pollution issues offered greater flexibility with regard to seeking alternative solutions or at least blunting the edge of conflict between the environment groups and workers. Courts' directives, however, provide less opportunity for creative alternative solutions to emerge. And it is in this context that the role of the courts in pollution control and environmental issues needs to be viewed. And equally, the resort to courts, rather than to the organising of public action directed at forcing the appropriate state machinery to take action, it may be argued, will eventually constrict the space for progressive actions. The resort to courts, it would appear, can be seen to be a progressive move only in the context of vibrant people's (including workers') movements, which can translate its directives, whatever they may be, to strengthen and broaden the movement.

POLITICS

Demands for Statehood

THE revival of the Subhash Ghising-led agitation for a separate state of Gorkhaland, which has received a fillip from prime minister Deve Gowda's promise of Uttarakhand, has raised a number of important questions and highlighted interesting developments.

First, the fundamental issue of nationalities and minorities and their right to separate statehood is dividing the Indian Left. In the past, during agitations demanding the creation of states on linguistic basis, the Left stood united in support of such demands. Today, when regional groups like the Uttarakhandis in Uttar Pradesh or predominantly tribal groups like the Jharkhandis in eastern India or the Bodos in Assam are demanding separate states, the CPI(M) and the CPI do not seem to see eye to eye with each other. On the Gorkhaland issue, the CPI(M) is opposed to the further division of West Bengal, while the CPI has lent its support to the demand. Even within the CPI(M), the entire Darjeeling district committee has rallied its followers behind

the call for a separate state and has joined the Subhash Ghising-led agitation, in defiance of the warnings issued by the West Bengal state party leadership. The CPI, a major partner in the West Bengal Left Front, sent its two important leaders, including water resources minister, Nanda Gopal Bhattacharya, to Darjeeling to endorse the demand for Gorkhaland. At the centre, home minister Indrajit Gupta of the CPI assured Ghising of due consideration of his demand when the Gorkha National Liberation Front (GNLF) leader met him in Delhi recently.

While the CPI(M) has made no bones about its total opposition to further division of existing states and creation of new smaller states as a matter of principle and has objected to Deve Gowda's promise of Uttarakhand, the CPI is yet to clarify whether its support to Ghising is a part of a general policy to support similar demands in other areas by other groups or whether its stand on Darjeeling is a tactical one, to spite the CPI(M), which has been behaving like a bully in inter-party relations in West Bengal all these years.

The other issue which has been brought to the fore by the revived Gorkhaland agitation is the concept of 'autonomous councils' and their limitations. These councils were evolved in some states to satisfy the demands made by minority groups there for more administrative powers. The CPI(M) formulated this mechanism for the tribal people in Tripura and the Nepali-speaking population of West Bengal in Darjeeling. Later in Assam, similar autonomous administrative bodies were set up for the Bodos and the Karbis (in the Karbi Anglong area). But such experiments seem to be floundering. In Bodoland, for instance, a Bodoland Autonomous Council was set up in 1993 under an accord between the centre and the Bodo leaders (who were agitating for breaking away from Assam to form a separate state). But the provisions of the accord remained unfulfilled, mainly due to the divide and rule policy followed by the Congress government in Assam. The new AGP government there also appears to be following the same policy by propelling a rival Bodo group – the People's Democratic Front – against the All Bodo Students' Union (ABSU) which had been campaigning for a separate Bodoland since 1987. In Karbi Anglong, the Karbis are complaining about the state government's policy of 'Assamisation' of their culture by insisting on Assamese only as the medium of college education in the Karbi and North Cachar Hill districts. It seems that the Assam government is behaving towards the tribal minorities in its state in the same way as the centre has treated Kashmir (by encroaching on the autonomy granted to it after its accession to India).

In Darjeeling, the picture is slightly different. The hill council there, dominated by Ghising's GNLF, has so far failed to come up with any significant achievement by way of development of the hill areas. There are allegations against Ghising in financial matters, since he has failed to give any statement of expenditure of the money that he has received for the council from the state government.

This raises the next important question. Will separate states *per se* solve the problem of backwardness and underdevelopment in the regions inhabited by minorities of different types, whether ethnic or other? Even if granted full control of a separate state, where is the guarantee that the leaders of these groups will behave in any way different from the dominant political parties of the majority groups? Barring the leaders of the Autonomous State Demand Committee of Karbi Anglong (who have shown political maturity and moral steadfastness), most of the leaders of the various regional movements who have been demanding separate states have quite often exposed their venality in personal dealings, and xenophobia against other minority groups in their own territories. The allegations of bribe-taking against important Jharkhand leaders are an example of the former, while the frequent cases of inter-tribal conflicts (e.g. Bodos killing Santhals) in the north-east illustrate the latter. If these leaders come to power in new states, can their poor followers in their own respective communities expect a brighter future or will they watch their leaders using their newly-acquired power for their personal benefit? Can the other minority groups – tribal or linguistic – inhabiting these new states feel safe under administrations controlled by intolerant xenophobic politicians?

Riding piggyback on the aspirations and just grievances of long-neglected minority groups in states who had either remained largely outside the government's poverty-alleviation measures or had been victims of the government's lopsided development policies, the new generation of a sub-elite class that has developed from among them is demanding separate states in the hope of grabbing power and patronage. Once in saddle, they will replicate the same system of exploitation and corruption in the new states that has become endemic in the centre as well as the states.

BJP

Back to Hindutva?

THE euphoria of similar occasions in the recent past was missing at the national executive meeting of the Bharatiya Janata Party (BJP) at Jaipur. The action plan cobbled together on the final day of the three-day

meet – centring on the launching, in the latter half of December, of a 'jail bharo' agitation against corruption in high places and the throttling of democracy – is too hackneyed to overcome the setbacks the party has suffered recently in Gujarat, Madhya Pradesh and Uttar Pradesh. The party, which had Delhi almost in its grasp not so long ago, appeared to be returning to the Hindutva issue around which to regroup its support.

The high-point of the Jaipur meeting was the tussle over the policy of so-called social engineering advocated by Govindacharya and Kalyan Singh and opposed vehemently by Murali Manohar Joshi, Kalraj Mishra and Lalji Tandon. Though the report prepared by Govindacharya probing into the poor performance of the party in the UP elections was watered down to assuage the hurt feelings of the rival group, Govindacharya's remarks as the head of the five-member committee appointed by L. K. Advani ruffled many feathers. According to Govindacharya, at least a couple of dozen seats, and many of them in the Allahabad region especially, were lost due to the wrong choice of candidates. These remarks sparked off stormy scenes with Joshi, who represents the Allahabad region in parliament, voicing his disagreement with the assessment. According to the Joshi, Mishra and Tandon group, it is the policy of social engineering aimed at bringing dalits and the most backward castes closer to the party by giving them a larger share of party tickets that was the main cause of BJP's poor performance. Though the OBCs were given one-third of the seats, the party was able to win few of them. Of the 176 seats won by the BJP-Samata alliance, 95 were won by brahmin, rajput, jat, bhumi-har, bania and kayastha candidates. In the tribal belt, the BJP managed to secure just one seat, while Mulayam Singh's Samajwadi Party and Kanshi Ram's Bahujan Samaj Party were able to win 20 and 12 seats, respectively. The national executive meeting clearly saw the reassertion of Hindutva over mandalisation.

This shift of opinion within the party leadership has also the support of the RSS chief, Rajendra Singh, who in his Dussera rally admonished the BJP for straying away from the path of Hindutva. The strengthening of the grip of the Hindutva lobby over the party affairs can be gauged from the fact that S. P. Gautam and J. P. Mathur, both Rajya Sabha MPs of the BJP from UP who are known to favour social engineering, have been denied tickets. The VHP too has chided the BJP for forsaking the cause of Hindutva and declared its intention to revive the issue of Krishna Janmabhoomi at Mathura. The decision to postpone the organisational polls in Gujarat and Madhya Pradesh is yet another indication that the social engineering strategy has left the BJP in a bit of a quandary.

CURRENT STATISTICS

EPW RESEARCH FOUNDATION

Macro-economic trends portray generally a disappointing performance in almost all sectors of the economy. Real sector growth is expected to stagnate or decelerate mainly due to reduced growth impulse from the government budget. Domestic saving and investment ratios will barely reach the levels of 1990-91. Export-import growth may slump to very low levels. Capital market is slated to remain depressed. Monetary growth may accelerate but without impetus to domestic credit growth. Inflation rate may remain high, in the range of 8 to 10 per cent.

* Some of these are annualised/expected projections based on informed judgement, except fiscal data which are as per budgets; saving and investment ratios for 1995-96 are also similarly projected.

JCT

New Projects Shelved

AFTER considerably improving its performance in 1994-95, JCT, an M M Thapar group company, saw a drastic fall in profitability in 1995-96. The company is engaged in the manufacture of cloth, polyester staple fibre (PSF), nylon filament yarn (NFY), polyester filament yarn (PFY), polyester chips, partially oriented yarn (POY), nylon chips and steel/strand wires. While net sales increased by 10 per cent and value of production improved by 14.7 per cent over the previous year, a sharp rise in manufacturing expenses (up 33.5 per cent) and other operating expenses led to a steep decline in operating profit (down 45.1 per cent). Though interest charges fell by 11.2 per cent (despite an 81.4 per cent increase in term loans), a 31.7 per cent rise in depreciation resulted in a 72.7 per cent fall in net profit during the year under review. But for a large net non-operating income of Rs 21.4 crore (1994-95: Rs 6.2 crore), which accrued mainly from the sale of investments, and nil taxation, the company would have gone into the red. Further, other income stood at Rs 49.3 crore and formed 275 per cent of net profit.

The textile division, which contributed 27 per cent of the company's turnover, saw a 3 per cent fall in production of cloth during 1995-96. Sale, however, was higher by 1.9 per cent in volume terms at 5,69,64,000 metres. The synthetic fibre division, which contributed 55 per cent of the company's turnover, also performed poorly. Production of PFY and PSF was also lower at 3,092 tonnes and 27,893 tonnes, respectively, due to stoppage of operations at the plant for enhancement of capacities. There was a sharp fall in prices of PSF during the year under review following the sudden withdrawal of China from the international market, and these were only partly offset by a corresponding reduction in raw material prices.

The steel division, which accounted for 8.6 per cent of total turnover, managed a 11.2 per cent increase in sales during the year under review and launched its strand wires into the market for the first time.

The company's exports fell from Rs 83 crore in the previous year to Rs 81 crore while imports, consisting of raw material and capital goods in equal parts, rose significantly by 143 per cent to Rs 288.3 crore.

The state of the industry has not improved in the current year. The company has shelved its Rs 600 crore PSF project, which was expected to be commissioned during this year, due to depressed market prices and high cost of manufacture. Though JCT had already firmed up a Rs 200 crore credit line

from Hermes Export Finance Agency of Germany, the company was unable to garner adequate funds from Indian lenders. The Rs 1,700 crore purified terephthalic acid (PTA) project, which would have catered to a significant part of the company's raw material requirement, has also been shelved. JCT had already entered into a tie-up with Zimmer, a German petrochemical giant, for technical collaboration in the PSF project while the PTA project was to be set up in collaboration with the Japanese petrochemical giants, Mitsubishi-Mitsui.

With the fall in earnings per share (EPS) from Rs 5.5 in 1994-95 to a mere Rs 1.5 in 1995-96, the company's share price has declined to Rs 8.5 on the bourses. The low discounting of 5.7 times the company's 1995-96 earnings also reflects the state of the synthetic fibre industry as a whole.

PREMIER AUTOMOBILES

Modernised Plant

Premier Automobiles (PAL), manufacturer of Fiat and 118NE cars, saw a mixed performance during the 18 months ended March 31, 1996. While net sales improved by 3.8 per cent and value of production was higher by 7.8 per cent over the previous period (18 months ended September 30, 1994), net profit fell by 32.3 per cent. However, a 7.7 per cent fall in manufacturing expenses and an overall fall in other operating expenses led to an increase in operating profit from Rs 12.7 crore to Rs 77.7 crore. The absence of any non-operating profit compared to a non-operating profit of Rs 77.6 crore in the previous period following the sale of a plant resulted in a lower bottomline. There was only a marginal rise in interest charges and a 26.7 per cent fall in depreciation charges. The company's term loans were lower by 59.75 per cent following repayment with cash received from the sale of the Kalyan plant. The company also received 840 lakh equity shares of Rs 10 each aggregating Rs 84 crore of Pal Peugeot (PPL) as part consideration for the above mentioned plant.

Though production of automobiles during the year fell by 16.8 per cent from 36,136 vehicles to 30,066 vehicles, the boom in the automobile industry helped the company attain a growth of 32 per cent in sale of its Padmini model cars (both diesel and petrol) from 22,842 last year to 30,078 in 1994-96. Though the company has transferred its Kalyan business, where 118NE/1.38D cars were produced, to PPL last year, it continues to supply various components required by PPL for the manufacture of the 118NE.

The company's machine tool division too improved its performance with a 108 per cent rise in sales at Rs 58 crore. Sales would have been higher but for tight liquidity. The

division has entered into a technical know-how agreement with Hermann Pfauter of Germany to manufacture CNC gear hobbing machine Model PE 250 in India and commercial production is expected to commence shortly.

Following the agreement with Fiat Auto, Italy, for the manufacture of UNO model cars, the company's Kurla plant is being completely modernised for establishing state-of-the-art manufacturing facilities which will also be usable for Padmini cars. The company plans to reduce dependence on imports and indigenise the components of the UNO car. It has already succeeded in indigenising wheels, wheel caps, jacks, seats, tyres, horns, batteries, etc, and steps have been taken to achieve an indigenisation of around 40 per cent by end-December.

The strike at the company's plants seems to have ended with most of the workers resuming duty in the past few days. Workers have also resumed work at PPL's plants at Dombivili and Kalyan.

With the fall in profitability during 1994-96, the company's EPS fell from Rs 12 last year to Rs 8.1. The company's falling bottomline has resulted in a fall in the company's market price from Rs 63 a year ago to Rs 26 on the bourses, discounting the company's annual earnings by a mere 3.2 times.

LLOYDS STEEL INDUSTRIES

Higher Turnover

Lloyds Steel, part of the 2000-crore Lloyds group, saw a sharp increase in turnover in 1995-96 following the first full year of operation of its hot rolled (HR) coil plant and the commissioning of its new plants for cold rolled (CR), galvanised plan (GP) and galvanised corrugated (GC) coils/sheets in December 1995. The company's main business consists of manufacturing HR coils/plates/sheets (carried out under the steel division) and the fabrication of machinery and structurals (carried out under the engineering division). While the former division contributed up to 68.2 per cent of the company's turnover for the year under review, the latter contributed the balance 31.8 per cent.

During the year, the HR coil plant managed to attain an 86 per cent capacity utilisation, producing 3,45,788 metric tonnes (mts) of coils against 1,44,527 mts produced in the previous year when the plant operated for six months only. Sale revenue too increased from Rs 226 crore in the previous year to Rs 668 crore, up 198 per cent on an annualised basis. The higher realisation was due to the company's strategy of deeper penetration into the value added product segments and niche markets and the opening of additional branches to strengthen its marketing network.

(Rs lakh)

The GP/GC sheets/coils plant, during its first four months of production, produced 34,689 mts of sheets and coils which were marketed through the company's existing network. Sales from the new plant contributed 3.7 per cent to the company's turnover and is expected to add over Rs 100 crore to turnover in the current year. The buoyancy in the capital goods industry in the previous year and the execution of orders secured then helped the engineering division post a 54 per cent higher turnover at Rs 31.3 crore in 1995-96.

While value of production increased by 115.3 per cent with increased production and sales during the year under review, a lower increase in operating expenses helped the company post a 170 per cent increase in operating profit. However, a lower non-operating profit of Rs 1.44 crore (1994-95: Rs 24.7 crore) and a sharp increase in interest (up 241.8 per cent) and depreciation charges (up 121.7 per cent) somewhat nullified the earlier increase in profitability. Consequently, net profit rose by a lower 59.8 per cent. The sharp increase in interest charges was mainly due to the full year's interest on borrowings for the HR coils project being charged to profit and loss account, as against capitalisation of interest up to commissioning of the project until the previous year. The need for a larger working capital and the high interest rates prevailing also added to the company's problems.

With a view to consolidating its position in the steel industry, the company had earlier undertaken a massive forward integration programme in two phases. The first phase for setting up a 1,50,000 tonnes per annum (tpa) of CR coils and 1,25,000 tpa of GP/GC sheets/coils was completed during the year under review and the second phase which consists of setting up facilities for 2,00,000 tpa of CR coils is expected to be completed in the current year.

Meanwhile, during the current year, a 3 to 8 per cent cut in customs duty on the end products and the increase in administered prices of major inputs such as coal, fuel, power and transport is expected to put pressure on the company's margins. Slack international prices, increased supply and competition also prevent the company from passing on the increased input cost to customers in the immediate future.

Despite its growth plans, the company's share price seems to have suffered following its frequent forays into the capital market. The Rs 210 crore rights issue, which opened on March 27 this year, devolved and the company was able to raise its balance funds only with the help of underwriters. The huge dilution in earnings that is expected after allotment and conversion of warrants will bloat the company's equity to a significant extent. Consequently, despite an increase in earnings per share from Rs 8.8 in 1994-95 to Rs 9.6 in 1995-96, the company's share price currently languishes at a mere Rs 12 on the bourses.

NFW DELHI

UF Government: Survival at Any Cost

BM

Wheeling and dealing has become the stark condition of the survival of the UF in power. All the parties in the UF are engaged in this activity, with the prime minister emerging as the most active practitioner.

THE leaders of the left parties are very fond of proclaiming from time to time that the Congress Party, the second largest party in Lok Sabha, has no option but to support the UF government headed by Deve Gowda. They obviously like to feel smug and secure about the stability of the government so that they can be comfortable under its benign patronage. Harkishen Surjeet of CPI(M), which is supporting the government from outside like the Congress Party, said the other day that this is the only way the BJP, the largest party in Lok Sabha can be prevented from coming to power and secularism can be defended. The CPI leader, Indrajit Gupta, who gave up the office of the general secretary of the party to become home minister, has also no apprehension of the Congress withdrawing its support to the UF government. He, therefore, believes that Deve Gowda government would complete "its full term".

The stand of these left stalwarts, ironically, coincides with that of P V Narasimha Rao, the former prime minister who was ousted from power by the electorate voting against him and his party in the general election. Rao has bounced back into political business after securing bail from the courts where he is facing trial on criminal charges. He has declared with gusto that Gowda would last the full term as prime minister. However, there has been a storm in the Congress tea cup over Rao's support to Gowda. Sitaram Kesri, the Congress president after Rao was forced to vacate the position, has been asserting that Congress support to the UF government is no longer unconditional. The notion of a 'full term' for the government was actively canvassed by Rao when he was heading a minority government and trying to muster majority support by means fair and foul. For the left leaders to subscribe to this notion is indeed remarkable. It means that they have lost confidence in the democratic option of mass mobilisation to such an extent that they have allowed themselves to be drawn into finding a place in the power structure by devious ways. They do not seem to bother too much any more if their political adversaries – not only BJP but the Congress

Party as well – taunt them for themselves having no option but to support and prop up the Deve Gowda government, however questionable be its performance and democratic credentials.

The fact, after all, is that the disparate political parties which have formed the Deve Gowda government have cynically resiled from their pre-election ideological, political and policy commitments. With the principle of accountability so violated, even the left parties have been attempting to blur ideological positions and side-tracking contention on policy issues. While the Deve Gowda government has been functioning as a stop-gap arrangement, the left leaders seem to think that under the prevailing conditions and alignment of political forces, they can play only a limited role in the political power set-up. Their leaders however fondly hope that they can influence government policies by playing the role of pro-active advisors to those who are really holding the levers of power in the UF set-up, especially the prime minister. This explains their hectic activity and energetic exercises in influence peddling. This is not a novel phenomenon, of course. Some of the leaders of the left parties, when they found it arduous to build a mass support base, have tended to adopt and relish this role in the past as well.

A noteworthy feature of the political scene currently is faction-forming and in-fighting in all the political parties, which offers wide opportunities for ambitious individuals for garnering personal gains. It is not surprising either that while relations between the leading lights of the UF parties are getting strained, Narasimha Rao, in spite of the many odds against him, has found help and support within the UF. He is widely perceived to be enjoying close rapport with the prime minister. Deve Gowda, once he was catapulted to the exalted office of prime minister, has been striving to perpetuate a system of policy-making and administration under his personal control and for personal ends. Besides assembling those he considers personally loyal to him to run sensitive posts in the government set-up, he has shown no

hesitation to look for political support outside the UF in order to perpetuate himself as prime minister for a 'full term' *ala* Narasimha Rao. He is very keen to outgrow the status of a choice of convenience of the king-makers in the UF. But the snags in his way are still formidable. He has to constantly search for more and more 'outside' supporters for his survival as prime minister. Both by design and default, his political and administrative moves have, therefore, tended to be fitful. He has been inclined to be alternately brazen and humble when his actions and performance are questioned.

The entrenched vested interests in the political power structure in India have shown over the years a remarkable proficiency in managing political-party alignments in their favour and perpetuating their hegemony. They have adopted ingenious ways to bring together from time to time seemingly disparate social and political trends and forces on an essentially right-wing platform. This has been a complex process of political-ideological management. The Congress Party has shown remarkable panache in this exercise during its political hegemony extending over nearly five decades. It managed to marginalise the more intractable political parties and groups, especially those with a leftist orientation, and assemble within its fold upper segments of society and reactionary political forces. Side by side, individuals with influence among the popular masses were co-opted with considerable success in the political power structure. Similar efforts are being made in the era of coalition politics too. But these efforts are devoid of the customary skill of the Congress Party so long as it enjoyed policy hegemony and lack finesse. Of late, in particular after the formation of the United Front government headed by Deve Gowda, they have become crude and grotesque and public aversion to political corruption has become both widespread and articulate.

The rapport between prime minister Gowda and former prime minister Narasimha Rao has been widely noted as a fishy arrangement. There are now reports which cannot be dismissed casually that Gowda is trying to enter into a similar understanding with Sitaram Kesri. The leaders of the left parties have occasionally questioned the nature and purpose of the Congress-UF relationship and repudiated a possible 'deal' between Gowda and Rao or Kesri. There have been protests also when it is asserted that the Congress has no alternative but to support the UF government unconditionally. But even as the conditionalities governing Congress support for the UF government have surfaced, the left parties find themselves

in an awkward position. They have now to put up with jibes that they too have limited their options and have to support the Deve Gowda government but for an occasional outburst against its performance.

What is disconcerting is that the wheeling-dealing has become stark as a condition of the survival of the Deve Gowda government. All the parties in the UF front are engaged in this pastime, with Gowda the most active practitioner. Be it the question of formation of a government in UP after the fiercely fought elections or installing a government headed by defectors from BJP in Gujarat, wheeling-dealing is taking precedence over democratic accountability and transparency. The affairs of the Janata Dal are being managed on the same basis. The economic policy reservations were readily put aside by the left parties in the UF steering committee to maintain unanimity over the UP imbroglio. The moves to arrange nominations to Rajya Sabha, going so far as to seek a seat for a union cabinet minister known to be a personal nominee of the CPI(M) general secretary from Jammu and Kashmir have been extraordinary to say the least. Ramoowalia may now have to be accommodated from UP as part of a deal between Surjeet and Mulayam Singh. Meanwhile, the move to enlarge the list of OBCs for reservations has been shot down, much to the discomfiture of Gowda.

The disillusionment of the people over the promises and performance of the UF government has already begun to surface. Popular discontent is bound to grow and spread even as the political cohesion of the UF is visibly weakening. The left parties, in particular, are already in a very vulnerable position. They are exposed to the taunts of the ruling clique and the political opposition as well as derision from within their own mass support base. The mood in their trade union wings is becoming restive. The organised workers are no longer amenable to the restraining influence and conveniences of their political leaders. It is remarkable that the leaders of the left parties remain oblivious of the further erosion of their already relatively weak popular support base because of their association with the Deve Gowda government. They do not seem to realise that in the face of the conflict of political and social interests, the secular thread cannot hold the UF together. Dents in the secular front have become visible. The UF government has not paid much respect to policy commitments. If the democratic contest is vitiated or thwarted by shady deals and misuse of the administrative apparatus the consequences are bound to be grave. The popular verdict on policies and principles must be honoured. Any move to pre-empt the verdict of the electorate is to vitiate and emasculate the democratic process.

The spectre of political instability has not disappeared. The UF led by Deve Gowda has not turned out to be a coalition which can be an authentic and viable alternative to the prolonged single-party domination of the Congress Party. The Congress Party after losing its political hegemony has been enfeebled in the last five years to an extent that it is not likely to revive either. Popular discontent meanwhile is surfacing and gathering momentum. The UF partners will be well advised not to strike brave postures and proclaim that their government will enjoy

a full term just because no party or MP is ready for an early general election. A sad feature of the political scene after the electorate ousted the Rao government is that the opportunities which had arisen for meaningful realignment of political and social forces have been missed and the hiatus between the so-called mainstream political parties and popular masses is widening. This can only strengthen the political articulation and manifestation of popular protest outside the mainstream political parties with implications and consequences of a far-reaching nature.

TAMIL NADU

New Start in Local Government

P S Vijaya Natha Raj

The erstwhile AIADMK government had repeatedly put off elections to local government bodies on one dishonest pretext or the other. The civic elections in October, held after a gap of 15 years, thus gave a new start to local government in Tamil Nadu. They were also the first to be held under the new dispensation provided by the 73rd and 74th Amendments to the Constitution.

SINCE 1967 politics in Tamil Nadu has projected the hegemony of regional parties. For three decades none of the national parties has been strong enough to fight and win elections without the support of either DMK or AIADMK. Against this backdrop, an attempt is made here to analyse the verdict of the recently concluded civic elections.

The state has so far seen five elections to rural local bodies and a few to urban local bodies since its formation in 1956. Grass roots democracy and local political institutions have been at the mercy of the party in power in the state. The paradox is that while both DMK and AIADMK have strongly pressurised the central leadership for more powers for the states, they tried to control the local administration for their political convenience. The newly enacted 73rd and 74th Constitutional Amendment Acts attempt to put an end to this decades-old system. The elections to the local bodies in October this year were conducted under the new dispensation.

PAST PANCHAYAT ELECTIONS

The state witnessed four elections in the rural areas under the Tamil Nadu Panchayat Act, 1958. The first was held in 1959, phased through the year. The ward members of the panchayats alone were elected directly by the people, while the heads of the panchayats and panchayat union councils were elected indirectly. The elections, which were

supposed to be non-party, saw political power passing into the hands of those in the top echelons of the rural society. The second election was held in 1965 in two phases. The first phase was for electing ward members of both town and gram panchayats and ended on February 2, 1965, covering 13,030 panchayats. The election of presidents of panchayats and panchayat union councils was held in April 1965 as a second phase by the indirect system. The elections this time showed signs of party colours, though 30 per cent of the ward members of panchayats were declared elected unopposed.

The third election was held in July-August 1970 with a notable change in the electoral system. For the first time, presidents of panchayats, along with ward members, were elected directly by the people, while the indirect system was retained for electing the heads of panchayat union councils. The first phase of the election was held towards the end of July in all the 13,184 panchayats. The election of the chairmen of the panchayat union councils by the indirect method was held in August 1970. The split in the Congress Party into R and O helped to sharpen the fight among the political parties, though the election was still supposed to be on a non-party basis. The election verdict went in favour of the DMK and against the Congress(O). DMK secured 3,315 posts of presidents of panchayats, followed by 2,711 secured by the Congress(O). In the election of chairmen of the panchayat union councils

it was a tug-of-war of money and muscle power between the DMK and Congress(O). Of 369 seats to which elections were held (in five seats elections were countermanded), the DMK gained an edge over its rival. Both parties surrendered some seats to the independents with a view to reducing the chances of the other. The partywise break-up of seats was as follows: DMK 144, Congress(O) 132, Congress(R) 6, CPI 5, Swatantra 4, Forward bloc 3, Toilers Party 2, CPI(M) and Dravidar Kazhagam one each, Farmers' Association 8, Independents backed by DMK and Congress(O) 12 and 15, respectively, and 36 other independents. In short, the third panchayat elections opened a new chapter of party politics in the political process at the grass roots level.

The fourth local body elections were held in February 1986, simultaneously for rural local bodies and municipalities. Some new features were introduced in the system. They were (a) lowering of the voting age from 21 to 18 years and (b) applying direct election method for all offices, viz, ward members and the presidents of both gram and town panchayats, chairmen of panchayat union councils and both ward members and chairmen of the municipal councils. Election of the heads of municipalities, panchayat union councils and town panchayats were on party basis, while those of ward members at all these levels and presidents of gram panchayats were on non-party basis. There were 12,610 posts of presidents and 1,37,155 of members from 53,947 wards in gram panchayats; 628 presidents and 9,065 ward members of town panchayats; 382 chairmen of panchayat union councils; and 98 chairmen and 2,676 ward members of municipal councils. The elections were held after a gap of more than 15 years, the ruling AIADMK having found different excuses for postponing them repeatedly – notably, natural calamities, revision of electoral rolls, proposal to introduce photo identity cards for voters, reservation of seats for women, SC and ST communities, and so on.

The electoral alliance in the local body elections were essentially the same as in the 1984 general election. The AIADMK and Congress(I) were in alliance against the DMK, CPI(M), CPI and IUML. The Janata Party had an understanding in certain places with the DMK-led front, whereas the BJP and GKNC entered the fray on their own. There were 2,717 candidates for the 626 presidentships in town panchayats; 1,439 for the 180 chairmanships of panchayats union councils; and 512 for the chairmanships and 11,098 for ward memberships at the municipal level. The election had some noteworthy features: (a) For the first time a good number of women contested the election, 266 for presidentships and

9,652 for ward memberships in the gram panchayats. (b) A total of 1,611 presidents and 73,604 ward members were elected unopposed in the gram panchayats. (c) A number of independents were successful against party candidates in the elections for posts of heads of town panchayats and panchayat union councils. And (d) the DMK-led front scored an unexpected victory against the AIADMK-led front in the town panchayats. Table 1 gives the 1986 election results partywise.

The ruling AIADMK saw an unexpected erosion from its decades-old dominance. The DMK made inroads into AIADMK strongholds in a number of districts. The DMK captured 64 municipal councils, 138 panchayat union councils and 188 town panchayats against the AIADMK's 11, 123 and 124, respectively. This was the result of the DMK's strong organisational base at the grass roots, the emergence of factionalism within the AIADMK between leaders like RM Veerappan and J Jayalalitha and, finally, the unhappiness among the general public over the AIADMK government's repeated postponement of the civic elections ever since it came to power in 1977.

NEW START IN 1996

With the enactment of the 73rd and 74th Constitutional Amendments in April 1993, a uniform and codified structure of local government was brought into effect throughout the country. Tamil Nadu was forced to fall in line and pass its own Panchayat Act in 1994. A three-tier panchayat raj system was put in place. Ward members

at all the three levels (gram panchayats, panchayat unions and district panchayats and the heads of the gram panchayats were to be elected directly by the people, while the heads of the panchayat unions and district panchayats were to be elected indirectly. In the case of urban local bodies, viz, town panchayats, municipal bodies and corporations, all the posts were to be filled by direct election. Elections to both rural and urban local bodies were held in two phases in the second and fourth weeks of October. The newly formed DMK government could thus claim to have revived local political institutions and thereby grass roots democracy after a long gap.

The number of ward members in a gram panchayat is determined on the basis of population as per the 1991 census as follows

Population	No of Members to be Elected
500-2,000	6
2,001-6,000	9
6,001-10,000	12
Above 10,000	15

A two-day poll was held to elect 1,31,532 persons to different posts in rural and urban local bodies. Elections to all posts, except those in the gram panchayats, were on party basis. A total of 76,713 candidates were in the fray for the posts other than those in the gram panchayats. The partywise break-up of the candidates was as follows: DMK 11,710, TMC 6,362, CPI 987, AIADMK 13,513, MDMK 3,485, CPI(M) 2,577, BJP 1,322, Congress(I) 2,466, PMK 1,919, Janata Dal

TABLE 1: RESULTS OF THE CIVIC ELECTIONS IN 1986

Office	AIADMK-led Front	DMK-led Front	BJP	Janata	Others	Total
Presidents of town panchayats	215	222	2	21	166	626
Chairmen of panchayat union councils	198	150	0	3	29	380
Chairmen of municipal councils	22	69	0	2	4	97

Note: Elections for two seats each in town panchayats and panchayat union councils and one in municipal councils were countermanded.

TABLE 2: CANDIDATES ELECTED UNOPPOSED IN LOCAL BODY ELECTIONS, 1996

Office	Number of Posts	Elected Un-opposed	Post for Which There Was No Nomination
Ward members of gram panchayats	97014	34756	1397
Presidents of gram panchayats	12584	868	15
Ward members of town panchayats	10173	835	4
Presidents of town panchayats	634	12	-
Ward members of panchayat unions	6504	176	-

Ward members of municipalities	102	-	-
Chairmen of municipalities	474	-	-
Ward members of corporations	6	-	-
Mayors of corporations	6	-	-
Total	131532	36804	1417

Source: *Thinamalar*, Nellore, September 19, 1996.

636, Janata Party 149; Congress(T) 9 and Samata 33. There were around 31,545 independents. More than one-third of the ward members of the gram panchayats were elected unopposed and in a number of cases elections had to be postponed because no

candidates were forthcoming (Table 2). The elections were held on October 9 and 12. Table 3 gives the polling percentage districtwise. The rural local bodies registered a little higher percentage of voter turnout than urban bodies. The voting percentage in

the gram panchayats was around 75, followed by 70 in town panchayats, 60 to 70 in municipalities, and 50 to 55 in the corporations. The rural people have thus shown greater involvement in the revival of democracy at the grass roots.

THE RESULTS

The DMK and TMC have together gained control over all the six municipal corporations, three-fourths of the municipalities and around one-half of the town panchayats. The Congress(I) which was routed in the general elections, has been further marginalised in the civic elections. The DMK-led front polled 56 per cent of the valid votes in the six corporations, followed by 26 per cent by the AIADMK-Janata Party alliance. Table 4 gives the party positions in the corporation elections. The DMK-led front secured 77.6 per cent of the total wards. In the case of elections to the chairmanships of municipalities and town panchayats too the DMK front did well, capturing 74.5 per cent and 49 per cent seats, respectively. It is interesting to note that the dominance of the DMK and TMC decreases as we move from urban to rural local bodies. Despite the setback it suffered in the civic elections, following that in the general elections six months back, the AIADMK is still clearly the alternative to the ruling DMK, especially in the rural areas.

The DMK's dominant position in local political institutions is the result of its strong organisational base at the grass roots. In the local elections in 1965, the party captured 1,654 panchayats against 6,633 by the Congress. However, in 1970 it got 3,314 panchayats and 144 panchayat unions against 2,711 and 132 seats respectively of the Congress(O). In 1986 its tally was 64 municipalities, 138 panchayat unions, and 188 town panchayats against 11, 129 and 124 respectively of the AIADMK.

Despite the AIADMK's poor performance in the civic elections, after its defeat in the general elections some months back, the AIADMK remains strong enough to challenge the DMK. Contrary to the popular impression, the party managed to more or less retain its tally in the 1986 elections. In 1986, the party, with an electoral alliance with Congress(I), was able to capture 11 municipal chairmanships against eight in 1996 without any alliance. Also, the party won in

124 town panchayats in 1986 against 84 in 1996. The mass-base of the AIADMK especially in the rural areas, is by no means to be written off.

The party to suffer the worst disaster in the civic elections is the Congress(I). The party won only one seat out of 474 in the seven corporations, 33 out of the 3,392 wards in municipalities, seven out of the 634 presidentships in town panchayats and 90 out of the 10,173 wards in them; only one seat out of 648 in district panchayats and 54 members out of 6,496 panchayat unions. The party lagged behind even newly-formed regional parties like the MDMK and PMK. The party could not get a single seat in the corporation of the capital city, in which it had captured 39 seats out of 104 in 1964 and 52 out of 120 in 1968.

The local elections outcome reaffirmed

that the anti-AIADMK wave in evidence in the general elections five months back was persisting. The civic elections have also been a step in settling the question of the succession in the DMK. Karunanidhi's son Stalin, has been elected to the topmost position in the civic bodies in the state. This issue had earlier led to a split in the party and the emergence of MDMK under the leadership of Gopalaswamy.

The civic elections also brought to the surface the tensions between the DMK and the TMC. TMC leader G K Moopanar has made no secret of his dream of reviving 'Kamaraj rule' in the state and himself emerging as Kamaraj's heir. The indirect election of the heads of panchayat union councils and district panchayats clearly indicated the tug-of-war between the two parties in many districts in the south.

Nagaland: Beyond Politics of Identity

Sanjay Sangvai

Aspiration for self-determination will continue to be the over-arching theme of Naga politics in the years to come. Yet, the politics also needs to be perceptive of the consequences of the type of development launched in the state so as to align with movements occurring in other parts of the subcontinent.

THE first thing strikes any outsider in Nagaland is the sheer beauty of the terrain – the green mountains under the vast canopy of the blue sky, the villages embracing the hillsides, and the spontaneous and decent way the people interact with each other and with you. As you stay more, it is the sense of equality, relatively more than in any part of the subcontinent except in tribal areas, among the different sections of population, and particularly, between men and women, that makes you take serious note.

The relative prosperity among the Nagas, particularly the middle and urban classes, the rampant westernisation and consumerism along with the money culture forms another aspect of the Naga reality. Scratch any thinking Naga student, or member of intelligentsia and (s)he will complain about the 'money culture that is ruining the youths and the basic socio-political values and institution of the Naga society'. The money bags and subsidy from Delhiwallahs has been dampening the entrepreneurship, the independent and self-reliant economy and the concomitant independent politics of the Nagas. The third aspect of the Naga reality is the long and arduous struggle for 'freedom' and 'self determination', which have been the central values and aspirations of Naga politics of any hue. It is but a pity that the majority of politicians, political parties, intellectuals and serious journalists prefer to ignore this aspect of Naga problem. This evasion of the basic issue of the self-determination, not only of the Nagas but of other such nationalities, has proved to be and will be counter-productive.

The Naga intellectuals or the former Naga army veterans point out that India has been the most natural ally, friend, and political, economic inspiration and shelter for Naga people. But this relation can be retained only with the recognition of the separate identity and political entity of the Naga people, they say. "Why India should spend so much money and gain nothing but enmity of the Naga people? Isn't it a losing proposition? Instead of that, India could live as a most dependable, trusted friend of Nagaland, Naga people and we too would take care of India's

strategic and political interests in the region. Let us work out some such modalities, it is not at all difficult for Nagaland to safeguard the interests of India" said general Maken, from Mokokchung area. This old, veteran leader had been the chief of Naga army for 25 years and is now trying to unite all the factions and groups fighting the Naga cause, but currently engaged in internecine feuds. Not only general Maken, but the village gomburas of the Kohima village council too think so. All of them have been Naga army veterans and have recently come 'overground'. The village head, Vimeddo, tells in terse way, "The root cause is – you Indians say *We Indians*, that means including the Nagas. We Nagas say *we Nagas and you Indians*." That sums up the entire issue.

The aspiration for self-determination has been an over-arching, and overused, theme of the Naga politics. No one, not even the most moderate and pro-India political elements, can evade this theme. The armed struggle for the Naga Republic, in the form of the National Socialist Council of Nagaland (NSCN), enjoys some support as an undercurrent and is a given reality. It is perfectly recognised that the warring factions of NSCN or other underground groups (UGs) have been harassing the common Nagas or causing uncalled for bloodshed. However, that does not make the people to believe in the army or Delhi truth that the 'secessionist' groups have been losing the base. Some of the Naga groups, particularly the student groups, have been emphasising the need for a holistic and ideological orientation for the Naga issues. Many of them are equally concerned about the rampant consumerist social and political culture and the depletion of the natural resources of Nagaland.

The continued presence of the armed forces, and the atrocities and violation of the human rights by them has been the fourth aspect of the reality in Nagaland. Apart from the visible atrocities in and outside of the custody, of which there has been no dearth, the armed forces presence has itself made life abnormal. These armed jawans, insecure though they feel in this alien land, are everywhere – in bazaars, chowks, on roads,

highways. People, particularly women and girls, feel insecure and threatened. Any time a havaladar can nab you or shoot you, make the people run for their life and dignity. The armed forces special powers act has further immunised them from the normal state administrative control, legislative and judicial accountability. The armed forces thus has been a state within state. The very presence of these forces, notwithstanding some gestures of goodwill and concern by the army and by some enlightened officials, continues to antagonise the people. An avoidable bitterness about the state, about India pervades throughout the villages, and boardrooms of the intellectuals. The armed forces and their acts of omissions and commissions further alienate the Naga people, sully the image of India in international arena and constitutes financial burden on the exchequer.

True, the Naga issue has an international context of the dominance and control by the hegemonic powers. The interference by the neighbouring countries including China and the international drug cartels had aggravated the situation. The Indian army has to deal with them. But by highlighting only the aspect of 'alien hand', the genuine aspirations of the Naga people are being neglected. The continued presence, and increasing influence and role of the armed forces in Nagaland – for that matter in the entire north-eastern region – is a matter of grave concern. Number of organisations, movements have emerged during last two decades to safeguard the fundamental human rights and campaign against the state-sponsored atrocities and violation of human rights. The India-based human rights organisations too have played their part in highlighting the human rights condition in the area. Naga People's Movement for Human Rights (NPMHR), Naga Students' Federation and other such organisations have painstakingly collected the information about the atrocities, have been demanding the right to information, filing the court cases. During last five years, an enlightened intelligentsia in and outside Nagaland has been trying to broaden the scope of the debate of the Naga self-determination with the inputs like the democracy, tolerance, participation, cultural identity, restraints on consumerism and money culture along with saving the natural resources, indigenous knowledge system. All this is still in an incipient stage though.

The response of the army and that of the government to the allegations of the human rights violations constitutes yet another aspect of the Naga political life. The armed forces maintain that they are not in Nagaland on their free will. They have been specifically

called in by the elected government of Nagaland, whatever that might be. They report to the government and move in only on specific request of the administration. As brigadier P K Singh of the army headquarters at Chakbama pointed out, the armed forces follow all the legal niceties scrupulously. When someone points out that the state government is not a legitimate body, it does not represent the Naga aspirations, the army has nothing to do with it. The Armed Forces Special Powers Act, 1972 was invoked in April 1995 on the request of the chief minister S C Jamir, who did not care to inform the cabinet, legislative assembly or for that matter the ruling party before accepting the centre's suggestion regarding invoking this act. All legitimate political processes followed the invocation of this act. Some of the ministers, for example, the minister for law, Lohe, confessed to some activists in April 1996, that the cabinet knew nothing of the invocation of such act and came to know only after CM's announcement. Thus, the armed forces were there to protect the state government and the ruling clique against the 'extortionists' undergrounds (UGs), say the ruling party members. Entire normal political process is distorted for this purpose. The interests of the ruling party, a group in Nagaland, coincide with the interests of the 'Indian' government. The army claims that they are acting on the request of the state government. The army officials also make it a point to have a dig at the state police. Why is the army called? Because the state administration and the people themselves do not believe in the police and their efficiency, told brigadier Singh.

The army nowadays strongly argues for the human rights of the personnel of the armed forces. Brigadier K V M Nair of Assam Rifles in Kohima blamed the human rights organisations of deliberately ignoring this aspect. It is a queer argument of equalising state violence with the retaliatory acts of the non-state groups. The Indian government has discovered in recent times the right to development of the third world countries to counter the arguments of the people's struggles in their own country. Similarly, the human rights of government officials is being used to smother any talk about the grave violation of the people's rights at the hands of the army.

Thirdly, the army has its own internal mechanism, its own built-in review process whereby any violation of the code of conduct is first detected, tried and is punished. This internal mechanism is far more fast, superior and efficient, the officials maintain. "We are the first to be aware of our responsibilities, the failures, as we care for our reputation", they maintain. Accordingly, Indian armed

forces contend that in Nagaland or in the north-east or even in Kashmir, they are not fighting against an enemy – but 'trying to dissuade their own countrymen, who have taken to the wrong path'. "We have our code of conduct; in north-east, every soldier has a card of the ten commandments", they would insist. The soldiers are given different sort of training and orientation. And finally, to quote armed forces officials, "We too are human beings. Army personnel are moral beings. We are doing the dirtiest job which no one could do, because we are told to do that and we are just obeying the orders. We are not satan, we too have our daughters, our emotions..."

Then there is the 'Operation Good Samaritan' whereby the armed forces are engaged in the village development work, road building and what not. In Nagaland, 'Army Development Group' (ADG) carried out many schemes. However, this good samaritan role is normally not appreciated by the village people. At the most, there is a feeling of extracting benefits, using the army. People remain sullen, fuming, recalcitrant, unco-operative.

We, in India or the *rest of India* are blissfully unaware of what was happening in Nagaland and the north-east. Our perception largely depends upon the military handouts, flashed out by news agencies in Kohima and Guwahati. That makes us think that the problem mainly lies with the 'anti-national', 'terrorist' elements. The north-east, particularly Nagaland, has assumed phantasmagoric proportions in our imaginations. The activists, professionals and common people in the towns, villages in Nagaland were overwhelmed when some people from 'India' had come to hear what they want to say, their grievances and woes. It is argued that the armed forces are necessary in such a land if normal life is to be maintained that first there should be normalcy, only then there could be dialogue. This seems to be the common thinking of the powerholders. Many organisations, prominent people in Nagaland want the withdrawal of armed forces and a political dialogue to precede any let out in the UGs' activities. Or at least, the UGs' acts could not be made an excuse to avoid the political dialogue and solution.

FUTURE NAGALAND

The first question which nags all those who empathise with the Naga cause is: what is the vision of future Nagaland in the minds of those who strive for the cause of Naga self-determination? What kind of 'development' they envisage for future Nagaland? Is it the same model of

development independent India has opted for some 50 years, which has resulted in more inequality, destruction of natural resources, indebtedness, cultural and political decadence? One could see the opulence, consumerism rampant in the lives of the middle classes and higher classes in Nagaland. The unmindful westernisation does not leave any scope for developing independent Naga cultural identity – be it in arts, attire, mindset, knowledge base or aspirations – particularly those of Naga youths. The Nagaland has become an integrated part of the consumerist India – or rather the globe and hence any talk of the identity, self-determination becomes more a management of power-sharing than a profound political ideology.

Secondly, there should be an internal critique of the social, cultural stratification, inequities, internal contradiction by the Nagas themselves. The 'identity syndrome' is presented as one monolith or given reality. No doubt, intellectuals and activists among Nagas are quite concerned about the erosion of Naga identity and cultural decadence. They are worried about the Naga youth increasingly becoming a part of the 'global' hegemonic order regarding political, cultural choices and lifestyles. Obviously, such subjugation blinds oneself towards knowledge base, science, political and social understanding, cultural values along with the natural resources of our own land and people. One is surprised to hear that fertilisers are not used in the rice fields in large parts of Nagaland, or about the kind food habits, medicines, traditional technologies, customary laws and responsibilities, work culture, participatory, decentralised yet well-knit political structures that existed in the traditional Naga society and the role of women even in the 'modern' Naga society. All these factors need to be assessed, evaluated in the present context. The people involved in Naga movement can make it a point to go to other places in India to experience the deprivation, destitution and exploitation, inequality, resource depletion there. The Naga movement or any such identity movement will have to place itself in larger context. Increased interaction between various movements, organisations in India, struggling on various issues and fronts would be beneficial for all movements. It would equip the Naga movement, whatever the aim and future course it takes to deal with the issues of the development.

[The article is based on a visit to Nagaland in April 1996 and interviews conducted during that visit. The article is not purposed to be a report on Nagaland human rights or Naga problem, which happened to be the objective of the group with whom I visited Nagaland.]

UN Conferences: A Gargantuan Waste?

V Nath

If the enormous expenditure of money and intellectual manpower in holding UN conferences at regular intervals is instead channelised in directly alleviating problems of the less developed countries, better results might accrue.

THE various agencies of the United Nations system have organised during the last decade conferences on subjects ranging from environment (Rio de Janeiro, 1994), population (Cairo, 1994), Social Summit (Copenhagen, 1995), women's problems (Beijing, 1995) to Habitat II (Istanbul, 1996). For every such conference most agencies of the UN system send their official delegations consisting of officials and experts on the various subjects to be discussed at the conference. The World Bank and often the IMF also are represented in strength: the Bank gives financial assistance for several projects to be undertaken by the less developed countries (LDCs) to alleviate various problems discussed at the conference; the IMF keeps watch on the balance of payments, implications of the expenditure, on various projects and programmes. The non-governmental organisations (NGOs) interested in the subjects of the conference hold, at the same time and place, parallel conferences to express their own viewpoint. Including the hundreds of media persons, observers and staff of the commercial firms selling equipment or providing expertise for undertaking projects to be implemented for solution of various problems, every conference is a jamboree attended by tens of thousands of persons. It is estimated that at the Beijing conference on women there were an estimated 50,000 persons from the NGOs alone.

An enormous amount of documentation is produced for every conference. The host UN agency prepares agenda papers which describe the problems to be discussed at the conference and the lines along which they could be alleviated. Most countries prepare 'country' papers which describe the problems in their country and what the government is doing to alleviate them. In addition, papers are prepared by groups of countries. Thus, the G-7 group representing the richest nations, which along with the World Bank are the principal sources of finance for projects to be undertaken for solutions of various problems, prepare papers representing their collective view. The Arab countries prepare papers expressing their particular views and reservations on various subjects because of cultural or religious

reasons. The collective view of the LDCs may be formulated after the meeting of the G-77 group.

The participants in the official conference, its various committees and subcommittees, and in the NGO's conference spend endless hours discussing various papers and formulating their views on various problems. Often there is a discussion for several hours on a paragraph in the report of a committee or subcommittee. Sometimes, placing of a comma or semicolon, including or excluding a sentence may be the subject of a discussion for an hour. After every conference various divisions of the host UN agency are engaged in preparing progress reports on the recommendations of the conference or urging the member countries to undertake policies and programmes recommended by the conference. The officials in the concerned ministries in the member governments similarly prepare progress reports on various recommendations of the conference or explaining to the UN agency their difficulties in implementing them.

It is not easy to evaluate the results of this enormous expenditure of money and intellectual manpower that holding a conference involves. The Rio conference was enormously successful. It focused the attention of the governments and citizens of the world on the problems of environmental degradation and its dangers to human life, and lines of possible solutions. In India, every project is subject to clearance by the ministry of environment to ensure that it causes minimum damage to the environment. But most conferences do not have much impact. After the conference while officials of the various ministries concerned in the participating countries would be busy preparing progress reports in implementation (or otherwise) of its recommendations, most countries continue to pursue policies and undertake projects keeping in view their own particular economic or political constraints.

Bringing together officials and non-officials of most nations of the world to deliberate on a problem of great concern to humankind is undoubtedly an enormous achievement in itself. Getting agreement on approaches to solving it or creating awareness

of its magnitude is another major accomplishment. But if after a conference most nations continue to follow policies or undertake programmes which they would have done without it, the question arises whether holding the conference is useful at all. The answer would be negative or partly positive. The negative answer would certainly apply to the two habitat conferences, held in Vancouver in 1976 and in Istanbul in 1996. The problems of providing suitable housing, adequate and safe water supply, electricity, making arrangements for disposal of solid and liquid waste, basic education and health care, or public transport which is environment friendly for the burgeoning populations of the cities of the LDCs involve such large expenditures that most city or national governments are unable to do much about them. The total aid from the developed countries, the World Bank, or the UNDP makes only a small contribution to the projects aimed at alleviating these problems. The question therefore arises: whether the finance and manpower spent in holding these conferences would not have been better utilised in undertaking the projects? This can also be said of the various population conferences which continue to be organised by the UN every few years. The first one or two conferences did create awareness of the problems of rapid increase in the population of the LDCs and outlined policies and programmes needed to alleviate them. But conducting such conferences every few years, when there is adequate information on all aspects of the problem, is a waste. The job of reviewing progress on family planning or family welfare programmes could be done by small review groups within the UN agencies concerned with similar review groups within the various governments while the money spent on holding the conference could be given by UNDP as aid to the LDCs in alleviating it. The millions spent on holding Habitat II, which was attended by about 15,000 persons, could have provided low cost housing to tens of thousands or safe drinking water to millions of the poor in the cities of the LDCs.

'Days of Action' in Toronto

Big Bang in Canada's Politics

Pierre Beaudet

Optimism is high after the massive demonstrations in defence of social rights against the neo-liberal policies pursued by the federal and provincial governments of Canada. Yet a new alternative political programme that would reunite Canada behind progressive policies remains unclear.

OCTOBER 25, 1996 was the scene of the biggest strike in Canada's history. Toronto, the largest Canadian city as well as the industrial and financial heartland of Canada, was paralysed by a labour and community-based coalition, protesting against the current policies of the provincial government, led by the right wing Conservative Party of Premier Mike Harris. The next day, the largest demonstration ever held in the country happened in the same city, bringing together 200,000 people demanding the end of neo-liberal policies, focusing on cutbacks against social services, education and health, and massive retrenchments in the private and public sectors.

These 'Days of Action', as they were defined by the organisers, were in fact the culmination of a series of events that trade unions and community groups have organised in Ontario over the last 10 months. Last Spring, massive strikes and protests were held all along the industrial triangle of southern Ontario in several industrial cities like Hamilton, London and Peterborough. At the same time, several work stoppages were organised in the public sector, as well as a major strike in the auto industry led by the militant Canadian Auto Workers Union (CAW) who dared to take on, victoriously, the three giant US auto manufacturers: General Motors, Ford and Chrysler.

According to Sam Gindin, one of the foremost labour leaders who is with CAW, "the protest in Toronto was magic. We turned a Friday into a Sunday and turned a coalition into a movement." For Gindin, the strike demonstrated a new maturity, a capacity by labour and community groups to "focus on where the real power in our society lays: the banks and private corporations. Second, we went beyond waiting for the next election, and set out to mobilise public support to defend our social rights and, through this, to build a social movement. Only politics rooted in such a broad-based movement could counter the enormous power of the economic elite."

CHALLENGE TO NEO-LIBERAL AGENDA

Although centred in Ontario, these recent developments have also penetrated the rest

of the country where neo-liberal policies are being put in place, including by the Federal government presently led by the Liberal Party. Ironically, the Liberals won the 1993 elections on the basis that it would end the previous right wing policies of the Conservative Party. But since then, the government in Ottawa has renounced past electoral promises and basically been pursuing the same priorities.

Indeed since the early 1980s, the Federal government has shifted its policies. The financialisation of the economy has been aggravated by several changes in the regulation of Canadian banks and other large financial institutions. This was supported by a systematic policy by the Bank of Canada to maintain high interest rates which, in turn, led to the skyrocketing of the national debt. Over the last two years, the five largest chartered banks increased their profits by 81 per cent. One fundamental reason for this phenomenal increase is the fact that the government's debt to the banks increased by over 500 per cent – from 15 billion dollars in 1988 to 80 billion dollars in 1995. These risk-free loans generate up to 7 billion annually in interest payments from the government – a direct transfer of income from Canadian taxpayers to the banks.

Not surprisingly, the total assets of the five largest banks have soared by 46 per cent over the past five years to the amount of 771 billion dollars – exceeding the total federal debt by over 25 per cent. At least 85 per cent of the current federal deficit, and at least 75 per cent of the growth in federal debt since 1985, are directly attributable to the dramatic and permanent rise in real interest rates that began in the early 1980s. And this drain on the public treasury is continuing, despite the current emphasis on spending restraint. For example, of all the funds that will be saved by 1996-97 from the federal government's huge cuts to public programmes, fully 85 per cent will be paid back out to financial investors, thanks to almost 9 billion dollars per year in additional interest payments.

According to Linda McQuaig, a progressive journalist and social activist,

"the Bank of Canada, in 1988, set as its goal the elimination of inflation. That may sound like a perfectly reasonable goal, since nobody, after all, likes inflation. But the truth is that the goal of eliminating inflation was in fact a very radical and dangerous policy. Essentially, the Bank of Canada turned the Canadian economy into a laboratory for an experiment that had never been conducted anywhere else in the advanced world. Since 1988, we've had the highest real interest rates of any of the G-7 nations. That has very serious consequences. What high interest rates do, essentially, is choke the economy. You can imagine money as the oxygen of the economy."

Parallel and in consequence of these changes, the Federal government as well as provincial governments particularly in Ontario and Alberta have launched a full-size assault on social spending, arguing that the state could no longer afford the cost of Keynesian-inspired programmes. Canada's social spending reached a peak of nearly 19 per cent of GDP in the depths of the 1991-93 recession, but has since dropped to about 16 per cent. It is projected to fall even further, to 14 per cent, as a result of the Liberal government's massive funding cuts – those already made and those planned in future budgets.

Conservatives like Mike Harris have been prompted to mobilise middle class support against "big government deficits caused by social programmes". Massive cutbacks in the range of several billion dollars have been inflicted on almost every social and educational programme. The result is that Toronto, the 'number one' world city according to *Forbes* magazine is now full of homeless and poor people. According to a report by a local food bank in the Greater Metro area, the proportion of adult food bank users who missed meals on a daily basis because they could not afford food rose from 15 per cent in 1995 to 35 per cent in 1996. The number of people who report having had no food for two or more days by the time they reached a food bank rose from 13 per cent in 1995 to 18 per cent in 1996. In the meantime, employers are asking for more 'downsizing' of government, deregulation and further integration of the economy into the larger North American market. One of their argument is that Canada cannot compete with the US if it does not lower its standards to fit the US 'model'. Historically, government transfers in Canada have been largely responsible for the fact that during the 1980s, unlike in the US and the UK, income inequality increased only slightly, even though the market distribution of income became much more unequal (in 1981 the richest 20 per cent of Canadians received about 12 times as much market income as the poorest 20 per cent,

and in 1992 they received over 22 times as much).

NEW POLITICS?

The events of Toronto clearly show that resistance to neo-liberal policies is high and increasing. However, what remains unclear is the capacity of labour and community groups to propose alternatives. Historically, the political party associated with labour was the centre-left New Democratic Party (NDP), which never held office in Ottawa but was elected in several provinces including Ontario in the early 1990s. But currently, the NDP is at a loss. Its social base is angry about what it perceived as a lack of focus and an inability to confront neo-liberalism when they are in public office. Secondly, the NDP has been unable to come up with innovative proposals concerning the crisis of national unity which has erupted once again since the 1995 Quebec referendum, which came close to breaking the country apart. Quebec's national aspirations have never been incorporated in the political culture of the NDP (nor for that matter in the more radical factions of the Canadian left). In return, Quebec nationalism which started from a left populist perspective has evolved towards the right, aiming at persuading the US that a break-up of Canada could be beneficial to Washington.

In the meantime, neo-liberal policies are accentuating the crisis since their direct impact is to diminish, just as in pre-breakdown Yugoslavia, the role of the state as a re-distributor of national wealth and as a regulator of national policies, thus leaving the regions and the provinces in a situation where they are more and more left to themselves to maintain minimum social and economic standards. Behind that drift is the pressure of the Canadian financial establishment, which is flirting with the idea of dissolving the Canadian state and fully integrating into the US, as explained earlier.

Unless Canadian labour is able to redress that situation, it is likely that resistance to neo-liberalism will remain reactive. The alternative is to build, within or without the NDP, a new political programme that would reunite Canada behind progressive policies, including the recognition of Quebec national aspirations and demands, but within the confines of a Canadian independent (read anti-US) platform.

Certainly, the upheaval in Ontario is leading to these questions. As usual, struggle brings new ideas and perspectives. As Sam Gindin explains, "What excites us now is the discovery of our organisational potentials, the links we are making, and the growing confidence of our activists. What keeps us going is seeing the large number of new people who were touched enough by what

was happening to break out and come to their very first protest. What we looked to was our impact on broadening the debate on the issues and in framing how that debate took place. For us, the Days of Action politicised our communities and thereby

democratised politics. The Toronto events didn't just bring thousands of additional pickets and marchers, it brought a new generation of activists full of the energy and creativity we desperately needed. They brought hope."

Israel: The Dilemmas of Growth

Frederic F Clairmont

The massive capital inflow under the garb of 'economic aid' into Israel is inseparable from Israel's political linkages with the US. These inflows have contributed to a huge disparity between Israel and the rest of the west Asia, and are feeding the roots of Arab nationalism.

THE growth of Israel's economy over the last decade has been impressive. What is its likely trajectory to the end of the century? What are the foundations of that growth given the present unsolved problems that bedevils Israel's political existence? The foundations of Israel's economy repose on the relentless inflows of billions of US dollars, both public and private; the existence of a Palestinian labour exploited at a subsistence wage and the sustained expropriation of Arab lands. To this must be added uninhibited access to the US market.

The economy grew 7 per cent in 1995. Its per capita income is around 16,500 dollars and is expected to hit 20,000 dollars by the turn of the century. A number that would catapult it into the ranks of many of Europe's developed economies. The aggregate figure is highly misleading given the monstrous income disparities between Jew and Arab within Israel, and among Jews themselves. In that respect Israel is far from being a homogeneous people. The pace of centralisation and concentration of capital – already high – is rising rapidly.

Turning to the West Bank and the Gaza Strip, we perceive that the per capita is around 1,100 dollars. What we are seeing is the persistent image of South Africa's economy in the pre-apartheid era. The Palestinians as the builders and farm workers that were responsible for the so-called 'economic miracle' have been utterly marginalised in the development process. They produce the cake but rarely eat it. Their subsistence purchasing power limits the growth of the domestic economy, and dramatises the marked duality within the economy. Can the Israeli economy continue to prosper under these conditions and if so for how long? That seems highly dubious.

Israel is already – and not merely in military hardware – an advanced industrial economy. The claim by some of its technocrats that it is the only economy in the world that can

advance into the post-industrial information age without having gone through the phase of a conventional industrial revolution is a valid one inasmuch as it is not freighted down with aging and obsolescent industries. This argument requires many caveats and is beyond the scope of the present contribution.

The statement is true of the hi-tech sector which has become a rival of California's Silicon Valley, notably in telecommunications equipment. The interdependence of Wall Street and Israel, indeed its addiction, is seen in the capital flows from the Mecca of American finance capital. Billions of dollars have poured into all sectors of the Israeli economy and that too, independent of economic 'aid'. In the past six months of 1996 alone, Israeli companies raised almost 1 billion dollars of new investment, four-fifths coming from Wall Street.

In 1995, it pulled in over 2 billion dollars, triple that of 1994. By any standards these are world breaking records on a per capita basis. Certainly, no other West Asia country could approach this figure. Obviously, these inflows are inseparable from its political linkages with US finance capital, its major feeding grounds as well as the ebullience of US financial markets in recent years. These inflows have been translated into impressive GDP growth rates. This has contributed to a huge disparity between Israel and the rest of west Asia. The social and political ramifications of this huge divide are also feeding the roots of Arab nationalism.

The ramifications of this prodigious economic power is that by 1997 around 100 Israeli corporations will be listed on Wall Street. These companies, primarily hi-tech, will be second only to Canada in foreign stocks traded in New York financial markets.

Such growth is not an autonomous process; it is predicated on political stability and support of the Israeli bourgeoisie, which stands opposed to Netanyahu's political

course. Only by stability – and that means peace with the Arabs and the equitable solution of the Palestinian problem – will there be markets for its rising output of manufactured goods. The contradiction here is not simply between Jew and Arab but within the class forces in Israel and their relationship to the world market.

The attempt – so far successful – of stalling development in Palestinian areas by withholding economic aid has not worked to Israel's advantage. Where are the promised cash flows that were supposed to have flowed into Palestine following the Oslo deal? Indeed, the Palestinian autonomous group is penniless. Attempts to put money into this group were stymied by the powerful Jewish lobby in the US Congress.

Israeli public relations ballyhoo has always promoted the rhetoric and the image of little David defending himself against the Arab Goliath. This is a vulgar falsification of the historical record. No country at any time in history has received such massive inflows of 'economic aid'. Over the last 40 years it has received yearly 3 billion dollars of official US 'aid'. To this must be added the sum of two billion dollars from private international Jewry. That's 5 billion dollars. Israel's population is around six million. The US government alone provides Israel with 3 billion dollars in economic and military aid. That's not all the dollar juice flowing into coffers. In addition, the US provides Israel with 2 billion dollars of loan guarantees a year. Many of these loans will never be repaid. That means the American taxpayer will be footing the bill.

Over a 40-year span it has received gifts, donations and reparations (notably from Germany) of over 230 billion dollars. Compare this with the trifling sums of Soviet aid to Cuba that amounted to 2 million dollars a year now being repaid with interest. What we are seeing is that the Marshall Plan which amounted to 20 billion dollars (and that too was repaid with interest) was small beer by comparison. There is something even more invidious in the granting of this aid that puts Israel on the permanent gravy train.

Clinton is savaging the welfare state that was set up by the New Deal administration to help lift the American people out of poverty and deprivation. There is absolute consensus in the Dole/Clinton cabal that it should be aborted. And so it is. Have these austerity cuts affected the massive economic handouts to Israel? No way. Sacred cows cannot be touched. Such is the course of financial profligacy pursued by the present tenant and his predecessors in the White House and the political caste oligarchy that dominates the US Congress.

The pro-Israeli lobby is the biggest on Capitol Hill (trailed by Taiwan) and by far the best funded. No Congressman in his

right senses would cross swords with that mightiest of lobbies because he would simply, and immediately, be axed. Senator Alfonse d'Amato, one of the most vociferous hustlers of that lobby, and who has been re-elected thanks to its greased benefactions, understands well the meaning of power. It must be emphasised that there is not one Jewish lobby but dozens; but the most important is the American Israel Public Aid Committee (AIPAC) which has been the prime mover of US aid in Congress.

AIPAC's new executive director is a Republican of impeccable financial 'free market' connections. He represents the highest powers of corporate America (*The Wall Street Journal*, August 9-10, 1996). Israel in short is a multi-billion dollar welfare state recipient, paid for by the American tax payer. And this at a time when 30 per cent of the American people are living below the poverty line. And let us not even talk of the tens of millions living in the rotting urban ghettos.

Why then is the money not forthcoming to rebuild the ghettos? Those bold spirits that raise this burning issue are immediately branded as anti-semites, an expletive shoved at those critics that have the audacity to question the magnitude of such aid at such a critical juncture of poverty-stricken America.

The comic irony of all this is that Netanyahu is calling for a reduction of this aid in a speech he made to Congress. It was no doubt intended as a public relations joke, but AIPAC did not see it that way. Its protagonists contend that the aid should be maintained and that military aid should be boosted. No doubt, the little verbal game will continue to the benefit of Israeli capitalism. In the last analysis, however, what will determine the fate of Israel and its economy is not the size of the aid package but its capacity to live with its neighbours: to live and let live. An attitude so far singularly absent in its twisted racist political vision.

Administration, Decentralisation and Good Governance

D Bandyopadhyay

We have a fairly sound format of good governance in an active parliament and state legislatures, an independent judiciary, free print media, a constitutionally guaranteed system of decentralisation and a small but growing and vigilant civil society. But, on the other hand, the values which are at the foundation of our republic are under assault through the process of liberalisation. Unless we reorient our economic and social policies on the basis of the principles enshrined in the Constitution, we may not have the substance of good governance.

I COMMENT the concept of 'good governance' in its simple English meaning. But I have a strong objection to the term as it is being touted in the recent years by multilateral and bilateral aid agencies as a part of precondition of aid or as a process of reform as conditions of aid. It is becoming an in-thing in recent development literature assiduously crafted and hawked by the north either to deny aid or to use it as leverage in securing changes in the system of governance in the aid receiving countries. The World Bank and the OECD have become great proponents of this concept. The World Bank has identified three distinct aspects of governance: (i) the form of political regime; (ii) the process by which authority is exercised in the management of a country's economic and social resources for development; and (iii) the capacity of governments to design, formulate and implement policies and discharge functions. The OECD uses the World Bank definition of governance with the following links: legitimacy of government (degree of democratisation), accountability of political and official elements of government (media freedom, transparent decision-making, accountability mechanisms), competence of governments to formulate policies and deliver services, and respect for human rights and rule of law (individual and group rights and security, framework for economic and social activity, and participation).¹ One is touched by the mock modesty of the Bank document when it states that as its charter prohibits, it does not look into the form of political regime as if by manipulating the other two elements, it does not subvert the first, but the OECD which consists of the old imperial powers does not have any such compunctions. With all their commitment to legitimacy of governance and human rights et al, most of the aid was directed towards strategic allies in the cold war, to many authoritarian

regimes, to many high military spenders. Even today, two-and-a-half times as much per capita ODA goes to high military spenders as to low military spenders. Even today, strategic allies get preference over poor nations, for example, El Salvador receives 16 times as much US ODA per poor person as does Bangladesh even though Bangladesh is five times poorer.² Isn't this a fine example of the north's sophisticated hypocrisy and subtle double-speak? The term 'good governance' as it is being used today by the north has become the symbol of recolonisation and new Imperialism.

Where was this concept, if one may ask very politely, when African men, women and children were hunted and captured like wild animals and shackled and marched off in thousands to be sold as domestic work animals in the slave markets of the north not so long ago? Where was this noble idea when through overt and covert piracy treasures were shipped from Latin America and Asia to build the new industrial civilisation of the north? No one hears even a whisper of repentance or remorse of this great international pillage and robbery from the metropolitan powers which sucked the colonies dry through naked, shameless, direct and brutal exploitation to attain the stage of development they have achieved today. I also do not want to hear about 'social clauses' to be attached to international trade from those who built their present affluence on the basis of slave labour or indentured labour and by extracting surpluses by means most foul from the nations of the south. My plea is, please keep your counsel to yourself and ameliorate the conditions of your own citizens who are suffering from chronic unemployment, falling income, homelessness, poverty and other associated social disorder.

This does not, however, mean exoneration of our elected rulers and their minions who have been, particularly during the last five

years, running a system of malfeasance and misgovernance by plundering and swindling public funds for private gain. The *Economic Times* of September 17, 1996 published some figures of swindling of public funds so far unearthed during the Rao regime. The figures come to somewhere near Rs 10,000 crore. Knowledgeable persons think it is a gross underestimate. We are not debating here about the correctness of any absolute figures of felony and larceny which are in any case astronomical and beyond the comprehension of ordinary men and women. But the magnitude of this systematic fraud, deceit, chicanery, embezzlement and theft is shocking and makes one feel sick. Both the perpetrators of these horrendous crimes and the degenerate system which allowed these to happen should be thrown into the dung heap of history. No mercy should be shown. No quarters should be given. Pitiless justice should remove them from the public view. We the citizens of this country who are the victims of this malgovernance should come together to establish a system of good governance through democratic process and rule of law so that we may not suffer again. This is our own problem which we have to sort out ourselves in our own way. We reject with disdain the 'futwa' of OECD and deplore any 'policy dialogues' of the Bretton Woods twins on this issue.

Even at the cost of slight repetition I would like to state my view about governance. Obviously, governance is wider than government, though government because it is the most powerful and coercive institution continues to be the major element of any system of governance. But in the era of privatisation, free market, contracting out, structural adjustment, decentralisation, restructuring, deregulation, sustainable development, empowerment; formulation and implementation of public policy seem increasingly to be undertaken by non-government institutions. Thus non-government organisations are becoming increasingly important elements in the governance with the retreat of the dirigisme. The third element in the governance is the corporate sector which includes both the national and transnational corporations. With the withdrawal of the state from the economic arena, the space is filled up by the corporate sector which wields enormous economic power affecting life, living and well-being of the masses. Transnational corporations have grown in size, number and power beyond comprehension in recent years. The significant and powerful among them are larger in net worth, annual income and even population than several member-nations of the UN. These corporations in much of their activity are beyond the reach of nation states;

indeed this freedom, autonomy or 'anarchy' is the distinguishing feature of multinational corporations. These corporations are the main actors in the world economy, they straddle national boundaries and the larger among them have sales which exceed aggregate output of many countries.¹ To talk of good governance means bringing about goodness in all the three sectors: government, civil society and corporate sector including transnational corporations. Is it possible?

THE BUREAUCRACY

Let us start from where it is possible, that is the government. If we can set our own house in order, there is a chance or a remote possibility of influencing the activities of the other two sectors. In the government one has to deal both with the structure and the bureaucracy. Elected political masters, good or bad, are either politically punished or rewarded through the process of elections which so far has been regular in our country. But the bureaucracy being permanent, its benign or malignant influence becomes long lasting and pervasive. While speaking about bureaucracy one cannot help quoting Winston Churchill's description of it: "Bureaucracy is a riddle wrapped in a mystery inside an enigma".

As an unrepentant bureaucrat of 35 years' vintage one may think that my views on the Indian bureaucracy would have an institutional bias. But being out of it for quite some time I now have both an insider and an outsider view of the system which I think would make my views fairly balanced. The Indian bureaucracy modelled on the British system is a body of generalist professionals which was expected to be efficient, disciplined, diligent, honest, fearless and politically neutral. In return the Constitution gave security of service and the public at large had a good opinion of members of senior services which enhanced the social standing and prestige of their individual members. Barring a few stray aberrations of individual nature, the bureaucracy acquitted itself well in the first two-and-a-half decades after independence. After 1967 when one-party rule ended in many states and the 'opposition' came to power, it took hardly any time for new political masters to establish a healthy and friendly working relationship with the bureaucracy and the bureaucracy did not find any difficulty to adjust itself to the new policy regime.

The civil services faced a real crisis during the internal emergency in the mid-1970s. It left a lasting adverse impact on the bureaucracy. During the emergency an intense fear psychosis shrouded the bureaucracy. Any difference of opinion was looked upon with suspicion. Any dissent was interpreted as an anti-state action. Sardar Patel tried to put the fear of God into the minds of the civil servants to make them fearless to men. In contrast during the

emergency fear paralysed the conscience of civil servants. Normal checks and balances including the fear of exposure in the media in an open society were stymied. Quite a few buckled in. A few resisted. Many not on the direct line of pressure escaped unscathed. But in some, shorn of the normal restraining factors of an open society, the suppressed buccaneering urge showed up with its ugly primeval aggressiveness. These were the 'heroes' of the emergency. They violated all the canons of decency and civilised code of conduct and trampled with the rule of law with impunity. They prospered then. The tragedy was that they flourished even later. That set in the process of corrosion of moral fibre of the Indian bureaucracy. The strong and the determined ignored it, and continued as before. But many timid and faint hearted continued to be fearful even after the emergency was lifted. A weak bureaucracy is a handy tool for an amoral political system. And no determined efforts were made to stiffen the moral fibre of the bureaucracy thereafter. Some efforts were made during Rajiv Gandhi's time through compulsory training of all members of the superior civil services. But the approach was basically technocratic and not ethico-legal. It did not have any lasting impact.

Notwithstanding this the bureaucracy in India stands committed to a set of values enshrined in the Constitution. By swearing allegiance to the Constitution of India, civil servants individually and collectively are both duty-bound and honour-bound to uphold, preserve and protect the sovereignty and the secular, socialist and democratic character of the republic of ours. On the same logic they are mandated to secure to all its citizens justice social, economic and political, liberty of thought, expression, belief, faith and worship, equality of status and of opportunity and fraternity assuring the dignity of the individual and the unity and integrity of the nation.

The whole set of values for which the bureaucracy stands committed is under the threat of displacement in the name of liberalisation. That's why an ethical crisis is developing in the bureaucracy now. The objective of the good governance in India was set by Pandit Nehru in his soul-stirring speech in the midnight of August 14-15, 1947. It was "ending of poverty and ignorance and disease and inequality of opportunity". Mahatma Gandhi also prescribed a set of stiff yardsticks for judging the efficacy of public policies in a system of good governance. He said "Will it restore to him (the poorest and the weakest man) control over his own life and destiny? In other words will it lead to Swaraj for the hungry and spiritually starving millions?" To achieve these objectives we have the Directive Principles of State Policy in the Constitution, which are not justiciable but nonetheless are fundamental to the governance of the country.

The policies of economic reforms pursued by the central government since mid-1991 are often repugnant to Directive Principles of State Policy. A news item dated Washington, September 21, 1996 (published in the *Statesman*, Calcutta, on September 22, 1996) states India will be upbraided in the forthcoming Fund-Bank annual meeting, among other things, for its failure to "adopt an exit policy". Exit policy is totally repugnant to "right to an adequate means of livelihood" which the state is mandated to secure under clause (a) of Article 39. The Fund/Bank dictated Structural Adjustment Programme which mandates opening up of the economy and liberalisation has universally led to increasing concentration of wealth, income and economic power, dominance of multinational corporation in the domestic economy, accentuation inequality of income and asset holding and sharp deterioration of Human Development indicators. Human Development Report 1996 in the Box 2.7 captioned 'Liberalisation and Inequality' states: "Income inequality is clearly on the rise in many countries that have opened up. In 1970 income inequality was fairly low in Sri Lanka: the Gini coefficient was 0.35. When the country began to liberalise its economy in the late 1970s, the inequality rose dramatically. By 1990 Gini coefficient was 0.51 – an increase of almost half". Gini coefficient has moved adversely in China, Mexico and Chile. Clause (c) of Article 39 mandates that "the operation of the economic system does not result in the concentration of wealth and means of production". The policies pursued by the government of India in this regard are totally contrary to what the Directive Principles mandate. It is not a case of deviation from the ethics of public policy determination. It is a clear case of violation of the basic principles of ordering our economic system as enshrined in the Constitution. The better among the bureaucracy are in moral confusion, the worse among them are making hay while the sun of liberalisation shines. In either case the casualty is good governance. The situation can be described by a medieval English limerick about the enclosure of the village commons by the nobles.⁴

The law locks up both man and woman
Who steals the goose from off the common,
But lets the greater felon loose
Who steals the common from the goose.

If one examined the structure of the Indian administration prior to the 73rd and 74th Amendments, one would be struck by two contradictory situations. At the central level and at the state level there is vibrant democracy with the parliament and the state legislatures enforcing accountability of the executive and demanding information through parliamentary interpellations and debates. The organisations are so vast and complex and operate in such a cloak of secrecy and cover that the desired degree

of transparency and accountability cannot be assured in all the cases. But, by and large, on any major issues political executives and through them the bureaucracy can be held accountable. But if one looked below the state level there was a total authoritarian system run entirely by the bureaucracy. That is one side. On the other, through enormous economic powers vested in the centre, over the years there had been a tremendous accretion of powers at the centre. Today there is far too much power at the centre; a great deal more than necessary in the states and virtually none at the local level where the people are. This disjunction between power and the people is at the root of the many ills of this polity.

Some of the main attributes of 'good governance' are accountability, both financial and political, transparency, easy access to information, popular participation in decision-making and implementation, responsiveness, efficient delivery system of services and goods, enforcement of rule of law supplanting the rule of whims and caprices of rulers whether stipendiary or elected, client/citizen satisfaction and an overall caring and humane ambience promoting an egalitarian and equitable social and economic order.

The system of bureaucratic administration below the state level singularly fails to satisfy most of these criteria. The search for an alternative to the 'steel frame' or the 'pig-iron frame' started shortly after independence but it was not done seriously because the existing system of bureaucratic administration served the interest of the new masters very well as it did the imperial overlords. I am not going into history. It is well known. There were stray cases of success of decentralised governance in some states but its overall impact on the Indian administrative system below the state level was not very telling. Rajiv Gandhi started a serious exercise to ensure that benefits of rural development reached the target group. His continuous tour of rural India and his direct talk and contact with the rural people, ethnic and minority groups brought about the realisation that something essential was missing in the vast administrative structure at the district level and below. That missing element was responsiveness. This lack of responsiveness was due to absence of accountability of the bureaucracy to the people it was to serve. Rajiv Gandhi found that while the civil services had the finest brains and the best administrative ability of the country, "the experience of the vast majority of our people at the grass roots has been that at the interface between the people and administration, the administration is unresponsive, inefficient, unsympathetic, often callous, sometimes even cruel to those whom they are meant to serve". It became clear that the underlying problem was not so much a matter of simplifying procedures

or establishing a grievance redressal machinery but fundamentally of a systemic nature. It became apparent that "if our district administration is not sufficiently responsive, the basic reason is that it is not sufficiently representative."³

THIRD TIER OF GOVERNANCE

The central and the state governments are far removed from the masses. The bureaucratic district administration by its very nature got isolated from the people, "thus dulling its sensitivity to the needs of the people". Hence a fundamental change was called for. There had to be a third tier of representative governance at the district level and below to make the democracy real to the rural masses where power would be exercised within the visibility of the people and those who exercised power would be accountable to them. Downward accountability would make the system responsive. The present chasm between few elected representatives like MPs and MLAs and the bureaucratic district administration and the vast masses was conveniently filled by power brokers, the middlemen, the vested interests. "The power brokers have established their vise-like grip only because democracy has not functioned at the grass roots. Once the people have their own elected representatives from electorates as small as a hundred to five hundred persons, the source of power will lie only as far away as the panchayat ghar, not some distant state capital or even more distant capital of the country."⁴

The 73rd and 74th Amendments did bring about a third tier of representative governance at the district level and below. I am not going to discuss the details. The 73rd Amendment has the potential of establishing at least the procedural part of good governance. The decentralised system of elected governance has certain inherent advantages. "One is efficiency: decision-makers who live locally are likely to know more about local conditions, they should be able to match resources and needs more precisely. Another is accountability: when decision-makers live and work in close contact with users, they are exposed to more effective scrutiny and are under greater pressure to deliver the goods. There are also more opportunities for local people to participate in planning services and to pay for them through local taxes. Experience also shows that local governments tend to give higher priority than central governments to human development." In India the last point has a greater significance because of reservation of not less than one-third seats and elected offices for women and for SCs, STs and OBCs in proportion of their population to the total population. Adequate representation of women and dalits is going to make a qualitative change in the functioning of panchayats. I do not buy the usual male chauvinistic cynicism that women are mere

proxies. There may be some cases of such proxy functioning but once women taste power they would assert their independence as is evident in many cases in West Bengal. The other fear is that in the absence of land reform and with the existing inequalitarian asset and wealth distribution, it might empower the powerful. While not discounting the possibility, with regular election and performance audit by the electorate the existing powerful would lose power and the transfer of power would take place.

It is not to be understood the panchayat provides panacea for all the evils of misgovernance. I would only assert that they have the potential for good governance at the local level provided they are institutionally, legally and financially supported by the existing power structure. But here lies the catch.

The 73rd Amendment defines panchayats as institutions of self-government. Article 243G which empowers the state legislature to endow powers and authority to panchayat clearly states that such endowment should "enable them to function as institutions of self-government". The concept of 'self-government' is not negotiable. Unfortunately this concept of self-government with its concomitant attributes are either not fully understood or very dimly appreciated. A study conducted by the Task Force on Panchayat of the Rajiv Gandhi Foundation noticed with grave concern that this basic ideology had been largely ignored in the recent state legislation. Hence it is necessary that all sections in such legislation which militate against this overarching objectives should be deleted or properly amended to make panchayats genuine institutions of participatory self-governments.

Panchayats cannot develop as genuine units of self-government without a drastic reduction and restructuring of central and state government apparatus especially in respect of items included in the XI Schedule. Stripping this enormous administrative structure of its overburden and shedding the excessive concentration of power at higher levels are essential prerequisites for the empowerment of the panchayats. The central government should immediately start an exercise to reduce its size and powers. To accelerate this process it should constitute a high power committee consisting of experienced and panchayat-friendly persons to give a report on the subject within a specified time frame. Principles accepted for restructuring of the central government should apply *mutatis mutandis* to the state government.

Some of the state Acts have made a mockery of allocation of power and authority to different tiers of panchayat. Some Acts have just reprinted the Eleventh Schedule for each tier. Some Acts have given the authority to the executive to delegate such power and authority to different tiers. One

BUSINESS COMMUNICATION TODAY

SUSHIL BAHL

The communication revolution that the world is witnessing has had a very significant impact on the workplace in recent years. Sushil Bahl draws upon his experience in advertising and corporate communication to relate these major developments to the Indian context. Written in an engaging style, this book provides a comprehensive and practical presentation of the basics of communication for achieving success in the workplace.

100 METHODS FOR TOTAL QUALITY MANAGEMENT

GOPAL K KANJI and MIKE ASHER

The 100 methods presented in this book all relate to the implementation of the philosophy and practice of total quality management (TQM) in organizations. The book includes both qualitative and quantitative tools to assist problem-solving, analysis and evaluation to aid the implementation of TQM.

244 pages ● Rs 195 (paper) ● 1996

NOW NOT TO RUIN YOUR SMALL INDUSTRY

S J PHANSALKAR

Designed to help small-scale entrepreneurs successfully build strong organizations in the changed environment, the book identifies some of the most common mistakes made in the small-scale sector. Written in a direct and enjoyable style, the book provides practical suggestions on how to diagnose, forecast and arrive at a solution to these problems.

196 pages ● Rs 325 (cloth) ● Rs 145 (paper) ● 1996

BEYOND THE URUGUAY ROUND: THE INDIAN PERSPECTIVE ON GATT

BIBEK DEBROY

The final Uruguay Round agreement as well as the Dunkel Draft that preceded it have generated considerable debate in India. Written in a lucid and reader-friendly manner and assuming no technical background of the subject, this book looks beyond the debate while demystifying the provisions of GATT.

224 pages ● Rs 325 (cloth) ● Rs 195 (paper)

STEERING BUSINESS TOWARD SUSTAINABILITY

edited by FRITJOF CAPRA
and GUNTER PAULI

Business activities are responsible, directly or indirectly, for most human impacts on the earth's ecosystems. Yet business is generally conducted with little regard to its sustainability. This book seeks to steer the business community towards 'greener' industrial practices that are also profitable.

or two Acts made a serious exercise in this regard. But actual devolution of financial, executive and legal authority and power to make the panchayats genuine institutions of self-government is yet to take place. The basic principles of allocation of powers and function among the centre, state and the three tiers of panchayats should be that what can be done at the lower level must necessarily be done at that level and not at a higher level. From another angle, one could devise a 'minimum needs' package for the centre and the states, the rest going to different tiers of panchayats. In a more restrictive way, the centre and the state should exercise only residual powers in respect of items included in the Eleventh Schedule.

Another point in this connection is that the Eleventh Schedule really indicates the floor. States can give much more. In fact the original and traditional functions of panchayats to resolve disputes has not been mentioned at all. At lower tiers of governance such powers of both criminal and civil nature should be given to them without further delay.

While accepting and welcoming the Planning Commission's role (though severely curtailed under the principle 'let the market decide') in setting national priorities and broad investment patterns in consultation with the states and the centre, the need for decentralised planning cannot be overemphasised. District-level schemes should be sponsored by the village or intermediate or district panchayats. These should not be handed over to them from above. Panchayats at these levels should have a reasonable percentage of Plan funds and other financial resources which should be totally untied so that they can use these resources on the basis of their own priorities and choice. If the central government were serious about devolution, we would like to see this principle clearly incorporated in the Ninth Plan now under preparation.

There are a large number of central and state Acts, regulations and subordinate legislation which militate against the required devolution of powers and functions to the panchayats. All these points require to be properly identified for remedial action by the central and the state governments. The Law Commission or a similar body of experts should be entrusted to do this job urgently.

While the Planning Commission is neither a constitutional nor a legal body, the 73rd Amendment has given a constitutional duty on the panchayats for the "preparation of plans for economic development and social justice". The point to note is that the panchayat cannot prepare any plan for economic development which does not ensure social justice. The concept of economic development through social justice has got constitutional recognition only in respect of the panchayats. The central government, it looks, is free to pursue economic policies which increase poverty,

accentuates concentration of wealth and income – which the five years of economic reform has already done. Rural poverty ratio had increased by nearly 8 percentile points in the first two years of reform. Significant deterioration has taken place in the consumption share of individuals both in the lowest three and middle four deciles of population at the gain of top three deciles since 1990-91. We have a larger pool of unemployed persons at the end of the Eighth Plan than at the beginning. Real wages in agriculture showed a significant decline and even became negative for the skilled labour." To cure these ills created through the reforms package, the prime minister declared on August 15, 1996 that central government would spend Rs 60,000 crore for rural development. How would government do so without a whopping increase in the fiscal deficit is a matter for government to decide. But my simple question is why do you pursue a policy which results in mal-governance and then try to cure the evil effects under electoral compulsion by spending astronomical sums, thereby creating more problems for fiscal adjustment.

There is another point before I close this issue. To curry favour with the MPs, the Rao government introduced a pernicious practice of granting rupees one crore to each MP annually for so-called local area development. It adversely affects the viability of the panchayat system. To strengthen the third tier of governance the central government should immediately stop this practice and give one crore of untied fund to each zilla parishad annually for the same purpose. It would show the central government's commitment to the panchayat system.

The 73rd Amendment does provide a fine format for good governance for the rural masses but it is doubtful how is it going to develop. Concerted popular movement is necessary for empowerment of the panchayat because the entrenched interests would not like to part with their existing power. International experience also indicates that. The *Human Development Report 1996* comments: "But a more general brake on decentralisation is that central governments have been reluctant to release to the local level either funds or decision-making power".

I shall not dwell much on the governance role of the non-government organisations (NGO) and community groups currently called the civil society. Such organisations do render valuable supplemental services to government efforts by extending them to people or groups who would otherwise remain unserved. In our country Christian missionaries and the Ramkrishna Mission have been doing excellent service in spreading education and rendering health services in remote and distant regions among equally isolated tribal groups long before any government agencies thought of moving

into these areas. Even now the presence of government agencies in many such difficult areas is either non-existent or very thin. These organisations also play a vital advocacy role, mobilising public opinion and community action and help shaping human development priorities.¹⁰ In fighting oppression and injustice and exposing misdeeds of authorities, non-governmental organisations have been playing a significant role both in our country and abroad. The threat is that governments tend to co-opt them both internally and externally. There are instances of such co-opted organisations, though not many in number, working not only for the national government but also for foreign governments. Barring a few such organisations and a few corrupt bodies, the role of the NGOs in governance has been very positive.

CORPORATE SECTOR

The corporate sector is a more difficult area. It is nice to see that the corporate sector in India has become quite conscious of internal 'good governance'. The confederation of Indian industries has taken a lead and circulated a draft proposal entitled 'Corporate Governance'. What it is talking about is improvement of corporate management through greater degree of professionalism.¹¹ Certainly, well run corporations would have much less evil effects on the society with their respect for tax law, concern for environment and all that. But these are really not the major issues. The main issue is, could the private sector corporate goal of maximising profit be harmonised with public good. Could there be a matching of private interests of business organisations with public interest. On a purely theoretical plane, in a situation of perfect competition there could be such matching. But it would happen only in an Utopia. It is like the last stage in communism when the state withers away as all class conflicts cease making the state redundant. In reality we have distorted markets dominated by oligopolies or monopolies. Cartels, syndicates, trusts and conglomerates now determine the structure of the economy. In the corporate sector we have the slogan that what is good for General Motors is good for the country and since that country dominates the world economy it is good for the humankind. Obviously, in such a situation there would be a serious mismatch between the private interest of the corporate sector and the public interest.

With the gradual withdrawal of the Indian state from the economic arena on the ground of liberalisation, privatisation, deregulation, decontrol et al, the space vacated is being occupied increasingly by the corporate sector. It is not millions of small firms with more or less equal strength jostling among themselves in fierce competition to occupy the vacant space. It is the giant national

corporations and business houses who have already established themselves on the commanding heights with the giant TNCs either making entry or waiting for suitable moment for wholesale take-over. Since the liberalisation the executives of the Indian state, to quote Marx and Engels, have been behaving like "a committee for managing the common affairs of the whole bourgeoisie".

Public interest is not going to be served in such a situation. The mainstream economists and the liberalisers who claim to be the intellectual heirs of Adam Smith might pause for a while and ponder on what Adam Smith said on policy advice from businessmen.¹²

The proposal of any new law or regulation of commerce which comes from this order, ought always to be listened to with great precaution, and ought never to be adopted till after having been long and carefully examined, not only with the most scrupulous, but with the most suspicious attention. It comes from an order of men whose interest is never exactly the same with that of the public, who have generally an interest to deceive and even to oppress the public, and who accordingly have, upon many occasions, both deceived and oppressed it. (Adam Smith, *Wealth of Nations*, Book I, p 211.) Could it be that the public in India is being subjected to just the sort of deceit and oppression that prompted Adam Smith's warning? I only raise the question. I refrain from giving any answer.

Since liberalisation the Indian government has been bending over backwards in its attempt to woo multinationals. There is a stiff competition among states to get TNCs located in their respective territories. There is an enormous volume of literature on transnational corporations (TNCs). The UN Library on Transnational Corporations has published 20 volumes collecting articles, papers and document from all over the world. There is an enormous bank of knowledge and information about what TNCs are, what they had done, and what they are up to. Perceptions differ depending on which side one is. Henry Kissinger thinks TNCs are engines of development. Lawrence Alschuler describes them as instruments of mal-development. Writing about the interface between TNCs and developing states Raymond Vernon, another authority on TNCs, states, "suddenly, it seems the sovereign states are feeling naked". Manmohan Singh, the former finance minister, in his first regular budget speech while inviting direct foreign investment said that he was not afraid of the East India Company. Singh is an erudite person. One has to take his words seriously. With the impressive recent historical record of cases in which the parent authorities have intervened against host countries whose domestic agenda included strong nationalistic policies towards TNCs, it is obvious that Singh's book of history did not contain these

records. To remind this august audience, the most notorious recent examples are Jacobo Arbenz Guzman in Guatemala, Sadeq Mossadeq in Iran and Salvador Allende in Chile.¹³

It is neither the occasion nor is it my intention to give a discourse on TNCs. But I would record very briefly the nationalist and patriotic third world perception on the impact of TNCs, based on a Latin American experience. There are three major assertions about the relations between TNCs and host countries in the third world.

The first proposition is:

The benefits of foreign investment are 'poorly' (or 'unfairly' or 'unequally') distributed between the multinational and the host or the country pays 'too high' a price for what it gets or the company siphons off an 'economic surplus' that could otherwise be used to finance internal development.

The second proposition is in four parts:

Multinational corporations create distortions within the local economy. There are innumerable allegations of distortions, but four appear to occupy positions of pre-eminence in the literature. First, TNCs 'pre-empt' the development of an indigenous economic base by squeezing out local entrepreneurs in the most dynamic sectors of the host country economy. Second, TNCs employ 'inappropriate' capital-intensive technologies adding to host country unemployment. Third, TNCs worsen the distribution of income in the host country or even produce an absolute loss for the lower 40 per cent. Fourth, TNCs alter consumer tastes and undermine the culture of the host country.

The third proposition:

Foreign investors prevent or subvert host country political processes (i) by co-opting the local elites; and/or (ii) by using their influence in their home countries to bring pressure to keep host governments 'in line', and/or (iii) by structuring the international system respond to their multinational needs to the detriment of host authorities.¹⁴

These assertions with local variations have universal application including our own country. All of them are contrary to the concept of 'good governance'.

With the enthronement of greed and avarice as the sole determinant of economic action, a thickening dark fog of pig-ethics is blanketing the conscience of men. It looks that the buccaneers and privateers are having a free run of the economy since the liberalisation. Otherwise how could one explain the continuous and rhythmic oscillation between scam and scandal from mid-1991 to now? From the securities scam of 1991-92 through the swindle of Rs 3,000 crore in the disinvestment of shares of PSUs as reported by the Comptroller and Auditor General of India, to the bitter-sweet sugar scandal, through the Indian vanishing trick of Rs 133 crore to the latest multi-thousand crore hi-tech telecom scam, the economy is having no respite from piracy and pillage.¹⁵

Just before his assassination, that great humanist Abraham Lincoln expressed his fear saying:

I see in the near future a crisis approaching that unnerves me and causes me to tremble for the safety of my country...Corporations have been enthroned, an era of corruption in high places will follow, and the money power of the country will endeavour to prolong its reign by working on the prejudices of the people until the wealth is aggravated in a few hands and the republic is destroyed.¹⁶

To sum up we have a fairly sound format of good governance in an active parliament and state legislatures, independent judiciary, free print media, constitutionally guaranteed system of decentralisation and devolution of power to the third tier of governance at the district level and below with direct democratic accountability through the gram sabha and a small but growing and vigilant civil society. But, on the other hand, the values which are at the foundation of our republic are under assault through the process of liberalisation. Unless we reorient our economic and social policies on the basis of the principles enshrined in the Constitution we may not have the substance of good governance. We may, in the process, destroy our republic.

Improving Fertiliser Use Efficiency

Vidya Sagar

Strategic Issues in Future Growth of Fertilisers in India edited by Gunvant M Desai and A Vaidyanathan; Macmillan India, 1995.

RAPID growth in fertiliser consumption has been the cornerstone of agricultural growth in India. Growth in fertiliser consumption is estimated to contribute over 60 per cent of the growth in foodgrain production, albeit through its dependence on irrigation and HYV seeds. Its continuous growth in future cannot be overemphasised. However, the spread and the growth of fertiliser consumption has not been uniform across various regions. While the role of irrigation and HYV technology in promoting fertiliser use is uniformly acknowledged, much less emphasis has been given to improving the efficiency of fertiliser use. It is this perspective that underlies the collection of well researched studies.

The book is set out in the backdrop of an excellent overview by Rao and Gulati of Indian agricultural development. A salient feature of the Indian foodgrain sector is the growing gap in the supply and demand mainly due to a deceleration in the domestic demand for foodgrains. This deceleration, despite rise in per capita income and decline in relative price of foodgrain, has resulted in a change in food balance and opened up prospects for export of foodgrains where India has a comparative advantage. This, in turn, provides a major opportunity for further improvement in resource use efficiency in Indian agriculture. Productivity of all inputs combined accounts for over 50 per cent of output growth in the post-green revolution period.

The Introduction (Chapter 1) by Vaidyanathan and Desai provides an overview of the issues. While summarising the findings of the six studies included in the book and their implications for policy reforms, the Introduction sets the perspective on future growth of fertiliser in India. The salient features of growth in fertiliser consumption in India include: high intensity of fertiliser use in areas of assured irrigation along with a slower but significant diffusion of fertiliser use on unirrigated lands; wide variation across states, districts and crops both in terms of spread and intensity of use; compared to price factors, the influence of non-price factor is stronger on diffusion and intensity of fertiliser use; and more importantly, the efficiency of fertiliser use has been lower than the level attainable with available technology. This might even have declined over time.

Bulk of the unexploited potential to raise crop yields through fertilisers is largely

concentrated in unirrigated areas. This requires far greater efforts and a more sophisticated approach than has been the case in the past. The key elements of the policy reforms, according to the authors, include (i) a vastly improved research and extension system to provide location specific recommendations on fertiliser practices in a highly diversified rainfed agriculture in order to improve its use efficiency through a more balanced nutrient use, (ii) timely and adequate supply of fertilisers to meet the requirements of such recommendations, and (iii) greater emphasis on moisture conservation and water management practices to improve efficiency.

The authors emphasise the need to reorient fertiliser price policies towards the promotion of balanced nutrient use. A review of the post reforms initiatives on fertiliser prices shows that prices of P and K were significantly increased to the detriment of nutrient balance. Production and distribution structure of fertilisers in India is characterised by a relatively stable supply (largely domestic) of N fertilisers in a controlled price regime. Supply of P and K, on the other hand, is subjected to wide international price variation. Such a heterogeneous structure of fertiliser supply requires greater initiatives for promoting nutrient balance.

I

The first three papers in this collection are set out in the framework of agro-climatic regions (ACRs) and discuss agricultural growth, fertiliser use and its efficiency in an all India perspective. The next three papers are regional studies on Gujarat and semi-arid tropics in India.

Through a cross-section analysis of the 14 agro-climatic regions, 43 agro-ecological zones and 275 districts, Desai and Rustagi, in their paper on 'Agricultural Growth in India: An Agro-climatic Environment Based Perspective' analyse the pattern, composition and determinants of agricultural growth across agro-climatic regions. The study observes a strong impact of agro-climatic factors on agricultural growth through their impact on yield increasing inputs in general and on fertiliser use in particular. Across climatic regions, faster growth of output is positively associated with a more efficient use of fertilisers. This should be an important reason for slower growth in fertiliser use in

the high rainfall (1400-1600 mm) regions where the productivity of yield increasing inputs is the lowest. Although the study does not attempt analysis of imbalances in fertiliser use across agro-climatic regions, the policy implications strongly suggest the need for a more balanced use of fertilisers. Pointing out imbalance in the fertiliser practices of farmers in as developed a region as Punjab, it is observed that as large as 57 per cent and 37 per cent cultivators in 1981 and 1987 were using nitrogen alone in paddy cultivation.

The paper, 'Fertiliser Response Function Environment and Future Growth of Fertiliser Use on Wheat and Rice in India' by Gandhi, Desai, Raheja and Prem Narain, is a rigorous analysis of over 12,000 field observations from ECF. The study analyses estimated fertiliser response functions with N alone, and N and P in fixed ratio of 2:1 and NPK in the ratio of 2:1:1, to bring out both the importance and limitations of balanced application (p 71). The analysis examines fertiliser use efficiency in 51 districts in six geographical regions over a four-year period. In over 12 per cent cases in wheat and 15 per cent cases in rice the responses are statistically non-significant, implying zero response or an absolutely unviable fertiliser application when only nitrogen is applied. The cases of questionable viability (fertiliser response below the critical viability limit of 5 in wheat and 3 in rice) with only nitrogen exceed 26 and 10 per cent, respectively. The number of unviable cases drops sharply as phosphatic and potassic fertilisers are used within nitrogen.

In wheat, the high incidence of below 5 initial response to N drops from 26 per cent district years to 6.4 per cent with NP and to 5.1 with NPK. Such balance, however, does not help in the western plateau, east-coast plateaus and hills and in Gujarat and Maharashtra. Similarly, balancing eliminates most of the non-viable initial response in rice. The marginal product at 100 kg of nutrients exceeds 10 in 15.4 per cent district years with N alone as against 27 per cent and 31 per cent with NP and NPK. However, at higher levels of application (200 kg) both in wheat and rice the marginal product with N alone turns out to be at least as high as with NP and NPK. In rice, for example, marginal product exceeds 6 in 23 per cent cases with N as against 17 per cent cases with NP and 16 per cent cases with NPK.

The study observes an unviable higher level of and nutrient imbalances in fertiliser use in the north (wheat) and in the south (rice). Simulating the effect of a change in the composition of nutrients from the present level to 2:1:1 along with a regional

reallocation of fertiliser consumption in favour of UP and central region would provide an additional 6 million tonnes of wheat. Similarly, reallocation away from the South along with balancing may increase rice production by 15.4 million tonnes from an additional fertiliser consumption of 2.9 million tonnes.

Based on a large sample survey the paper 'Fertiliser Use Pattern during the Mid-1980s: Micro-Level Evidence on Small and Marginal Farmers' by Kumar and Desai analyses diffusion and intensity of fertiliser use across farm size, crops and irrigation status. Although the study reports widespread use of fertiliser across farm size and irrigation status, positive association between the three components of fertiliser use, namely, number of adopters, area fertilised and intensity of application and farm size is evident. Four sets of factors have contributed to the widespread adoption of fertilisers in the past. These include (i) greater awareness on fertiliser use, through both the extension and demonstration effect, as a substitute for scarce organic manure to sustain high yield levels, (ii) increasingly easy access to fertilisers, and (iii) growth in irrigation and spread of HYV. Logit analysis carried out to identify factors influencing farmer's decision on fertiliser adoption confirm the importance of farm size, HYV and irrigation as well as of access to credit. Awareness and use of fertiliser is not as great a problem during the 1980s as its discontinuous use and deficiencies in fertiliser practices leading to a lower fertiliser use efficiency. The authors recommend enhanced location specific research on fertiliser practices to fill this gap.

Although the study is planned with respect to agro-climatic regions, no attempt is made to bring out region specific characteristics in affecting fertiliser use pattern. This micro-level study could have provided sharper insights if the analysis was attempted in terms of 14 agro-climatic regions and would have complemented the macro analysis in Chapter 2 to provide a holistic picture.

SUPPLY SIDE FACTORS IN PROMOTING FERTILISER USE

Two subsequent papers focus on the role of supply side factors in promoting fertiliser growth. The paper by Nampoothiri and Desai, 'Demand versus Supply Factors in Growth of Fertiliser Use: Gujarat's Experience', focuses on the deceleration in the growth in fertiliser consumption during the 1980s. The growth rate of fertiliser consumption declines from 27 per cent in the 1960s to 10 in the 1970s and 6 in the 1980s. The growth in fertiliser consumption during the 1960s and 1970s is attributed to the creation of potential for fertiliser use, (i) by irrigation and HYV, and (ii) conversion of this potential to effective demand largely through supply

side factors, viz, creating awareness and providing knowledge about and credit for fertiliser use, on the one hand, and providing a well organised supply and distribution system, on the other. In the 1980s such potential for the growth of fertiliser consumption was severely constrained. The momentum of growth, therefore, became critically dependent on tapping the unexploited potential mainly by increasing intensity of fertiliser use and promoting its diffusion in unirrigated and non-HYV areas. To be successful this required sharply focused and well co-ordinated efforts on extension, credit and fertiliser distribution system.

The strength of the fertiliser supply and distribution system that helped rapid diffusion during the 1960s and 1970s weakened during the 1980s due to a number of factors. This, according to the authors, was the main reason for the deceleration in fertiliser consumption and not an adverse price environment which was more conducive to fertiliser use during the 1980s than the earlier decades. Because of the virtual stagnation in potential creation through HYV-irrigation during the 1980s, a further growth in fertiliser use could be achieved by increasing intensity of fertiliser application which, in turn, critically depends on the improvement in fertiliser use efficiency. This comes out of their cross-section analysis at the district level. During the 1980s, the two supply side factors, viz, density of distribution network and availability of distribution credit to co-operatives have higher correlation coefficient with fertiliser consumption than the demand side factors, namely, irrigation and HYV. What does not come out of their analysis clearly is the weakening of supply side variables. The study rightly emphasises the need to increase fertiliser potential through location specific adaptive research and better agronomic practices to improve fertiliser use efficiency.

However, its conclusion (p 158, para 2) that 'a deceleration in yield rates despite a sizeable growth in fertiliser consumption...' is rather vague. Yield growth results from a set of factors of which fertilisers is only one. Same quantity of fertilisers on a wider HYV and irrigation base would result in large yield growth. Declining efficiency of fertiliser use is some time estimated under wrong assumption, e.g., $e_f = \Delta Y / \Delta F$ while it should in fact be $(\Delta Y - B_1 \Delta H - B_2 \Delta I) / (\Delta F)$ [see Sarma and Gandhi 1990]. In the past, the three inputs were growing simultaneously and the fertiliser responses did include the impact of a fast growth in area under HYV. The scope for rapid expansion of area under HYV during the 1980s was severely limited as has been argued by the authors also. Therefore, whatever is captured as fertiliser response during this period is different from

the fertiliser response of the earlier periods which includes in fact the HYV effect also. If contribution of HYV and irrigation is eliminated from the composite fertiliser responses, viz, $\Delta Y / \Delta F$, the fertiliser (only) responses during the 1980s compare well with the responses during the earlier periods [Vidya Sagar 1995:A-164]. Fertiliser productivity, which includes the yield response to irrigation and HYV may be lower during the 1980s but not necessarily the fertiliser use efficiency as argued by the authors.

Notwithstanding the thrust of his argument on deceleration in the growth of fertiliser potential on unexploited potential, I wish the authors were a little more circumspect in emphasising the deceleration in growth rate of fertiliser consumption. For one, a comparison of growth during the 1960s (with an extremely low base) may not be comparable with the 1980s (para 1, p 137). On the other hand, if one ignores the short-term setbacks, one each during the mid-1970s and the mid-1980s, even the trend rate of growth during the 1980s (1981-90) is as high as during the 1970s (1971-80). The point to point growth rate in per hectare fertiliser consumption is higher (7.2) in the 1980s than in 1970s (6.3). It is erroneously computed in Table 5.7 as 9.3 for the 1970s and 6.5 for the 1980s. What has significantly happened during the 1980s is the growing imbalance in the nutrient use. However, as the authors themselves point out this is more due to a shift in cropping pattern against the crops using P and K (cotton and groundnut).

The study by Sah and Shah, 'Farmers Fertiliser Practices and Soil Testing Service: Evidence from Gujarat' aims at the analytical understanding of fertiliser practices of farmers with little irrigation and very high irrigation. Sub-optimal fertiliser use with respect to both level and composition (P:N ratio) is practised by farmers in unirrigated conditions in the absence of transfer of knowledge on optimum allocation by the extension system and sub-optimal fertiliser practices are observed even by farmers who receive their own field specific recommendation. The net return from fertiliser use based on field specific soil test was generally higher than from those based on either blanket recommendations or farmer's own practices. Still, adoption of soil test based recommendations did not exceed 33 per cent in any of the crops. The study observes that the farmers with better farming practices also follow soil test based recommendations while others tend to substitute better practices with higher fertiliser doses. On the supply side numerous deficiencies in soil testing services make it difficult to accept such recommendations.

The last paper, 'Soil Fertility Management and Fertiliser Use' by Desai, Rustagi and

Singh draws on the panel data from six villages in semi-arid tropics of India during 1975-76 to 1983-84. The study observes a persistent incidence of non-use of any nutrient. Sixty to 70 per cent of the total cultivated area in a year did not receive any nutrients and one-fourth of the sample farms did not receive any nutrient for as many as 5 to 9 years. Scarcity of manures is observed as a primary reason for non-use of nutrients. A decline in the non-use of nutrients is observed with the increasing use of fertilisers. Fertiliser use was not confined to irrigated or high value crops alone. The findings are at variance with the commonly held view that the low nutrient need of crops in these regions are being met by manures and inter-cropping with legumes.

II

The large and growing gap between the potential and the actual impact of growth in fertiliser use on output (Introduction, p 4) needs to be analysed more systematically than has been done so far. Two factors may be relevant in this context – whether this divergence between the potential and the actual is due to (i) spread of fertiliser on inferior production environment with low (realised) responses even at lower application rates which should theoretically be high; and (ii) fertiliser use efficiency declines primarily due to a further increase in application rates (intensification) in regions of high application thereby moving towards the flatter part of the response surface. This is described in Chapter 4 as the major culprit for declining fertiliser use efficiency. Analysis of district level responses in Chapter 3 on the lines similar to those in Chapter 2 would have been more useful.

A major limitation of this otherwise excellent collection of insights into fertiliser use in Indian agriculture is the assumption that most of the ills afflicting fertiliser sector are apparently due to farmers' fertiliser practices. Perhaps a paper on farmers' perceptions on nutrient imbalance or excessive use would have significantly increased the value of this collection. For example, nutrient imbalance is seen as a major reason for the difference in potential created by irrigation – HYV – fertiliser combination and the realised benefits. While the importance of a more balanced nutrient use cannot be over-emphasised no attempt is made to analyse as to what causes such nutrient imbalance. Whether such imbalance is due to farmers' ignorance, wrong messages by an inept extension network or by the macro-production environment characterised by unfavourable price regime, inadequate, unstable and untimely supply of irrigation and power or the supply of fertiliser itself. It is logical to believe that the farmer is a better judge of his micro-production

environment and most of the initiatives have to be with respect to macro-production environment. The issue of unfavourable price regime towards the desirable nutrition balance is taken up in the Introduction (pp 17-20). However, the message on extension is far from clear. This point is brought into focus from my comments [Vidya Sagar 1992] on an earlier work by Sah et al (1992).

The authors criticise the observed practice of over use of fertilisers in spite of a widespread network of soil testing laboratories in Gujarat and complain that the farmers have not responded to soil testing services. A careful reading into their results, however, shows a number of cases where soil test based recommended use is actually over use, with smaller yield, while over use observed by the authors is less than proper use, with higher yields and a further scope to increase production profitably (high value to cost ratio (VCR)). If excess use leads to higher than proper use yield rates, with a vast scope for further improvement in production (e.g. VCR = 36), then there are reasons to doubt soil tests recommendations. If so, *this could be one of the reasons for not responding to soil test services about which the authors complain.* The other observation of the authors that a high extension index does not ensure better farm practices and fertiliser techniques on which the efficiency of fertiliser use lies, raises further questions about the extension services.

The overall thrust of such arguments on declining fertiliser use efficiency due to excessive and imbalanced fertiliser use apparently depends on the ignorance of farmers on balanced application or better management of inputs. This very presumption is reflected when authors in Chapter 2 (p 54) maintain '...There is growing evidence of various deficiencies in farmers' fertiliser practices'. Pointing out imbalance in fertiliser use they observe that '...as large as 57 per cent of the cultivators in 1981 and 37 per cent in 1987 were applying only nitrogen in paddy cultivation in Punjab'.

A more realistic conclusion may result if one looks into the seasonal application of N and P and the chemical properties of such nutrients. While N is highly volatile and a larger part of its application is lost due to leaching and nitrification, P is more stable. Looking at the seasonal pattern of fertiliser application, the P:N ratio during rabi is at least twice as large as during kharif. It must be the stronger residual fixation of P in the soils that allows farmers a lower ratio during the following kharif season. Similarly, the critical observation that '...even more importantly, 75 per cent of these plots had received more than 100 kg of N, which indicates the possibility of nitrates leaching into groundwater...', needs some sobering. The very nature of irrigation (flood) in paddy cultivation would ensure leaching even at

low Nitrogen levels. The high doses of N, perhaps, are needed to maintain higher uptake in view of high Nitrogen losses. Fertiliser use efficiency in 1987 was substantially higher than in 1981 is shown using these data on wheat [Vidya Sagar 1995: Figure 16, p A171].

Ignorance of the farmer, therefore, may not be the cause of most of the problems faced by the fertiliser sector. More so, in stable production environments where the farmers learned faster from their environment and respond quicker to changes in macro-production environment. If one goes by the HYV evaluation surveys, response to P and K is not attractive even at moderate doses. This coupled with the distorted price policies could be a more prominent villain than the farmer himself.

Also, there is no apparent reason for the excessive obsession with the NPK ratio (Chapter 3). One does not feel easy with the results of the exercise that North could produce substantially more than the present level of production if fertiliser balance is changed to 2:1 or 2:1:1 from the present level. To argue that a uniform nutrient ratio of 2:1:1 can provide optimum balance across different agro-climatic conditions may be too optimistic. More so, when the ratio of N to P uptake exceeds six in wheat and three in rice and the fact that N is more volatile. The fact that marginal product of N at 200 kg per hectare exceeds six in 23 per cent district year in paddy as against only 17 per cent for NP and 16 per cent for NPK raises doubts about the validity of this ratio at higher levels of applications, at least in more efficient production environments. A uniform dose of NPK in the ratio of 2:1:1 is an unsustainable proposition and farmers would do better to apply their own wisdom in the absence of an efficient and responsive extension system. This is what they are, in fact, doing.

It would have been possible to infer more if the analysis was attempted in terms of the difference in optimal levels across districts within an agro-climatic region or across ACRs. As argued in Chapter 2, since more efficient use is positively associated with higher growth in agriculture via higher application rates, the route to higher agricultural growth should lie via higher application rates. Higher efficiency promotes higher application. It could be for this reason that fertiliser responses in more stable production environments are higher even at higher level of application. It would have been worth exploring, for example, as to which of the districts have fertiliser responses exceeding 10 even at 200 kilogram per hectare and why? (Table 3.10 and 3.16). Similarly, most of the farmers in the North may not be exactly applying excessive or imbalanced doses as has been argued in

Chapter 3. North is not a uniform region. Within the North 80 per cent of the observation in western Himalayas show zero response as against none in the trans Gangetic plains (Table 3.1). The re-allocation away from the north has to be specific whether away from trans-Gangetic region where fertiliser intensity is very high or away from western Himalayas (region 1). It has been argued elsewhere [Vidya Sagar 1995] that responses in trans-Gangetic region are far above the corresponding responses in UP under field conditions. Similarly, in rice South is not a uniform zone. Areas of poor efficiency needs to be distinguished from the areas of high efficiency both in UP and in the South for a meaningful analysis.

The ECF responses do not strictly represent actual field situation inasmuch as the field under the ECF gets the benefit of some expert advice by the agronomist (p 60). This is conceded even by the authors when they lower such responses in central and eastern regions (pp 84, 93) Naraina and Parikh (1987), similarly, lower the all-India fertiliser responses estimated from the ECF data, for wheat and rice by multiplying these by 0.7 and 0.4, respectively, to make it representative for the actual field conditions. For a more lively debate see Vaidyanathan (1978) and Parikh (1979).

At the back of all these pessimistic observations of declining fertiliser

productivity lies the assumption that farmers, in the past, were always on the efficiency frontier and throughout moved along with frontier while increasing fertiliser application during last three decades. This is a rather unrealistic assumption. It ignores the fact that a production function is the highest efficiency surface and most of the farmers operate well below such efficiency frontier in general and during initial years in particular; and gradually move towards it even with constant input structure [Sagar 1991, 1993, 1995, Chapter 4]. For an excellent analysis of this issue and the related empirical evidence see Kalirajan and Shand (1994).

Notwithstanding the excellent quality of the work and the insights that are provided by the state studies, I cannot share some of the pessimistic conclusions about fertiliser use which are recurrent in a number of papers. Similarly, for reasons discussed above, I cannot also share the excessive emphasis on the suggested NPK ratios even though nutrient balance is a significant factor. The individual farmer, in my view, is an optimiser with respect to his micro-environment in the prevailing macro-production environment. He can certainly not be blamed for the wrong signals that are provided to him, particularly via fertiliser pricing policies.

There are a number of printing errors. On page 99, for example, the map does not delineate the regions and at the top right

of the map Himachal Pradesh is shown where Arunachal Pradesh should be. On page 38 the period 62-64 is printed as 62-6.4. On page 61 Table 3.1 (second column) $N_2P_2K_2$ is written instead of $N_1P_2K_2$. Average response ratio in Table 7.15 on page 205 is wrongly computed. Pages 204, 214 and 221 are left unprinted in the book.

REVIEW

Fall and Rise of Productivity in Indian Industry

Has Economic Liberalisation Had an Impact?

Sumit K Majumdar

In this study the author examines productivity trends in Indian industry for the period 1950-1951 to 1992-1993, and for the sub-periods: 1960-1961 to 1992-1993, 1970-1991 to 1992-1993 and 1980-1981 to 1992-1993, using the latest available Annual Survey of Industries (ASI) data that have been released by the Central Statistical Organisation. Productivity is measured using a linear-programming based technique called data envelopment analysis. The results show that in the decade of the 1950s, industrial efficiency was relatively high; however, in the 1960s and 1970s there was severe retrogression in efficiency patterns. These patterns began reversing themselves only in the 1980s; while efficiency in the 1980s was no better than it had been in the 1950s, data indicate that Indian industry has reached its highest efficiency potential throughout the 1990s thus providing some evidence that the reforms seem to be working.

I Introduction

ECONOMIC and industrial growth is the result of the interaction of two key factors: investment in capabilities, which is a function of savings, and the productivity with which these capabilities are utilised. In searching for explanations of India's hitherto lacklustre industrial growth, a low savings rate is not responsible, since that grew from 10 per cent to 25 per cent between 1950 and 1984. Therefore, one possible reason can be the productivity of the investments which were made. Inefficiency in resource usage and productivity is well-recognised as leading to substantial welfare losses [Harberger 1959], and for a state like India, with a multiplicity of socio-economic demands on its capital, how such limited resources are utilised assumes fundamental importance. While substantial investments can be a precondition for economic transformation, it is only the productivity of such investments which yields further re-investible resources. These generate surpluses, which then motivate entrepreneurs toward undertaking further industrial activity.

In a dynamic context, an approach where focus is on output growth rather than on the efficiency in generating such output ignores a basic concept: capital has an opportunity cost; if it does not yield a minimum return as a result of good utilisation, it is better used elsewhere. That efficiency in resource utilisation has to be given a center stage role in policy analysis cannot be denied, since dynamic efficiencies are critical in ensuring the industrial performance of a nation. In the Indian literature, there is now belated recognition that efficiency has a major role to play in ensuring industrial success. Nayyar (1994:3) writes that "Success at industrialisation is not only about resource allocation. It is as much, if not more, about resource utilisation and resource creation. The mode of utilisation of resources is a

critical determinant of economic efficiency. The process of creation of resources is a crucial determinant of economic growth."

Extending prior research [Majumdar 1996a] that has examined productivity growth in Indian industry between 1950-1951 and 1988-1989, this paper documents productivity trends between the period 1950-1951 and 1992-1993. Specifically, new data for the years 1989-1990, 1990-1991 and 1992-1993 are used for evaluating whether the "reforms by storm" [Bhagwati 1993] that commenced in mid-1991 has had a discernible impact on the productivity of Indian industry. If the fundamental change that took place in industrial policy in July 1991 is truly a "policy switch" [Flood 1992], it can destroy the path-dependencies and inertia engendered in Indian industrial behavior in the previous four decades. With recently made-available data introduced into empirical analysis, it is possible to generate some prima facie evidence as to whether the recent reforms are working and Indian industry is actually making progress. The paper unfolds as follows. The next section describes the empirical analysis. The results are discussed thereafter and finally the paper is summed up.

II Empirical Analysis

DATA DESCRIPTION

To calculate the relative inefficiencies in Indian industry for the period 1950-1951 to 1992-1993, data from 1959 onwards generated by the ASI and data prior to 1959 collated from the *Census of Manufacturing Industries (CMI)*, publicly available in data sets constructed by Chandhok (1990) plus supplemented by newer ASI reports, are used. The ASI summary results for the factory sector are used as the principal data source for the purposes of this study. From the data set available, labour and capital inputs as well as data on various output measures can be identified.

Disaggregation at the industry level is feasible only for the period 1979-1980 onwards, and a lengthy time-series of over 40 years can be prepared only using the summary results for the factory sector. The ASI and CMI data relate to the organised sector of manufacturing industry, and the ASI data have been used by Ahluwalia (1985) in studies of growth and productivity in the Indian manufacturing sector. However, while empirical studies using CMI data [Little, Mazumdar and Page 1987] do exist they are rare. There are some minor differences between CMI and ASI data. CMI data collection did not cover small scale plants, a lacuna rectified by the ASI. However, given that the thrust towards the small-scale sector commenced seriously only during the second plan years of 1956 to 1961, the CMI incorporated data on almost all the relevant units that comprised organised manufacturing industry in India.

Four inputs and one output are used. The inputs used are rupee values of fixed and working capital, actual number of workers and actual number of administrative and support staff employed. The output variable is: gross production, expressed in crores of rupees. Capital inputs, both physical and working capital, are also expressed in crores of rupees. Labour inputs are expressed in thousands of employees. To deflate variables expressed in rupees the wholesale price index is used; the capital inputs and the output values are then expressed in constant rupees, an approach consistent with much empirical literature.

Proper measurement of output and capital is important, and following Ahluwalia (1985) gross output value is used as the output variable. Capital inputs can be actual book-values of physical capital given in CMI and ASI data. In measuring capital input, the use of undeflated book-values amounts is inaccurate and the book value series is deflated by a price index. The weakness of using deflated data alone is that it does not

FIGURE 1: INDUSTRIAL EFFICIENCY - 1950 TO 1993

take into account assets of different vintages bought at different points of time. Therefore, following Goldsmith (1962) and Hulten (1990) the perpetual inventory method is used. That involves assuming for some base year an amount as beginning capital stock, and an annual rate of capital consumption. These assumptions, as to beginning capital stock and capital consumption are contingent on researchers' biases, and capital input valuations may vary between researchers. However, the perpetual inventory method is a preferred mode of measuring capital inputs.

The data on Indian industries include capital stock data at net book value and depreciation. Combining these yields the gross capital stock. A real capital stock series is constructed using a perpetual inventory capital adjustment method, given by the equation: $K_t = (1 - D)K_{t-1} + \text{deflated gross investment}$, where K_t is the capital stock to be used for each year, gross investment is the change in the firms' undepreciated capital stock since the preceding year, and D is the rate of depreciation taken at 10 per cent, which is suggested by Hulten and Wyckoff (1981) as a consistent representation of the weighted average rate, over asset categories, of the economic depreciation. The initial capital stock, K_0 , equals the net book value of the capital stock for 1950. The approach is similar to the empirical approach adopted by Lieberman, Lau and Williams (1990).

Data for each year, other than for 1972-1973 are used. There are 42 observations covering the period 1950-1951 to 1992-1993. The *ASI* was not carried out for 1972-1973. Hence, there is a gap in the time-series of one year. The *Annual Survey of Industries* has been carried out since 1959 under the Collection of Statistics Act of 1953. It is the principal source of industrial statistics in India. Prior to 1959, a Census of Manufacturing Industries was carried out under the Industrial Statistics Act of 1942. The *ASI* extends to every part of the country, except some industrially-marginal states, and covers all factories registered under the Indian Factories Act of 1948. Essentially, all factories employing more than 10 workers and using power, or more than 20 workers and not using power have to report data. The

coverage of the entire industrial sector by the *ASI* and *CMI* data, coupled with over four decades of time-series coverage, yields a data set which can be used for assessment of the impact of economic policies on industrial performance, though availability of more recent data would have been preferred.

EFFICIENCY ESTIMATION PROCEDURES

Data envelopment analysis (DEA) is used to measure the relative efficiency of the Indian industrial sector using annual observations for the years 1950-1951 to 1992-1993, a procedure used in earlier research [Majumdar 1995a]. DEA is a performance assessment tool useful for uncovering patterns of dynamic efficiencies. Using only observed output and input data for observations, the DEA algorithm calculates an *ex post* measure of how efficient each observation was in converting inputs to outputs, accomplished by the construction of an empirically-based production frontier, and by evaluating each observation against all the others which are included in the data set.

Following Farrell (1957), two main paradigms have evolved in the construction of frontier production functions. There is the parametric approach, based on estimating regression-based production functions, and the non-parametric approach, based on estimating linear programming models of relative efficiency. The advantage of the non-parametric approach is that no explicit functional form, or assumptions relating to technology need to be incorporated, and it can handle multiple outputs and multiple inputs which no parametric technique can handle. The data need not all be quantitative,

and qualitative measures can be used as outputs or inputs. Concomitantly, both nominal and physical values can be simultaneously used as outputs or inputs, because the aim is not to estimate functional parameters, *per se*, but relative measures of efficiency among observations. DEA is similar to other newly-developed techniques for performance assessment, one of which is demonstrated in Banker, Chang and Majumdar (1993).

DEA has two properties which are relevant for the present study. First, it is a technique for comparative efficiency measurement. Each observation is evaluated against itself and all other observations. Thus, the efficiency of each observation, relative to all others in the data set, can be estimated. Therefore, the results that are arrived at relate explicitly to the observations in the data set. In the present case, efficiency is evaluated only with respect to observations for Indian industry over time. No conclusions can be drawn about whether Indian industry is equally efficient, or inefficient, compared to the industrial sector of some other country. Comparative analysis, using data for India in conjunction with data for other countries, can help evaluate how inefficient India is compared to other countries and remains an agenda item to be covered in future empirical research. Second, for each observation, a single efficiency statistic is calculated. This is a ratio measure of performance as to how efficient each observation was with regard to converting a set of inputs jointly and simultaneously into a set of outputs.

As developed by Charnes, Cooper and Rhodes (1978) [CCR] and extended by Banker, Charnes and Cooper (1984) [BCC], the Farrell output-input measure is generalised to a multiple output-input case using a fractional mathematical programme developed by Charnes and Cooper (1962), where the ratio of the weighted outputs to weighted inputs of each observation is maximised. Unlike in the regression-based parametric approach, where an explicit functional form for the production relationship is assumed, and a measure of technology can be incorporated as a variable in the overall regression, no assumptions about the underlying functional form or

TABLE . EFFICIENCY SCORES FOR INDIAN INDUSTRY

1950s	1960s	1970s	1980s	1990s
1950-51 1.000	1960-61 0.960	1970-71 0.753	1980-81 0.817	1990-91 1.000
1951-52 1.000	1961-62 0.951	1971-72 0.714	1981-82 0.865	1991-92 1.000
1952-53 1.000	1962-63 0.820	1973-74 0.690	1982-83 0.858	1992-93 1.000
1953-54 1.000	1963-64 0.791	1974-75 0.846	1983-84 0.883	
1954-55 0.988	1964-65 0.729	1975-76 0.766	1984-85 0.889	
1955-56 0.983	1965-66 0.682	1976-77 0.775	1985-86 0.925	
1956-57 0.976	1966-67 0.667	1977-78 0.782	1986-87 0.924	
1957-58 0.939	1967-68 0.695	1978-79 0.779	1987-88 0.906	
1958-59 0.974	1968-69 0.804	1979-80 0.768	1988-89 1.000	
1959-60 1.000	1969-70 0.776		1989-90 1.000	

technology are made in DEA, since the objective of estimation is to measure the relative ability of each observation to convert a multiple set of inputs into a multiple set of outputs.

If some observations are indeed efficient because of superior technology employed then an explicit measure of technology quality has to be introduced in subsequent regression models where the dependent variable is the efficiency measure generated by a DEA model. This approach has been used in other research work [Majumdar 1995b] to explain how the adoption of new technology, superior to the installed-base of the existing older technology, has positively impacted on the performance of firms in the US telecommunications industry. A measure of technology quality, the proportion of electronic switches to total switches, was used as one of the regressors in a model explaining inter-firm variations in technical efficiency, which was calculated using DEA. In the case where aggregate data are used, as in the present study, time can be treated as a disembodied measure of technical change, as is often done in studies of aggregate productivity, but deriving an explicit measure of technical change, which is intuitively acceptable and appealing, for the economy as a whole is very difficult if not impossible.

In the CCR model, constant returns to scale are assumed and the CCR efficiency score is a total efficiency score for each observation. BCC (1984) show that the CCR score confounds the effects of technical and scale efficiency, and can be decomposed into a pure technical efficiency component and a scale efficiency component, with the BCC model score capturing the resource-conversion efficiencies feasible by observations irrespective of returns to scale considerations. Dividing the efficiency score resulting from the CCR model by the efficiency score resulting from the use of the BCC model yields a measure of scale efficiency, which is the ability of each observation to operate as close as possible to its most productive scale size [BCC 1984; Majumdar and Chang 1996]. Since there is much writing on the technique, analytical details with respect to DEA are not gone into in this paper. Readers wishing to learn more should read Bauer (1990), Banker (1993), Charnes, Cooper, Lewin and Seiford (1993), Majumdar (1995c), or Seiford and Thrall (1990).

DEA is useful in estimating x-inefficiencies. Since x-inefficiency is the manifestation of inability to extract maximal output from the given inputs, in a DEA sense those observations which define the frontier, attaining a score of 1 on a scale of 0 to 1, are x-efficient. These are the observations which have utilised their full potential. Therefore, observations which score less than 1 are

x-inefficient, and the efficiency rating for each observation denotes a precise estimate of the empirically-assessed x-inefficiency that may be present [Leibenstein and Maital 1992; Majumdar 1995c].

The advantage of DEA lies in its approach. DEA optimises for each individual observation, in place of the overall aggregation, and single optimisation thereafter, performed in statistical regressions. Instead of trying to fit a regression plane through the centre of the data, DEA floats a piecewise linear surface to rest on top of observations. This is empirically-driven by the data, rather than by assumptions as to functional forms. The only assumption made is that the piecewise linear envelopment surface is convex. Next, the efficiency score is a bounded efficiency measure in that a score of 1.000 represents optimal attainment. Hence, any observation with a score of less than 1.000 has measurable potential for improvement. Also, traditionally certain assumptions underlie statistically-driven regressions, and in parametric production frontier analysis. Banker and Maindiratta (1988) show that behavioural assumptions can be incorporated within DEA models, and that also the analytical properties of DEA and non-parametric production frontier analysis in econometrics are equivalent.

DEA procedures are used to generate BCC efficiency scores using Indian industrial data for the period 1950-1951 to 1992-1993. An efficiency score for each observation is computed relative to the efficiency of all other observations and itself. In other words, the efficiency of industry in 1950-1951 is computed relative to the efficiency characteristics for all the other 41 observations up to 1992-1993, and so on. A set of relative efficiency scores for almost all of Indian industry is available for the entire period: 1950-1951 to 1992-1993.

III Discussion of Results

The BCC efficiency scores are listed in Table 1 and the overall efficiency trends are displayed in Figure 1. From Figure 1 it is

FIGURE 2: INDUSTRIAL EFFICIENCY - 1950 TO 1979

noted that Indian industry has not progressed in becoming continuously efficient overtime, if a monotonically-increasing time trend is taken to indicate progress. While Figure 1 and Table indicate that the overall trend in efficiency is one of decline and rise, there is significant heterogeneity visible in the efficiency patterns within each of the four decades studied. Therefore, the overall fall and rise can be disaggregated into periods of no decline, sharp declines, recovery and progress. These trends are visible from Figure 1.

EFFICIENCY PATTERNS IN 1950s

A decade-specific analysis shows that through the 1950s Indian industrial efficiency was high compared to its performance in the 1960s, 1970s and most of the 1980s. Efficiency patterns only showed a resurgence in the late-1980s. Fortunately, this resurgence has continued into the 1990s so far. Recollect that the 42 observations are being compared to each other. The observations which are frontier definers or the most efficient years are: 1950-51, 1951-52, 1952-53, 1953-54, 1959-60, 1988-89, 1989-90, 1990-91, 1991-92 and 1992-93 when efficiency in output generation is assessed. However, for over a quarter of a century, between 1961-1962 and 1987-1988, efficiency was grossly low compared to what Indian industry had been capable of attaining in the 1950s, as shown by the data, or it is capable of attaining as is shown by data for the 1990s. Between 1954-1955 and 1959-1960 there were small dips in efficiency, but the efficiency scores for these years were always over well over 0.90.

EFFICIENCY PATTERNS IN 1960s AND 1970s

The table shows that the largest drop in efficiency took place in the 1960s and the early 1970s. Efficiency declined dramatically between 1960-1961 and 1973-1974. The 1960s are years when macro-economic factors were unfavorable to India [Joishi and

Little 1993]. Foreign exchange crunches worsened, with an import-substituting autarkic regime going into place. During the 1960s there were shortfalls in agricultural production, leading to demand-side imbalances for the industrial sector. There was a severe drought in 1964, with spillover effects of its impact into the years 1965, 1966 and 1967, as a result of which demand shortfalls were likely to constrain industrial growth and productivity. Arguments have been advanced that it does not serve much purpose to consider high inefficiency as a performance criteria if capacities are underutilised, since unfavourable efficiency scores will follow as a statistical result [Nayyar 1994]. Capacity utilisation is likely to be low when there is a demand shortfall, but that assumes demand shortfalls in both domestic and export markets. If only the domestic market is targeted, then it is possible that demand shortages will exacerbate inefficiencies. But the non-targeting of external markets as a consequence of which high production volumes, which lead to learning economies and associated economies of scale, which are the hallmarks of South Korean, Taiwanese and modern Chinese industrial growth, are not gained is a policy failure which has arisen because of the export pessimism in India.

Coupled with purely looking at the internal market as the driver of volume, and then limiting participation in this market to incumbents, who, thereafter, face no entry threats, reduces incentives to be efficient. It is well known that the policy regimes in place in the 1960s is characterised by the perfecting of the 'licence raj' [Ahluwalia 1985; Bardhan 1984; Bhagwati and Desai 1970; Bhagwati and Srinivasan 1975; Marathe 1989; Rudolph and Rudolph 1987] which allowed incumbent industrialists to make hay even in a cloudy environment. As the administration of the controls-based 'licence raj' was being perfected in the 1960s, there was a major drop in efficiency from 1961-1962 to 1966-1967. The drop is extremely significant. From a reasonable position, with a score of 0.960 in 1960-1961, industrial efficiency dropped dramatically to a score of 0.667. This is the lowest noted efficiency score in the entire study. There were marginal improvements up to 1968-1969, but significant drops thereafter. The evidence points not only to a major regression away from the scores that were achieved in the 1950s, but an inability to catch up.

Mohan and Aggarwal (1990) list how, in the decades of the 1960s and 1970s, control over resources got operationalised into a number of steps that had to be gone through by an entrepreneur before production could commence. There were many major and comprehensive controls which had been negotiated by any industrial unit. These

included, *inter alia*, procedures relating to acquiring a letter of intent to start an industrial firm, capital goods imports clearances, foreign-technology collaboration clearances, capital issue clearances, raw materials import clearances, essentiality clearances, indigenous non-availability of equipment and material clearances, monopolies clearances, small-scale sector clearances and clearances for locating in non-municipal areas. The multiplicity of administrative hurdles not only reduced flexibility in launching projects, but inevitably tended to increase project and production costs.

That the industrial policy system permitted administrative excesses to take place, which in turn fostered patronage and rent-seeking, has been earlier commented on, *inter alia*, by Bardhan (1984), Bhagwati and Desai (1970) and Bhagwati and Srinivasan (1975). Bhagwati (1993:49) has written "Few outside India can appreciate in full measure the extent and nature of India's controls until recently. The Indian planners and bureaucrats sought to regulate both domestic entry and export competition, to eliminate product diversification beyond what was licensed, to penalise unauthorised expansion of capacity, to allocate and prevent the reallocation of imported inputs, and indeed define and eliminate virtually all aspects of investment and production through a maze of kafkaesque controls. This all-encompassing bureaucratic intrusiveness and omnipotence has no rationale in economic or social logic; it is therefore hard for anyone who is not a victim of it even to begin to understand what it means."

Similarly, during the rest of the 1970s efficiency continued declining, albeit at a lower rate. Negative macro-economic forces notwithstanding, the policy regimes in place in the 1960s and 1970s must account for a large share of the inefficiencies noted. Because every major strategic and operational decision was relegated to the bureaucracy in New Delhi, even if a licence had been obtained, there were no factors over which entrepreneurs had control. Licensing allowed a finite market size to be made available to each entrepreneur who succeeded in acquiring a licence. Hence,

there were no incentives for survival in a competitive battle-ground. How the officially-sanctioned market was to be served was also dictated to by the authorities. Thus, there were no avenues left for industrialists to display any creative or craftsmanship skills, for example in product differentiation. Since the government dictated all strategic and operational decisions, firms merely had to go through the motions of undertaking industrial activity, as recounted by Bhoothalingam (1993), a former very senior civil servant.

That Indian industry got away with exerting minimal effort seems evident, living the "quiet life" [Hicks 1935], because there were no reasons to minimise costs or strive for superior performance. The impact of legitimised market pre-emption and day-to-day interference by government, on the other, are reflected in the patterns of extremely low efficiency. Bhagwati (1993:54) has noted the following, in his evaluation of the outcomes from industrial policy: "The Indian embrace of bureaucratic controls was also encouraged by additional objectives, none of them served well by the control system in practice. One was the prevention of the concentration of economic power, by licensing the creation and expansion of capacity. But, if monopoly power was to be reduced, the virtual elimination of domestic and foreign competition (i.e., the elimination of the 'contestability' of the market) was hardly the way to do it."

The policies of the 1960s continued well into the 1970s. A more detailed blow-up of part of Figure 1 is shown in Figure 2. Figure 2 shows the productivity trends between 1950-1951 and 1979-1980. The steep fall in productive efficiency in the three decades is sharply brought out by Figure 2. The years between 1960-1961 and 1979-1980 display policy continuity, though the political scenarios were different, and in the mid-to-late 1970s there was an exacerbation of the role of government as an influencer of micro-level decisions. Between 1965-1966 and 1980-1981, when a structural upswing in efficiency began, patterns of efficiency moved up and down. Two rising peaks of rising efficiency are, however, noted in 1968-

FIGURE 3: INDUSTRIAL EFFICIENCY - 1980 TO 1993

1969 and for the period 1974-1975 to 1976-1977. It is interesting to speculate on the potential causes.

During the late 1960s there was a threat to industry of possible stringent monitoring, following the recommendations of the Industrial Licensing Policy Inquiry Committee. In early 1969 Indira Gandhi nationalised a significant portion of the banking industry. There was a clear threat that other industries or sectors of the economy could follow suit. The administration could turn authoritarian. The years 1975-1977 saw the presence of an 'emergency' situation which did provide micro-level incentives, certainly fear, to industry to become more efficient. Following major political unrest, which was put down firmly by the government, the administrative regime did turn authoritarian. During these time-periods policy pressures seemed to be devolving on industry to behave less profligately, with concomitant internal pressures engendering efficiencies. Nevertheless, in spite of such 'positive' blips, Indian industry has gone through two decades of retrogression in capabilities in the period 1960-1961 to 1979-1980.

EFFICIENCY PATTERNS IN 1980s

The 1980s have been referred to as the years in which micro-level forces were recognised as being important to industrial and economic progress [Marathe 1989]. After falling between 1976-1977 and 1979-1980, from 1980 onwards efficiency patterns begin to show an upward-rising trend, culminating only in 1988-1989 being a frontier-defining or an efficient year. During the 1980s efficiency increases have been significant, as the table shows. Figure 1 reveals almost a monotonic increase in the technical efficiency scores. Figure 3 is a blow-up of a part of Figure 1 for the period 1980-1981 to 1992-1993. The steep increase in productive efficiency is evident from Figure 3. Between 1980-1981 and 1988-1989, the annual productive efficiency scores rise from 0.817 to 1.000. Such a rise is steady, and there are no major dips in the score between any pairs of years.

Opening up of the market to foreign technology purchases, allowing plants with sufficient economic scale to be established, and encouraging the establishment of 'sunrise' industries are characteristics of the policy environment from the early 1980s [Marathe 1989]. In import licensing, particularly with respect to capital goods, the realisation that India had to learn skills and adapt new technology from abroad led to significant lessening of import restrictions. This occurred from the early 1980s, after a Committee on Imports-Exports Policies and Procedures had reported. The realisation that

industry faced was: business practices as usual in managing the labyrinthines of bureaucracy were somewhat less critical than organisational prowess needed in managing operations, production processes, marketing strategies, and the onslaught of potential competition. Potential changes in incentive structures and in the factors which guaranteed industrial survival meant that an efficiency orientation might begin to carry a premium.

At a micro level, there were many firms which had pre-empted capacity in the 1970s. This meant that large quantities of capacity were installed, both legally and in contravention of licence provisions in the 1960s and 1970s. Hence, surplus capacity abounded. In the early 1980s, the existence of surplus capacity was ratified. The existence of such surplus capacity may have had some impact on the drop in efficiency in the 1960s, and particularly the 1970s, since capacity in place was not utilised to generate output as there were penalties for doing so. Thus, another reason for the efficiency catch-up in the early 1980s, along with the changed policy scenario, is the utilisation of existing capacity already in place for actual production purposes.

While the efficiency growth of the 1980s looks relatively high, the 1980s are being compared to the three prior decades: 1950s, 1960s, and 1970s. Relative to the performance achieved in the 1950s, performance for the 1980s is lacklustre. For instance, the average efficiency score in the period 1950-1951 to 1959-1960 was 0.986, while in the period 1980-1981 to 1989-1990 it was 0.907. Hence, though there has been an efficiency spurt in the 1980s, it has only been to catch up with what was once attained in the 1950s. Indian industry has shown a decade of relative progress in the 1950s, two decades of severe structural retrogression, in the 1960s and the 1970s, and a decade of catch-up in the 1980s.

EFFICIENCY PATTERNS IN 1990s

For the observations belonging to the 1990s: 1990-1991, 1991-1992 and 1992-1993, efficiency scores of 1.000 are noted. This implies that each observation is a

frontier-defining observation which is maximally efficient*relative to other observations in the data set. In other words, Indian industry has attained an optimal efficiency level in the 1990s relative to its performance in the 1960s, 1970s and most of the 1980s. While ASI data for subsequent years (1993-1994; 1994-1995; and 1995-1996) have not yet been released, the preliminary conclusion is that the 1991 reforms have had an efficiency impact. Much has written about the nature as well as the various specific aspects of the reforms; therefore, further details are not recounted in this paper. What is particularly revealing from the data analysis is that the rise in the productive efficiency scores that took place in Indian industry since the 1980s has been not only sustained in the 1990s, but Indian industry has reached relative optimality in its performance over time in the 1990s. The average score in the 1990s is 1.000.

Output growth is one dimension of industrial performance, and industrial output has grown rapidly in the 1990s. This empirical phenomenon has also been the subject of much writing in the popular press. If, however, consumption of inputs rises at a faster rate than the rate at which output rises then such a trend is a sure prescription for industrial bankruptcy in the not-too-distant future. Therefore, efficiency and productivity growth is a qualitatively much more critical and important variable that captures the innate capabilities and dynamism of a country's industrial sector. Output growth may take place because the size of the overall market is expanding. But efficiency growth occurs because industrial capabilities are being continuously enhanced. At a micro-economic level, such efficiency growth is critical if industrial expansion is to take place. Without efficiency growth, countries tend to lag behind in the global national income stakes. Countries in which there is high industrial efficiency growth tend to forge ahead in generating larger amounts of national income which support superior standards of living.

With respect to late-19th century industrial growth in the US, Chandler (1990) shows how important the attainments of functional

efficiencies were behind the growth of industrial enterprises which catapulted the US into being the major industrial power in the world. No doubt, the US market was large and this permitted scale economies to be attained. Nevertheless, strategies to enhance functional and technical efficiencies were simultaneously implemented, leading to major overall productivity gains. Amsden (1989) recounts a similar story in respect of the South Korean experience in the 20th century. For South Korean firms, continuous functional efficiency-attainment has been the principal driver in enabling them to acquire competitive advantages which have been translated into global market share.

The results presented in this paper, which addresses an important issue with respect to Indian industrial performance, therefore, suggest that Indian industry might have the ability to display sustained efficiency growth necessary for furthering local industrial progress. But whether Indian firms will ever be as competitive as firms in OECD countries or South Korean and Taiwanese firms is open to question. Preliminary results of a comparative study (not presented in this paper), involving analysis of industrial productivity between India and seven other OECD countries for the decade of the 1980s, indicate that Indian industrial productivity is less than 15 per cent of the OECD average. Thus, Indian industry still has an enormous amount of global catching-up to do. Even doubling of productivity will not make Indian industry half as productive, or, therefore, as competitive, as the industrial sector of OECD countries.

SOME ADDITIONAL EFFICIENCY RESULTS

The results obtained from a DEA model is sensitive to perturbation of the data. Inclusion of additional observations or removal of some observations may alter the results. Therefore, to test whether the results obtained for the years 1990-1991, 1991-1992 and 1992-1993 are stable with respect to the inclusion or omission of different years' observations, a series of additional efficiency models are estimated. Specifically, three additional models are estimated: (1) an efficiency model using data only for the years 1960-1961 to 1992-1993; (2) an efficiency model which uses data only for the years 1970-1971 to 1992-1993; and (3) an efficiency model which uses data only for the years 1980-1981 to 1992-1993. The results of such subsidiary data analysis are also displayed graphically, in Figures 4 to 6. As these figures show, the efficiency scores for the years 1990-1991, 1991-1992 and 1992-1993 are still 1.000 in each of these three additional models. Therefore, the results obtained for the 1990s are robust to variations in the structure of the data.

FIGURE 6: INDUSTRIAL EFFICIENCY - DATA FOR 1980 TO 1993

IV Some Concluding Remarks

Guha (1990) notes that the balance of opinion on the relative success of market mechanisms versus control over economic activities rests on the ability of one system to mobilise incentives versus another. The issue of whether free-market competitive forces or command and control regimes generate the right incentives so as to reduce inefficiencies depends on the nature of policies and the way they are implemented. Whether Indian policy regimes have marshalled the right sorts of incentives which influence economic agents to maximise efficiencies is an empirical issue. In this paper patterns in the efficiency existing in Indian industry was analysed for the period 1950-1951 to 1992-1993. Till mid-1991, though various reforms had been tried out since the 1980s, there was broadly a command-and-control industry policy regime in existence. The availability of data for the years 1991, 1992 and 1993 has enabled an assessment of whether the reforms, which involved a shift to open-market mechanisms for regulating economic activity, have had an efficiency pay-off in comparison with past years' efficiency patterns.

The analysis of efficiency sheds light on whether economic progress is taking place, since efficiency patterns reflect the micro-capabilities of the industrial sector of a nation. In countries where government policies have a strong impact on industrial behaviour, the impact that policies have on observed efficiency patterns yields major insights into

the success of these policies. The way policies are administered can also lead to inefficiencies. Even when there is significant government control over industrial progress inefficiencies may not result, as South Korean productivity growth shows. Provided entrepreneurs are given targets, reasonable time to meet them in and then they are monitored, they can decide what their operational objectives ought to be and utilise their organisational capabilities in meeting targets [Amsden 1989].

On the other hand, policy administration can be ad hoc and dilatory. Lack of monitoring and follow-through, or political factors, can be mediating influences in how policy is actually administered. At the level of the firm, long-range views of strategic decisions disappear; furthermore, motivation to be innovative is also absent because of uncertainties that policy regimes may foster [Leibenstein 1969], and is replaced by rent-seeking behavior [Krueger 1974]. With regard to the Indian experience, Bhagwati (1993:60) writes, "I should also add that the deadly combination of industrial licensing and controls at home with import and exchange controls externally, effectively cut off the rigours of competition and made the creation of a rentier, as against an entrepreneurial, economy more likely. X-inefficiency was certainly to follow, with only the exceptional escaping from the wrong set of incentives."

The efficiency results show that as industrial policy became regulation-oriented in the 1960s efficiency dropped steeply. As the regulation and control regimes turned

authoritarian in the late part of the 1960s and mid-1970s, there were occasional spurts in the efficiency scores. These were notable when threats of stringent monitoring were felt in the industrial sector, notably in the periods 1968 to 1970 and 1974 to 1977. Efficiency scores started rising only in the 1980s when tinkering with the reforms process started. But the increase in efficiency that has taken place in the 1980s is merely a catch-up with the efficiency levels that were attained in the 1950s.

Aims of the 1991 industrial policy reform include the enhancement of market contestability, a factor which significantly improves x-efficiency [Leibenstein 1976], and a reduction in the role of the state as a micro-manager of industrial progress. The post-1991 relaxation of rigorous controls both on the production capacities that firms can put into service specific market segments, and on market entry by new domestic and foreign competitors have served to increase market contestability in India. Even if actual market entry might not occur for some time, the threat of potential competition is often enough to induce efficiencies. Indeed, Schumpeter (1975:85) had said that "It is hardly necessary to point out that competition of the kind we now have in mind acts not only when in being but also when it is merely an ever present threat. It disciplines before it attacks. The businessman feels himself to be in a competitive situation even if he is above in his field, or if, though not alone, he holds a position such that investigating government experts fail to see any effective competition between him and any other firms in the same or a neighbouring field." Hence, even monopolists feel entry threats and exacerbation of such entry threats over time can induce efficiencies in industry.

The reforms process has not only exacerbated entry threats for the sitting incumbents in Indian industry, but the environment is equally competitive for new entrants. Attainment of efficiency is a key survival criterion in such situations, and the Indian reforms have so far yielded positive efficiency outcomes. These positive outcomes are noted for the 1990s, relative to the low efficiency levels that were observed for the 1960s, the 1970s and the early and mid-1980s. These were the periods when Indian industry was reeling from the effects of the command-and-control based industrial policy regime. Thus, relative to past industrial performance, the liberalisation process seems to have had a positive impact on current Indian industrial performance.

A number of future research programmes on Indian firms' behaviour and performance can be undertaken; however, a specific aspect of firm-level behaviour that ought to be researched with Indian data, and on which there is no evidence, is suggested. A major

theoretical implication of the environmental change that occurs with economic liberalisation is that the gradual opening up of markets induces firms to improve resource utilisation because the onset of competitive forces destroys monopoly rents and replaces these with efficiency rents. In an evolving competitive environment a greater volume of information emerges [Hayek 1945]. Such factors alter resource accumulation strategies within firms and changes take place in firms' entrepreneurial capabilities [Kirzner 1973], leading to adoption of new technologies and work practices. The adoption of technological and organisational innovations have a very large impact on productivity at the level of the firms. In the literature, a bandwagon or imitative process at work among firms is associated with entrepreneurially-oriented behaviour [Leibenstein 1950], and a number of contemporary empirical studies [Ghoshal 1988; Mahajan Bettis and Sharma 1988; Majumdar 1996b; Orru, Biggart and Hamilton 1991] have found firm-level behaviour to be consistent with the bandwagon-jumping hypothesis. Such a process leads to the enhancing of firm-level capabilities, which subsequently impacts on how resources are utilised within firms, leading to superior performance of industry as a whole.

Firms are not necessarily rational and calculating in their decision-making, but rely on heuristics [Nelson and Winter 1982]. One heuristic can be to do what other firms do, and there are several reasons why bandwagon influences arise. The first relates to reducing potential uncertainties which arise because the environment is fluid and changing. There is the need for ambiguity reduction. Ambiguity can arise because of a lack of clarity regarding an assessment of the risks and costs, versus the benefits, of adopting a course of action [March and Olsen 1976]. If such ambiguity levels are high, firms have a lower threshold of taking adoption decisions based on their own analysis. Such decisions are more likely to be influenced by whether or not compatriot firms are adopting an idea, since if they are doing so some of the uncertainty for the converting firm is reduced.

Similarity in managerial outlook leads to the emergence of bandwagon influences [DiMaggio and Powell 1991]. Within a homogeneous industry context there is likely to be similarity of outlook among members of management teams within firms. Another reason is that managers are risk-averse and try to avoid the worst-case scenario even if the best-case scenario is sacrificed in the process [Kahneman and Tversky 1979]. Bandwagon influences occur because of a perceived threat of a loss of advantage. If a new idea is not adopted and is successful, there is the possibility for a non-adopter's

performance to fall below average. Given such a situation, bandwagon influences are felt to keep up with expected average performance levels, otherwise progressive conversion by compatriot firms increases the risk for a non-adopter's performance to fall below average. In these circumstances, conversion pressures are strong since an adopter's performance will approach the average whether the idea in question fails or succeeds.

The economic liberalisation that has taken place represents, for India, a radical natural experiment which has significant ramifications in changing firms' behaviours and the strategies that firms adopt. These behavioural changes have significant productivity connotations. Micro-econometric studies of firms' behaviour, given a changing economic environment, are necessary so as to assess whether the behavioural assumptions that ought to implicitly underlie the policy changes that have taken place are validated by the actual outcomes. The policy change that has taken place in India in the 1990s does significantly alter the environment for firms, enhancing potential munificence and opportunities on one hand, but also enhancing uncertainty and ambiguity levels much more, on the other. In this changing context, assessing whether firms' behaviours are indeed consistent with the bandwagon-jumping postulates, then, becomes one research topic that can well be researched with the available data on Indian firms.

Industrial Pricing and Growth Fluctuations

Some Tests

Ashima Goyal

This paper examines the relationship between the mark-up and activity, for disaggregated industrial sectors in India. Mark-up pricing is shown to be consistent with profit maximisation, and the theoretical hypothesis about pricing behaviour is tested empirically.

The issues addressed are important because the mark-up is a major component of the inflationary process. Understanding variations in it will help to understand inflation. Secondly, the mark-up is also the profit share, and as such affects both the savings and investment decisions, and influences medium-run growth or macro-economic activity. An implication for policy, is the possible stagflationary consequences of a demand squeeze, especially a cut in investment. In the absence of a supply shock, inflation is likely to be lower and growth higher when demand for industrial goods is high.

I Introduction

THE paper examines the relationship between the mark-up and activity, for disaggregated industrial sectors in India. It also tests a theoretical hypothesis about the nature of this relationship. It is shown that under certain conditions mark-up pricing is equivalent to neo-classical optimal pricing. The mark-up is not ad hoc.

Earlier writings in this area have followed the traditional macro paradigm where short-run fluctuations were separate from a long-run trend rate of growth. The proponents of the debate have taken up positions on whether the short-run mark-up is pro- or counter-cyclical. If marginal cost rose as output expanded, variability in prices should exceed that in output, with prices smoothing output and absorbing shocks. The observed larger variability in output becomes difficult to explain. If marginal costs were constant or desired mark-ups counter-cyclical the firm could absorb demand shocks by increasing output. If marginal costs are increasing, so that the firm's demand curve for labour slopes downwards, price must rise or real wages fall, for the firm to supply more output. But real wages are observed to be pro-cyclical. It is a problem in microfoundations to reconcile Keynesian output variability in response to demand shocks, with optimising behaviour by firms. Establishing the cyclical properties of the mark-up would contribute to this. The mark-up is a real or relative price. While Keynesian demand effects have long been explained through rigidities in nominal prices, it is now recognised that for such effects to persist there must be real rigidities [see Blanchard and Fischer 1989, ch 9]. The European school of general equilibrium macro-economics, popular in the 1970s, has been widely criticised for the arbitrary nominal rigidities on which its results depend.

In order to link the mark-up to medium-run growth fluctuations, this paper makes

a useful distinction between the short- and medium-run mark-up. In the medium run, as all factors are variable, account must be taken not just of short-run marginal cost, but of the returns to scale. The other reason the mark-up is important is that it is also the profit share, and there is a close interaction between it and medium-run growth. Recent work on difference stationarity in time-series of major macro-economic quantities has opened up the possibility that fluctuations are not restricted to the short-run, and can also affect growth. If a time series is difference stationary it means that shocks have permanent effects on the level. There can be hysteresis or path dependence. Earlier growth was thought to depend on a trend determined by long-run supply factors, while fluctuations were purely temporary. In the real business cycle literature, all fluctuations and growth are long-run and driven by shocks to technology. In this paper, as in the New Keynesian literature the possibility of multiple equilibria and endogenous cycles allows the short-run to influence the long-run, or medium-run growth cycles can exist.

In the Indian economy cycles have been more medium-run in character and have taken the form of periods of higher and lower growth, as compared to short-run fluctuations in employment that have been analysed so intensively in the west. Indeed, for a labour surplus developing economy, growth is the major issue, not short-run fluctuations. A model driven by medium-run investment savings dynamics generates multiple equilibria and growth cycles [Goyal 1994] in capacity utilisation and the mark-up. It also gives restrictions on the medium-run mark-up of a representative firm. The restrictions provide a justification for using the mark-up as the firm's decision variable, and a theoretical rationale for a macro aggregative demand variable entering the price-cost or mark-up equation. They help in solving the two identification problems plaguing empirical estimations of industrial pricing: (i) Identifying the firm's supply

curve when both demand and supply are changing, and (ii) separating changes in marginal cost from those in the mark-up.

The basic problem is that data alone cannot distinguish between changes in the firm's true marginal cost and those in the mark-up. If costs of adjusting prices lead to nominal rigidities the mark-up would fluctuate more. In the medium to long run there is real rigidity, if the mark-up adjusts to a relatively constant desired value. Even so, rigidity of real and nominal prices is not the ultimate cause of fluctuations in growth. Real rigidities may be an optimal response to the nature of the dynamic adjustments to shocks. Indeed, as Keynes insisted, full wage-price flexibility may deepen a recession. Restrictions from the dynamic theory help to get around the identification problems that otherwise plague a single equation format.

Starting from theoretical first principles and using the general to specific error correction methodology (ECM), a mark-up change equation is specified and estimated at the two and three digit industry levels. It is used to (i) provide a test of the theoretical hypothesis of a mark-up that is counter-cyclical but shows little variation over the medium run, (ii) examine the effect of aggregate demand on industry supply, and (iii) see if the supply response differs across industrial sectors.

The structure of the paper is as follows: after reviewing the identification problems and linking neo-classical and mark-up pricing in the next section, the equation specification is developed and a brief comparison of ECM and cointegration methodology is made in Section III. Section IV presents the regression results and Section V concludes. Regression results are reported in the Appendix.

II Theoretical Background

Cost-plus-pricing models typically have a pricing equation such as:

$$p = (1 + m) C \quad (1)$$

Instead of equating price, P , to marginal cost, firms charge a mark-up, m , on costs. C. The debate is:

- (1) About the definition of the cost variable in equation (1). It is widely agreed (based on empirical studies of the firm), that it is prime or variable cost, comprising largely of wages and raw materials. The normal cost school argues that firms do not change prices when cyclical variations in costs occur. Instead, costs which are under the control of the firm, such as labour costs, are averaged over the cycle.
- (2) That there are costs to changing prices, so that some kind of lagged adjustment to equation (1) would have to be modelled.
- (3) Factors affecting the level and cyclical properties of 'm' itself. The level of the mark-up is most often related to industry structure, starting from Kalecki's degree of monopoly, to modern formulations where the mark-up covers fixed costs in Chamberlinian imperfect competition. Earlier writings in this field expected the mark-up to be constant, but there were theories where it was procyclical, as firms sought to raise cash for investment. As we will see, recent theoretical and empirical evidence suggests that it is counter-cyclical.

It is a tall order to distinguish empirically among the effects of changes in 'C', 'm' and of short and long run adjustments. That is perhaps why the debate is not resolved in spite of the countless papers that have been written in this field. It is an econometric identification problem to obtain the firm's supply relation in the face of demand and cost (supply) shocks, and interdependencies between demand and supply.

A similar identification problem arises in the neo-classical theory of firm pricing. If it can be shown that the mark-up is the firm's decision variable, and that it is chosen optimally, mark-up pricing becomes compatible with profit maximisation, and is not ad hoc. This is important because most empirical studies use mark-up pricing, and it has been found to accurately capture the firm's actual decision-making process. First, we show the conditions under which the price equals marginal cost rule can yield an identical empirical representation to the cost plus models. We find that important conceptual issues that need to be distinguished include the time horizon, the returns to scale and the slope of the marginal cost curve. We differentiate between a short-run where prices are constant, a medium-run where prices and capital stock are adjusting, and a long-run steady-state equilibrium. As we are concerned with aggregative empirical studies, adding up or product exhaustion must be satisfied. That is, factor payments must add up to total product.

Even though at disaggregated levels there may be different degrees of competition, in aggregative empirical studies the firm is treated as a standard monopolist, facing a downward sloping demand curve. From the first order conditions of profit maximisation, the firm's optimal long-run price turns out to be a constant mark-up on long-run average cost [see Maccini 1981]:

$$p = (1 + m) W_1^a [(r + \delta)W_2]^{1-a} \quad (2)$$

Here a is the labour coefficient of a constant returns to scale production function, W_1 is the wage rate, W_2 is the price of capital goods, r is the interest rate, δ the depreciation rate, so that $(r + \delta)W_2$ is the rental rate. The price-cost margin (PCM), τ , is also the profit share:

$$\tau = \text{PCM} = \frac{Py - vy}{Py} = (r + \delta) \frac{K}{Py} \quad (3)$$

where y is output, v is variable cost per unit, and K the nominal capital stock. Under competitive conditions, excess profits would be zero, and the third equality in equation (3) would hold, where r is the competitive rate of return. Even with monopolistic competition excess profits would be zero in equilibrium, if there was free entry. However, in this case labour would be paid less than its marginal product. The excess share of capital would compensate for the fixed costs that the firm chooses to carry. Other market structures would allow pure profits to exist, but the PCM would be constant only if marginal cost is constant and therefore equal to average cost. The PCM is related to m as in equation (4).

$$\tau = \frac{m}{(1 + m)} \quad (4)$$

Pricing with a constant mark-up is consistent with long-run optimal pricing if there are constant returns to scale and short run, if marginal cost is constant. The next question becomes, how to measure marginal cost in different time dimensions? While constant returns to scale may be a realistic assumption for the long run, with all factors variable, what is the firm's true marginal cost in the short to medium run, and is it constant?

In the new empirical industrial organisation (NEIO), as against the older structure-conduct-performance paradigm, it is recognised that economic marginal cost cannot be easily observed. The attempt is to infer marginal cost and market power, by estimating the behavioural equation (5), using which the firm sets price and quantity.

$$P = D_1(\cdot) Y = C_1(\cdot) \quad (5)$$

In the equation, the left hand side measures marginal revenue, and the right hand side marginal cost. Each is regressed on the appropriate price, quantity, shift and random

variables, and competing hypotheses regarding market power tested.

An interesting example of this indirect approach, from a macro-economic perspective, is that of Hall (1986). He built upon the fact that measurements of total factor productivity, using the Solow growth accounting equation, always show procyclical residuals. Possible explanations for this could be (i) that technology shocks are correlated with the business cycle (as in the real business cycle literature), or (ii) that firms have market power so that price exceeds marginal cost. The first has not been validated empirically, while market power is widespread in modern industry. In that case, assuming a fixed mark-up, an estimate of the price/marginal cost ratio, μ , is obtained from equation (6). In the latter, the change in output is linked to that in labour input, n , or the hours of work. The revenue labour share ($W_1 n / Py$) is α , F_L is the marginal product of labour, θ is the constant and β the random part of productivity growth.

$$\Delta y = \mu \alpha \Delta n + \theta + \beta \quad (6)$$

$$P = MC = \frac{W_1}{F_L} \quad (7)$$

$$MC = W_1 \frac{\Delta n}{\Delta y - (\theta + \beta) y} \quad (8)$$

$$P = \mu MC \quad (9)$$

$$\text{or } \frac{P}{\mu} = W_1 \frac{\Delta n}{\Delta y - (\theta + \beta) y} \quad (10)$$

Equation (6) is derived from the price equals marginal cost condition (7), by considering a discrete change in input and output (8), and allowing price to exceed marginal cost, (9) and (10). We have $\mu = (1 + m) = (-\tau)^{-1}$. If the firm has market power, labour is paid less than its marginal product, so that μ multiplies the contribution of labour input to change in output in equation (6). Labour input is itself procyclical, so that as μ increases the procyclicality of the residual falls.

Thus Solow's pro-cyclical residuals are explained without recourse to pro-cyclical technology shocks. In the presence of market power, measured factor payments underestimate factor product giving pro-cyclical residuals. Hall assumes a constant μ , and estimates it at the level such that the residual is uncorrelated with the business cycle. Where Solow assumed price equals marginal cost and obtained pro-cyclical residuals, Hall assumes that technical progress consists of random deviations from a constant trend, and obtains a positive mark-up. The method implies that marginal cost is measured by observed variation in labour per unit output (the latter corrected for exogenous, or non-

cyclical, productivity increase), multiplied by wage. Equation (6) referred to a short run, with constant capital. It is also valid for a medium run, in which the capital stock can vary. It is only necessary that quantities are then normalised by capital.

Hall obtains high levels of the mark-up, at the two digit industry level and regards this as proof of widespread market power. He shows that this is consistent with zero profit equilibrium for monopolistically competitive firms with fixed costs.¹

Rotemberg and Woodford (1991) attempt to prove Rotemberg and Saloner's (1987) theory of counter-cyclical mark-ups, using a refined version of Hall's method. Instead of a constant mark-up, they take Hall's estimate as determining the latter's average value. They assume (i) a small elasticity of substitution between labour and capital, or a rising marginal cost, and (ii) random residuals. Solow's equation then generates counter-cyclical mark-ups for high levels of average mark-up. Their assumption of low elasticity of substitution, or rising marginal cost, is difficult to reconcile with excess capacity and a medium-run dimension where all factors can be varied.

We see here our old problem of distinguishing between changes in cost, mark-up, and demand. Hall (1991), and Rotemberg and Woodford make opposite identifying assumptions. The former takes the mark-up to be fixed or random and gets a falling marginal cost. The cyclical of the data is such that they alone cannot distinguish between the assumptions. There is no theoretical basis either, for the assumptions made of constant mark-up in one case, and rising marginal cost in the other.

If marginal cost is not constant and equal to average cost, or the mark-up is not counter-cyclical, or technology shocks are not correlated with the business cycle, the observed pattern of weakly pro-cyclical real wage [see Blanchard and Fischer 1989, ch 1], cannot be reconciled with a profit maximising firm on its supply curve. As demand increases, the firm would produce more only if real wages fell (the mark-up increased) if marginal cost is rising.

We seek to obtain some restriction from theory to aid in this identification problem. If the firm had fixed costs or excess capacity,² marginal cost would fall as production increased. The supply function is then indeterminate since it always pays a competitive firm to expand production. A counter-cyclical mark-up reimposes constant returns and a determinate demand determined production level is obtained. Equation (11) is the first order condition of a profit maximising firm with fixed costs. It is the marginal productivity equation that Hall used. Equation (12) constructs a hypothetical constant marginal productivity, F_L^* , and

constant marginal cost, MC^* . In that case the mark-up would be counter-cyclical. The firm's relative prices would fall in periods of high demand as the rise in its price would be less than the rise in nominal wages.

$$\frac{W_1}{P} = F_L (1 - \tau) \quad (11)$$

$$P = \mu MC^* = \frac{W_1}{(1 - \tau) F_L^*} \quad (12)$$

Most empirical studies of industrial pricing assume constant returns to scale. That seems to fit the data best. Indeed, aggregate data must satisfy product exhaustion. The latter is compatible with optimal pricing only if there is constant returns to scale. Our analysis reconciles IR and optimal pricing with generalised constant returns. In the presence of market power and fixed costs, labour is paid less than its marginal product, and constant returns maintained by a counter-cyclical mark-up.

Increasing returns lead to possible instability. Convexity and a constant marginal cost is restored with the behaviour of the mark-up. But why would a firm want to lower its mark-up when normalised demand is high? While the first order condition can give an indeterminate supply function, restrictions from stability generate a determinate supply representation for the risk averse firm, such that it maximises expected profits. The marginal equalities required for efficiency are not violated once dynamics are brought into the picture. Another way to understand this is that the static inefficiency is preventing an even greater dynamic inefficiency. Constant returns in the medium run are maintained by adjustments in τ . In that case, the neo-classical pricing decision of the firm can continue to be written as in equation (1), except that the mark-up would now be variable. It would be inversely related to output. The mark-up becomes the firm's decision variable. The argument is not restricted to a particular industry structure, but, in a non-Walrasian equilibrium, all firms have market power and the mark-up varies inversely with the elasticity of demand.

These considerations can explain the influence of aggregate demand variables on the mark-up and output decisions of the firm. Although each firm is small, and does not think that its decisions affect aggregate variables, yet the profit share, τ , affects savings-investment, and aggregate demand. In periods of high induced demand, the elasticity of demand would also be higher, making a fall in mark-up optimal. As excess capacity fell, excess profits required to cover its costs also fall. The instability that can accompany a very high accelerator is moderated by the behavior of mark-ups. That is, the low variation in mark-ups makes possible a large output response to a rise in demand. High investment allows the

continual expansion of capacity, its utilisation, and high growth.

A medium-run macro-economic model that captures growth fluctuations can thus generate restrictions for the pricing decision of the representative firm. An intuitive explanation is attempted here, details are available in Goyal (1989, 1994). The model has multiple long-run non-Walrasian equilibria, with excess capacity. In the presence of the latter, macro quantity variables enter the decision-making process of the firm. Aggregate demand is determined by the IS/LM curve. The requirement of smooth adjustment and convergence to equilibrium can generate an as if supply relation linking the mark-up to excess capacity.

Fixed costs are naturally associated with monopolistic competition. However, along adjustment paths, or in non-Walrasian equilibria, the optimal capital stock decision of a competitive or non-competitive firm would involve excess capacity. We use the latter in the sense of an excess of fixed production factors, so that short- and medium-run marginal cost is declining. But the firm optimally chooses to hold it. The reason is that as against the static monopolistic competition case considered in much of the literature, the firm's maximisation problem here is dynamic. The firm maximises profits over dynamic adjustment paths approaching equilibria with excess capacity. The latter arises from the system dynamics. The explanation for both excess capacity and excess profits is more general. It is not dependent on, although it does not preclude imperfect competition. The level of τ is determined in the long-run equilibria, and its rate of change along the medium-run adjustment paths. In Hall (1991) the rate of change of τ is indeterminate, in Rotemberg and Woodford (1991) its level. While disaggregative τ would be affected by industry structure, aggregative variables would also influence it.

The mark-up 'm' is monotonically related to the profit share, τ . Equation (3) shows that τu is the rental rate, where $u = y/k$. The discounted present value of the former determines investment, as in the 'q' theory. Savings are also a function of τu . So that aggregate demand is a function of τu . Aggregate supply can also be shown to depend on these two variables, with τ as the decision variable of the firm

$$\tau = g(\tau, u)$$

$$g_\tau < 0, g_u < 0, |g_\tau| \text{ large}, g_{\tau\tau} < 0 \quad (13)$$

A risk averse representative firm would maximise expected profits if τ was changed as in equation (13). A superscript dash denotes a time derivative, and a subscript

a partial derivative. The restrictions, on the partial derivatives, are obtained by examining the dynamic flow of the reduced form dynamic system in time rates of change of τ and u . The restrictions imply a counter-cyclical mark-up that shows only small variation. They allow smooth medium-run adjustment paths, that approach a long-run steady-state, to exist. The reason is largely that recessionary paths are avoided. Risk aversion imposes a preference for more average profits. Instability associated with an accelerator type response of investment to rising profits is prevented.

The testable implications of the theory, germane to our purpose in this paper are that the medium-run mark-up would be counter-cyclical but have small changes. Further, the dynamic specification of the rate of change of τ is directly derived from the firm's profit maximisation. Then, reflecting 'deep' parameters in the sense made precise by Lucas, the supply relation is less likely to suffer from dynamic misspecification. In addition, identifying restrictions are obtained that allow the mark-up to be specified as the decision variable with an expected a priori negative sign of an activity variable. The latter should reflect macro-economic, rather than firm level factors. Goyal (1989) tested and confirmed the implications for the aggregate mark-up in a simulation model. The current paper tests the hypotheses at more disaggregated levels in an econometric study. Even disaggregated studies of industrial pricing rarely refer to a firm or single product. Product level substitution effects are aggregated out, and macro effects predominate.

As argued earlier, if there is constant returns or marginal cost is constant and equals average cost, neo-classical optimal pricing is equivalent to cost plus pricing. Domovitz et al (1988), repeat Hall's (1986) calculation, with adjustment for raw materials. They find that estimated mark-up is close to the PCM. Theoretically, the two would be the same if the marginal product of labour is equal to its average product, or if, as in our theory, the mark-up varies to make it so. Domovitz et al also regress the PCM on a number of contemporary variables, to find out the influence of industry structure and activity variables on it. They report that in more concentrated industries, it is more pro-cyclical. Counter-cyclical mark-ups need a broader theoretical base than that of monopolistic competition.

Before discussing the specific functional forms that were estimated for the Indian economy, it is useful to briefly review a few well known studies of industrial pricing for the latter.

All three estimate variants of a basic equation regressing industry price on unit

cost, and seek to establish the cyclical properties of the mark-up. But the arguments outlined above imply the criticism that unit costs do not measure the true marginal costs. If the assumption of constant marginal = average cost is made, as in Balakrishnan (1992), there is no theoretical justification for an activity term in the price-cost equation. Madhur and Roy (1986), estimate an equation that intensifies the problem of distinguishing between changes in cost and mark-up, since the two terms appear together. While the latter find the mark-up to be pro-cyclical, the former, in an error correction framework, that perhaps picks up medium-run effects, obtains a counter-cyclical mark-up.

Chatterjee (1987) finds that pricing is cost-plus, or that the mark-up is fixed. In her price-cost equations the capacity utilisation term often has a negative sign, and is significant when costs are normalised, again perhaps picking up medium-run effects. She rationalises away the negative sign, by saying that as costs are likely to be counter-cyclical in India, using normalised costs would create an illusion of a counter-cyclical mark-up.³ Our point is that it is not an illusion, but a deliberate choice. She also shows that the behaviour of aggregate mark-up can be an artefact of aggregation, so that disaggregated estimates are required.

These studies were all painstaking and usefully extended the research frontier, but they point to the need for a still more careful, theoretical and econometric specification of the estimated equations. Perhaps then more light could be shed on the thorny identification problems we have been examining.

III

Equation Specification

In order to test the hypotheses set out in the last part of Section II, regressions were run of the change in the PCM on its own lagged values, and on 'u'. Empirically, implementable equations are derived from the continuous time dynamic model in the following way. The dominant medium-run trajectory in τ u space is expected to be downward sloping [Goyal 1994], so that:

$$\tau_t^* = g - hu_t \quad (14)$$

The mark-up will approach its medium-run value gradually, as prices adjust with a lag. It becomes natural to use an error correction mechanism (ECM). In the latter, disequilibrium is corrected over a number of periods. Optimisation with adjustment costs can lead to such behaviour. The 'general-to-specific' (GTS) procedure of Hendry (1985) begins with a general autoregressive distributed lag model:

$$\tau_t = A(L)\tau_{t-1} + B(L)u_t + \varepsilon_t \quad (15)$$

Our version is:

$$\tau_{t+1} = \sum_{j=0}^n \tau_{t-j} + a - c u_t + \varepsilon_t \quad (16)$$

The general-to-specific procedure of making transformations, and dropping insignificant lags after empirical testing, gives the final equations chosen for estimation:

$$\Delta \tau_t^m = b\tau_{t-1}^m - cu_t + \varepsilon_{1t} \quad (17)$$

$$\Delta \tau_t = b\tau_{t-1}^2 - cu_t + c_{2t} \quad (18)$$

$$\Delta \tau_t = a + b\tau_{t-1}^2 - cu_t + \varepsilon_{3t} \quad (19)$$

where τ^m stands for a three-year moving average, and ε_t is a random error term. Equation (17) captures medium-run adjustments in ' τ '. The medium-run is therefore defined as a period of three years. The difference equation (17) will be stable⁴ if $0 < b < 1$. Regression (18) allows (i) comparison with the literature, which sometimes examines the adjustment of price to cost in the short run, (ii) examination of the difference between the short- and medium-term adjustment of τ . In the presence of menu costs and other short-run price rigidities, equations (18) and (19) are not expected to be behavioural, but to show the short-run impact of shocks. The short-run refers to one year. Equation (19) allows econometric tests of the significance of an intercept term in the absence of strong theoretical restrictions on its presence or absence.

The coefficient b is a priori expected to be larger in equations (18) and (19). It could even be greater than one, but in that case we would expect it to be positive, since otherwise explosive fluctuations may occur, especially with the non-linear τ term. While the medium-term trajectory is approximately linear, the non-linear τ term gives a better fit in the short-run equations. Our analysis provides a theoretical rationale for the inclusion of a capacity utilisation variable, with an expected a priori negative value in the medium run. In the short run the expected sign would depend upon (i) the pattern of price adjustment, (ii) whether demand or supply shocks predominate. This is explained in Section IV. Domovitz et al regress the PCM on a number of cross-sectional industry specific variables, such as the degree of concentration, unionisation, etc, that are expected to affect the industry mark-up. Given the small number of degrees of freedom, we chose the simplest possible specification. The lagged τ terms can be expected to pick up industry specific effects on the change in mark-ups.

In deriving the estimated equations we have followed an ECM methodology, combined with strong restrictions from theory. The general ECM format which can be derived from equation (15) is as

follows.

$$\Delta \tau_t = \text{lags } \Delta \tau_{t-1} - z_{t-1} \quad (20)$$

$$z_t = \tau_t - \tau_t^*$$

In this the long-run relationship $\tau = \tau^*$ is separated from the short-run adjustment. The alternative econometric method for separating long- from short-run influences, in time series is that of co-integration. This involves testing for the long-run relation between variables (that is, if they are co-integrated).⁵ In step two this is imposed on the estimating equation so that it separately measures adjustment to short-run changes and equilibrium error. The problem with this method is that the test for estimating the unit root⁶ or degree of co-integration is of very low power. It also cannot distinguish between a unit root and a near unit root or non-linear trend. Engle and Granger (1987) show that if two variables are co-integrated then an ECM representation (20) exists and vice versa. The advantage in this procedure is that the variables are all of the same order of integration.

In contrast, in an ECM model obtained using the GTS procedure, the regressors may not all be stationary, or may be of different orders of integration,⁷ so that in small samples the ECM model derived from the GTS procedure may differ from that obtained from the Engle-Granger method. Where the variables are not all stationary, the asymptotic distribution of the OLS estimators does not approach a normal distribution, so that the t-tests are in doubt. In our case theory helps to resolve the question of whether the variables should be in first differences or levels, so that we may expect the test statistics to have the desired properties. The equations being derived directly from the maximising decisions of firms, the chances of dynamic misspecifications are minimised.⁸ Further, 'valid' ECM models with coefficients of ECM terms that are significant and correctly signed, are obtainable from the GTS procedure, even when tests support co-integration. GTS will not lead to error even in this case [Muscatelli and Hum 1992:12]. In small samples the problem of bias in the first stage of the co-integration procedure may be more significant.

The recent literature is quite critical about the substantial contribution of co-integration techniques to macro-economics. Cochrane (1991) opines that its main use has been as a representation teaching us to be careful in modelling trends, levels and first differences. The decision on such modelling should ideally come from theory and not the statistical testing. The major decision is the number of lags. Once these are decided, the different equations can be obtained as transformations of each other. Muscatelli

and Hum conclude that co-integration does not offer any shortcuts to estimating dynamic time series models. A general criticism from Summers (1992) is that empirical work based on complicated statistical techniques has made only methodological and no substantial contribution to our understanding of the economy. Often tests are reported for small samples when only the asymptotic distribution of the test statistic is known, as in Madhur and Roy's use of the J test.

As τ is a ratio it would be expected to show mean reversion (stationarity in levels) and can always be written as an ECM. However, given the possibility of multiple long-run equilibria between u and τ [Goyal 1994] that the former are not expected to be realised, and the non-linearity involved, there is a problem not only of distinguishing between the short- and long-run but also between multiple long-run equilibria. There are two means involved, although they may be quite close. Therefore, mean reversion or stability of long-run equilibria is not expected to be realised trivially, and needs to be demonstrated. Granger (1993) has made a recent attempt to address these problems and define a generalised unit root process as a dynamic attractor. At present co-integration tests are even more doubtful in the presence of non-linear and breaking trends. In addition, the sample available is small. We chose to use GTS and simple estimation techniques, and specify different equations for the short- and the medium-run behaviour of the mark-up. Identification is achieved using theoretical concepts.

Our theoretical hypothesis, allows us to reconcile constant marginal cost with increasing returns, and to use τ as the firm's decision variable. The other identification problem is that of (i) distinguishing between the demand and supply curve, and (ii) the simultaneous equation bias likely to arise in estimating a single equation. If the mark-up in turn determines u , the latter will be correlated with the error term. The coefficient 'c' is likely to be biased downwards, if an adverse shock causes both quantity to fall and price to rise. Regarding (i), from the theoretical hypothesis we expect the supply relation to be relatively constant in the medium run [see Goyal 1995a, b], while the demand curve would shift. In that case the former could be identified. The supply relation modelled here relates the firm's desired profit share to excess capacity, and is likely to be constant. Following Hall (1991), we can say that the relation between price and quantity identified by a demand shift that is orthogonal to supply shocks, would be the supply relation. In any case both the demand relation and the medium-run adjustment path are also expected to be downward sloping. It is possible that the supply relation is upward sloping. Whether

our equations are estimating the demand, supply relations or adjustment path, failure to obtain a negative coefficient for the 'u' variable would be a rejection of our hypotheses. As the size of the sample is very small, we do not give much credence to the values of the estimated coefficients. The signs are enough to test our hypothesis.

With respect to (ii), we use the aggregate output/capital ratio in the estimating equations. This serves as an instrument which is independent of industry level supply shocks, but correlated with industry demand. Domovitz et al (1986b) explicitly test for the simultaneous equation bias. They compare OLS and 2SLS estimates in a mark-up equation and find that the single equation is quite robust. The bias is small. We also estimate the equations with an industry index of capacity utilisation in order to construct a test of the relative importance of industry versus aggregate demand variables on industry supply. If what is being estimated is the adjustment trajectory, and neither demand nor supply, there would be no simultaneous equation bias.

IV The Regressions

Equations (17), (18) and (19) were estimated by OLS, for the period 1973-74 to 1985-86. It is a preliminary exploratory study, based initially on compactly available data in Chandhok et al (1990).⁹ Six industrial sectors at the two digit level, representing consumer, intermediate and capital goods were chosen. Subsequently, regressions were also run at the three digit level of disaggregation for each of these sectors, with data from the *Annual Survey of Industries*. Results are reported in Tables 1A, 2A and 3 respectively, for the six industries at the two digit level. Table 1B reports equation (12) for selected industries at the three digit level, while 2B reports (13) and in a few cases (14). For reasons of space, only regressions with significant F tests are reported at the three digit level. In almost all the regressions (the rest are available with the author) the coefficients were of the expected signs. The data base and industry key is in the Appendix. Given the very small sample length the results are surprisingly informative, and allow some tentative conclusions to be drawn.

(1) The coefficient of u is negative and significant, in both the short and medium run. The latter confirms counter-cyclicality of the medium run mark-up. In the short-run regressions, in a very few cases, the coefficient of u is positive, but then it is insignificant.

The change in the mark-up in the short-run exceeds that in the medium run. This implies that there is indeed lagged adjustment

in prices, perhaps due partly to menu costs.¹⁰ If prices are relatively inflexible in the short run, we would expect an adverse supply shock to lead to a fall in mark-ups and output: short-run mark-ups would be pro-cyclical. A fall in demand would imply pro-cyclical short-run mark-ups if marginal cost was falling (as mark-ups would fall with output; this is our case), and counter-cyclical if marginal cost was rising. The estimated coefficient of capacity utilisation in the short-run equations is also negative. What is the inference regarding the nature of the shocks.

In the estimation period, there were a number of supply shocks (oil price increases and fluctuations in agricultural output). On theoretical grounds, given excess capacity or fixed costs we expect marginal cost to be falling. If an adverse supply shock leads to an adverse demand shock, a counter-cyclical short-run mark-up can be reconciled with a falling marginal cost. There are a number of mechanisms that can cause such a possible interdependence between supply and demand. One such is the effect on the investment decisions of the firm, another is through changes in government budget and expenditure decisions.¹¹ There is some evidence that in the Indian economy industrial output responds with a lag to changes in agricultural output. As industrial prices also adjust with a lag, mark-up would fall in the event of a supply shock, subsequently, output would fall and mark-up rise. This could explain the counter-cyclical of the short-run mark-up and also reconcile the observed fluctuations in calculated mark-up series with their relatively constant trend. In the theoretical model being tested in the current paper [Goyal 1995b] we expect the supply relation to be relatively constant in the medium run, with supply shocks being almost fully converted into changes in demand.

(2) In line with the a priori argument the coefficient of τ is positive and significant. It is much larger in the short run and less than one in the medium run. This corroborates our stability hypothesis.

(3) The macro capacity utilisation variable is indexed T and the firm level demand variable C. Regressions with the former perform better than with the latter variable, at the two digit level, and in the medium run at the three digit level of industry disaggregation. The coefficient of $u(\text{indexed T})$ is also larger and more significant than that of $u(\text{indexed C})$. Although regressions using C may be suspect because of the simultaneous equation bias, the regressions do suggest that macro demand dominates local industry demand at two digit levels, and over the medium run at three digit industry levels also. Including both in the same regression, Domowitz et al (1986a) find that aggregate demand effects are four times larger, and

that total demand effects explain more than 50 per cent of the change in the PCM.

(4) A simple equation was estimated, and no attempt was made to pick up other industry structure variables. These must be specially important at more disaggregated levels. Even though neglecting them is justifiable given our limited objectives, the low R^2 for paper and cotton textiles¹² at the two digit level, and for many industries at the three digit

level, suggests that micro inter-industry price effects and other industry structure variables, including price control, may add to the explanatory power. Although some of the regressions for the consumer good industries are actually better at the three digit level, we can tentatively conclude that the structure of the industry, including the degree of competition, may have an important role in explaining the change in mark-up for

consumer goods industries. This is true also for the transport sector, which includes many consumer durable goods.

(5) Table 3A shows that the intercept term is not significant, and the regressions using it are poorer. So it is dropped and we concentrate on the results without the intercept term.

V Conclusions

A dynamic aggregate demand-supply based model of a representative firm yields restrictions on the firm's pricing decisions. These provide a theoretical reconciliation of generalised constant returns with an activity variable affecting the firm's pricing decision. The regressions corroborate the theoretical hypotheses. Both short and medium run mark-up are counter-cyclical. The short-run response of the mark-up is greater than the medium run. This suggests that (i) the conditions for stability are satisfied, (ii) there is some short-run nominal price rigidity, and (iii) the mark-up shows only small changes over the medium run. The hypothesis is found to generalise to the level of disaggregated industry. There is some evidence of the importance of aggregate demand effects for industry supply decisions, providing a macro-foundation for industrial pricing.

The observed stability of the mark-up provides a micro-foundation for structuralist macro theories. In post-Keynesian theories firms raise the mark-up to generate more cash for investment. We find that in periods of high investment and growth the mark-up would be falling. Product wages and consumer welfare would therefore rise. This is particularly true if productivity is rising and costs falling at the same time. The reforms can contribute to the latter, but for them to be fully successful high investment must be maintained. Over the medium run, as the supply relation we have examined is stable, the mark-up will just cover the cost of excess capacity.

Mark-up pricing has formed an intrinsic part of many macro-models, because it captures real world pricing behaviour. It has, however been attacked as ad hoc because it lacks theoretical underpinnings. We derive restrictions on both the level and rate of change of the mark-up from the dynamic profit maximising decisions of risk averse firms. The mark-up is a major component of the inflationary process. Understanding variations in it will help to understand inflation. Secondly, the mark-up is also the profit share, and as such affects both the savings and investment decisions, and influences medium-run growth or macro-economic activity.

An implication for policy is the possible stagflationary consequences of a demand

Note. t-values in parentheses.

Data

All variables pertaining to two digit industries from Chandhok et al (1990) and three digit industries from ASI, various volumes. Aggregate manufacturing output, y , and real capital stock, k , from Goyal (1989).

Calculations

u_i (indexed T) = y_i/k_i

u_i (indexed C) = $y_i / [(y_{it-1} + y_i + y_{it+1})/3]$

i indexes the two and three digit industrial sectors

$\tau_i = [\text{Gross output} - (\text{wages} + \text{materials} + \text{fuel})] / \text{Gross output}$

It is difficult to even define optimal capacity, let alone measure deviations from it. The two measures of capacity utilisation defined above are widely used in the empirical literature.

Symbol key for tables

33	Basic	=	manufacture of basic metals and alloys industries
330		=	iron and steel industries
331		=	foundries for casting and forging iron and steel
332		=	manufacture of ferro alloys
333		=	manufacture of copper
23	Cott	=	manufacture of cotton textiles
230		=	cotton ginning, cleaning and baling
232		=	printing, dyeing and bleaching of cotton textiles
234		=	production of khadi
235		=	weaving and finishing of cotton textiles in handlooms other than khadi
36	Elec	=	manufacture of electrical machinery, etc
360		=	manufacture of electrical industrial machinery, etc
362		=	manufacture of dry and wet batteries
364		=	manufacture of audio, telephone, telegraph, radar, etc, equipment and parts
31	Chem	=	manufacture of chemicals and chemical products (except products of petroleum and coal)
312		=	manufacture of paints, varnishes, etc
313		=	manufacture of drugs and medicines
314		=	manufacture of perfumes, cosmetics, etc
37	Trnspt	=	manufacture of transport equipment and parts
371		=	manufacture of locomotives and parts
374		=	manufacture of motor vehicles and parts
375		=	manufacture of motor cycles and scooters and parts
28	Paper	=	manufacture of paper and paper products
280		=	manufacture of pulp, paper and paper board (including newsprint)
285		=	printing and publishing of periodicals, books, journals, atlases, maps and sheet music directories, etc

squeeze, especially a cut in investment. In the absence of a supply shock, inflation is likely to be lower and growth higher when demand for industrial goods is high.

Notes

[I thank Arundhati Mundlay and Rina Sen who collected the data and ran the regressions. Renu D Narula and Lavina D'Silva helped with the typing. Useful comments came from two referees of the IGIDR DP series and participants of the faculty seminars at IGIDR, where this paper was presented. Special thanks go to Pulapre Balakrishnan and T R Bishnoi for detailed comments.]

- 1 The assumption of monopolistic competition has proved very useful in a number of recent stylised macro-economic models. The characteristics of this are fixed costs, free entry and market power due to product differentiation. In equilibrium there are zero profits, with the market power just covering the fixed costs. The firm chooses its price and labour and capital demand, taking aggregate demand as given. In the short run, the fixed costs allow an expansion of output in response to a demand increase, in the medium run entry causes a capacity expansion, without leading to the various business stealing effects possible under oligopoly.
- 2 Fixed costs refer to an indivisibility in any production cost, it could be advertising cost. Excess capacity refers to excess capital stock, and, in the absence of an indivisibility, is difficult to reconcile with static optimisation by the firm.
- 3 Normalised cost would fall less than actual cost as output rose, so that the difference between output and normalised cost would fall. Given India's quasi-closed economy, the predominance of agriculture, and considerable excess employment or labour hoarding, she expects a rise in agricultural output and a fall in its price to decrease raw material costs and money wages, as industrial output and labour productivity rise.
- 4 The solution in a difference equation of the form (12) would be $\tau_t = \tau_0 b^t + K$, where K is a constant. As $\tau_0 > 0$, if $b > 1$ the solution increases monotonically, $b < 1$ decreases, $0 > b > -1$ there are damped fluctuations, and if $-1 > b$, explosive fluctuations.
- 5 If there is a vector time series x_t , all the variables of which are integrated of order d , the series in x_t are co-integrated, if they can be written as $y_t = \beta' x_t$, and y_t is integrated of order $(d-b)$, $b' > 0$. Here β' is the co-integrating vector, and y_t gives the equilibrium error from the long-run relationship between the component series in x_t . If first differences of the components and y_t are stationary the ECM representation can then be written with the change in each component series a function of lagged changes in the components, and the equilibrium error.
- 6 A difference stationary process is said to have a unit root. A simple example is a random walk without drift $z_t - z_{t-1} = \eta_t$, where η_t is white noise, that is, a random variable, so that the mean, variances and auto-covariances of z_t are stationary and independent of time.
- 7 A stationary time series would have constant unconditional mean and variance. The order

of integration of a variable denotes the number of times it has to be differenced to achieve stationarity.

- 8 Desai (1984) in an interesting analysis of Phillips' original paper points out how much before the availability of ECM and cointegration methods, Phillips avoided dynamic mis-specification by (i) an averaging procedure that separated short- from long-run relationships, (ii) derivation of his equation from a micro-foundation of price setting firms competing for labour. Later versions of the Phillips curve neglected these features leaving them open to theoretical and empirical criticisms. However, the criticisms themselves also often suffered from neglect of (i) and (ii).
- 9 In 1973-74 a change was made by the Central Statistical Organisation in the classification of industrial sectors. Therefore a commensurate time series at the two and three digit level is not available for the period before 1973-74.
- 10 Both nominal and real price rigidity is required to explain the cyclical behaviour of prices, wages and output. Theoretical explanations of the former range from Okun's idea of not spoiling customer markets, to current 'menu cost' theories, where the envelope theorem is used to show that it is optimal for a firm to keep prices fixed in the face of demand shocks, given small costs of adjustment. There are also efforts to study the dynamics of price setting, including endogenisation of the lag in price adjustment.
- 11 Bose (1993) has a model in which the procurement price of foodgrains is set in the beginning of the period. In the event of an adverse supply shock, the farmer decreases sales to the government, so that the market supply curve is unchanged. The effect on the government's budget may then cause a shift in the demand curve.
- 12 Chatterjee (1989) also finds different price setting behaviour in textiles and paper, which she explains by supply side industry characteristics. Prime cost is acyclical in both, as compared in counter-cyclical for other industries. While for paper this is true for both components of prime costs, for textiles labour costs are pro-cyclical but they form only a small part of prime cost. The wage component of labour cost in textiles is higher, there is less labour hoarding, and higher elasticity of employment with respect to output as compared to other industries. Both have a higher share of piece rates in employment so that money wages are pro-cyclical.

Privatisation and Public Sector Enterprises in India

Analysis of Impact of a Non-Policy

Geeta Gouri

The lack of a comprehensive policy on privatisation stands out in contrast to other aspects of the New Economic Policy. Perhaps this is politically expedient, but in terms of economic management and more so public sector management, the lack of a policy can result in unexpected outcomes which may not be all that expedient. This paper attempts to provide glimpses of the possible outcomes of the non-policy on privatisation, focusing on the fiscal, efficiency and intersectoral dimensions.

PRIVATISATION in India is still low key. Privatisation as 'sale or ownership transfer of public sector enterprises' is virtually non-existent except for stray cases of sale of small enterprises. Privatisation through disinvestment is limited to selling a portion of the shares of 31 select public sector enterprises (PSEs). Privatisation as a process that aims at reducing involvement of the state or the public sector in the nation's economic activities¹ by shifting the divide between public sector and private sector in favour of the latter has made considerable progress since the introduction of the new economic policy (NEP) in 1991. The process of redivide has been mainly through delicensing, relaxing entry restrictions and through equity funding of PSEs. Despite an obvious move towards a redivide there is as yet no comprehensive policy on privatisation. Disinvestment is part of fiscal policy while the redivide between public-private is a combination of fiscal policy, industrial and tariff policy combined with strands of policy on public enterprise reforms.² The sum total is non-policy on privatisation. Lack of a comprehensive policy on privatisation stands out in contrast to other policy declarations of the NEP.³ Perhaps such an approach is politically expedient. In terms of economic management and more so of public sector management lack of policy can result in unexpected outcomes which may not be all that expedient. This paper attempts to provide glimpses of possible outcomes under a truncated policy of privatisation. Three dimensions of a non-policy of privatisation have been selected for an analysis of the impact. They are: (i) fiscal dimension; (ii) efficiency dimension; (iii) intersectoral dimension.

The first dimension of privatisation namely, the fiscal dimension stems from the government's need to reduce the fiscal deficit. Disinvestment of shares in PSEs is directly attributable to the fiscal concerns of the government. Fiscal obsession as we shall see later seems to be an overriding concern in most policies towards PSEs. The issue is whether fiscal obsession is a good basis for a policy on privatisation. Privatisation for

efficiency is the second dimension. In a sense the efficiency dimension forms the crux of privatisation policy. The redivide in favour of the private sector is based on the view that resources will be used more productively as efficiency of PSE is at discount. The private sector subject to the discipline of the market is efficient.⁴ The issue is whether the same market discipline introduced by level-playing policies of economic liberalisation without ownership transfer will be effective for enhancing the efficiency of PSEs.

The third dimension of our impact analysis is on intersectoral linkages which have to be addressed by a policy on privatisation. Lack of policy reflects a unidirectional approach towards multidimensional effects. We shall highlight one major intersectoral linkage namely, the linkage between financial sector reforms and public sector reforms. This nexus is exemplified in two areas. Firstly, disinvestment of public enterprises and the entry of private enterprises has implications for the operational plans of financial institutions (FIs). In a sense, public investment has to be supplemented by FI investment. Secondly, in an open economy the monitoring role of FIs as major shareholders comes to prominence. As yet FIs have not displayed the required alertness. As financial sector reforms form part of economic liberalisation policies privatisation policy smoothen the nexus between financial sector reforms and public sector reforms.

I Domain of Public Sector Enterprises and Privatisation

The public sector consists of a complex hierarchical structure. Our analysis is however, confined to privatisation of PSEs. Hence, at the outset it is helpful to define the domain of PSEs. Public sector refers to all government activities including administration, running utilities, financial system of the government and commercial activities of the government. The PSE consists of departmental enterprises and non-departmental enterprises at the central and

state level. Departmental enterprises form part of the government financial systems but have separate accounts of income and expenditure. Their surplus or deficit is however, merged in the accounts of the departments of government e.g., the telecommunications, the postal departments. In the case of railways a separate budget is presented. Highway construction and maintenance, irrigation, providing housing, health and educational services also fall into departmental enterprises. Several state governments operate the government printing press and the distillery for manufacture of local liquor as departmental enterprise. Non-departmental enterprises refers to activities that are carried out by entities which are legally separated from the government and are made to maintain a separate account of all their financial transactions and to set them out in the form of a profit and loss account. These enterprises were set up either under the companies act or under special statutory provisions. We designate the two groups of PSEs into: (a) public sector enterprises non-departmental (PSEND) and (b) public sector enterprises departmental (PSED). Sometimes PSENDs are further classified into financial and non-financial public sector enterprises. Unless specified PSENDs do not include financial institutions and insurance companies but some financial services such Indian Railway Finance Corporation are included.⁵ While public sector activities other than enterprises are financed from the government budget, most PSENDs are not always entirely dependent on budgetary support from the government.⁶

Public sector in India is very large as can be seen from Table 1. The share of public sector in total capital stock was 46.2 per cent while value added was only 26.8 per cent.⁷ This difference between capital stock and value added is largely due to investments in administrative departments where the goods are more in the nature of merit goods or social goods. And partly due to inefficiencies in the public sector. The share of PSED in capital stock was 13.6 per cent while value added was 4.0 per cent. In the

case of PSEND the stock of capital was 20 percent while value added was 13.2 per cent. Investments in the public sector formed 9.4 per cent of GDP while savings were only 1.6 per cent leaving a savings-investment gap of -8 per cent. In Table 1 the savings and investment pattern as between public and private sector is given. Savings of both the public sector and of the private corporate sector are low. While savings in the private corporate sector have marginally increased over the six-year period they have declined to an insignificant amount (0.2 per cent) in the case of the public sector. Of significance is the dissaving of the government sector.

The PSENDs cover 246 central public enterprises (including six under construction) and about 800 state-level public enterprises. Investment in the central public enterprises in 1993-94 was Rs 1,59,307.40 crore. The major investments made in the public sector enterprises initially were in the capital-intensive basic and heavy industries whereas private enterprises catered predominantly to consumer goods. This clear demarcation of areas for public and private sector gets diffused by the 1970s onwards and recent investments in PSEs have been more in consumer durables.⁸ Hence, while public sector enterprises account for two-thirds of productive industrial capital their share in net value added is only one-third. The low value added is matched by low rates of return on capital employed. In 1993-94 the public sector as a whole only earned a rate of return on capital employed of 2 per cent while public sector enterprises (departmental and non-departmental) as a group displayed marginal improvement with a rate of return of 2.78 per cent.⁹ The net result has been a growing dependence on the exchequer for funds.

The process of breaking the public sector in India is interesting. It has not followed the traditional route of sale or divestiture. Instead, the move is more towards increasing the market share of private sector in different sectors. Conceptually privatisation can be divided into three broad modalities – Ownership Transfer, Management Transfer, Marketisation. Table 2 presents the three modalities with more detailed operational dimensions. Ownership transfer can be divided into partial and total. The table tries to bring out the numerous options that are available under ownership transfer. Each option involves weighing between the extent of government control and management autonomy. Foreexample, for highly sensitive areas governments may prefer to retain controlling interest. Control can range between 26 per cent equity ownership as under the companies act to 100 per cent equity control and ownership. In fact, most private enterprises themselves have less than 50 per cent private participation. More often

the so-called private owners hold less than 20 per cent equity leading to the search for a genuine private enterprise.¹⁰ Equally important is the form of dilution. There are various options open such as: (i) to the general public; (ii) sale to one group; (iii) to workers; etc. Management transfer may or may not involve ownership transfer and therefore, we categorise them into total transfer and partial transfer. Here also, as indicated in Table 2 a number of options are available. Marketisation, the third modality is a catch-all word which includes level-playing field for PSEs; relaxation of entry barriers to private sector in what were once the public sector domain; providing greater autonomy to PSEs by distancing from the government. In the tables given below we have divided marketisation into four categories. They are: (i) distancing of PSEs; (ii) management autonomy for PSEs; (iii) financial autonomy for PSEs; (iv) effect of economic liberalisation policies and (v) corporatisation.

The adopted modalities of privatisation in India is given in Table 3. It is clear from the table that the most commonly used route of privatisation is the modality of marketisation. This is followed by management transfer. Ownership transfer is limited to the disinvestment exercises for non-inflationary revenues for the fisc.

The modality of privatisation for PSENDs is on restructuring or marketisation.¹¹ Emphasis is on opening the flood gates of competition and also creating level playing field between public sector and private sector enterprises. This is clearly discernible from

Table 3. Ownership transfer and management transfer have been more subdued. Firstly, under the Industrial Policy Statement of 1991, areas reserved for the public sector have declined sharply from 17 to 8 to 6. Even in these six private sector participation is allowed on a case to case basis.¹² Secondly, the general liberalisation policies of macro-economic variables are all equally applicable to PSENDs in attempting to create a level-playing field for public-private sectors. Thirdly, efforts are being made to distance the PSE from the government and providing for managerial autonomy. All PSENDs are covered by the MoU. PSENDs boards have been revamped with one-third outside directors and government nominee directors restricted to one-sixth or a maximum of 2. Fourthly, a gradual withdrawal of budgetary support is forcing PSEs to tap external sources especially the capital market. Finally, a policy of disinvestment of public enterprises initially up to 20 per cent in select PSEs has been actively pursued. Thus what we may observe is that a gradual process of redefining the public-private divide combined with an even more gradual process of ownership transfer sums up the privatisation of PSENDs.

Corporatisation and encouraging private sector participation has been the main thrust of reforms in the PSEDs most of which are in the infrastructural sector. These include telecommunications, roads and highways, airports, road and air transport. In telecommunications, two metropolitan zones, viz, of New Delhi and Bombay have been converted into separate corporations. Private sector participation both in basic

TABLE 2: MODALITIES OF PRIVATISATION

Ownership Transfer		Management Transfer		Marketisation:
Total Divestment	Partial Divestment	Total Transfer	Partial Transfer	Distancing from the Government MOU
Private sector	General public	Subcontract	Control on the basis of share holding	Freedom pricing investment hiring
General public	Workers	Leasing	Joint ventures	Financial autonomy
Reprivatisation	Joint ventures	Franchising	Changed structure of the board	Liberalisation and deregulation of entry
	Rolling privatisation	Mandating		Corporatisation

services and value added services have been solicited. The power sector earlier consisting of generating and transmission corporations of the central government and of electricity boards (generation, transmission and distribution) at the state level is now open to private sector participation in both generation and transmission.¹³ In the case of railways a policy of partial subcontracting of services and franchising a few routes is on the anvil. New schemes of build-operate-lease-transfer (BOLT) for gauge conversion, track doubling, electrification, telecom project have been introduced. Similarly an own-your-own wagon schemes have been introduced. Postal services have allowed private parties participating in the courier services. In air transport private air taxis are allowed to operate in a few lines. Private airports are also under consideration. Roads are now open to the private sector. In the case of ports leasing of jetty facilities has been introduced. Private sector participation in infrastructure is a major policy in India. The huge financial dimensions of investing in infrastructure and the urgency of enhancing infrastructural facilities have been compelling factors towards encouraging private sector participation. The scope for competition and the dilution of natural monopoly elements have definitely helped in this policy of encouraging private sector participation and later privatisation.

It is clear that privatisation in India is slow. Major shifts have not taken place and as yet there is no move towards a comprehensive policy of privatisation.¹⁴ The process of ownership transfer is gradual either through equity dilution or through mobilisation of equity finances from the market. Policies that encourage private sector participation while simultaneously discouraging fresh public sector investment is the main thrust of privatisation. Nevertheless, the total balance between public and private sectors is however changing. The strategy for privatisation is 'greenfield privatisation'.¹⁵ Greenfield privatisation is the acronym for policies that encourage private sector participation.

II

Privatisation and Fiscal Dimension

The prime objective of disinvestment is mainly mobilising resources for the budget. Disinvestment of PSEs was first introduced in 1991-92 with the decision to disinvest up to 20 per cent of government holdings in select 31 enterprises. Initially only FIs and mutual funds were allowed to participate. Later the group was extended to include the public and foreign institutional investors (FIIs) and the limit was left flexible. A look at numbers and magnitudes does not present a positive picture. In Table 4 we have

TABLE 3: MODALITIES OF PRIVATISATION IN INDIA
First Modality of Privatisation-Ownership Transfer

Total Divestment	Partial Divestment
Total sale of public sector enterprises mainly in the state government enterprises, e.g., Hyderabad Alklyn, Mangalore Chemical and Fertilisers. Some of the sick units are now being considered for sale. An unsuccessful case of privatisation is that of Indian Iron and Steel Company.	Joint dilution of equity initially up to 20 per cent to financial institutions as a basis for meeting the fiscal deficit.
	Public sector enterprises are now permitted to enter the market and enhance their equity capital, e.g., Indian Petrochemicals Corporation, Industrial Development Bank of India, Industrial Finance Corporation, State Bank of India
	Joint ownership, e.g., Maruti Suzuki, Gujarat Ambuja. The pattern is to have 26 per cent foreign equity collaboration and over time become joint ventures.

Second Modality of Privatisation-Management Transfer

Sub-contracting	Leasing and Franchising	Professional Management
Sub-contracting of services such as catering and security in all public sector enterprises.	Equipment leasing is being considered by some of the public sector enterprises but this is more of a fiscal device	Changed participation of board of director both as a deliberate policy and as an outcome of equity dilution
Sub-contracting of labour-intensive manufacturing processes.	Leasing and franchising are the modalities being adopted in telecommunications and railways. The BOLT modus is being introduced with regard to wagons.	

Third Modality of Privatisation - Marketisation

Distancing	Management Autonomy	Financial Autonomy	Economic Liberalisation Policy Fall Out
Distancing through MOUs. All central PSEs and FIs have signed MOUs.	Administrative flexibility with regard to pricing as administered pricing is gradually phased out.	Tapping the capital market for fresh financial sources both debt and equity. In cases where equity instruments are used this leads to equity dilution	Economic liberalisation, deregulation and shifting the public-private divide.
No more subsidies and grants from the central budget.	Voluntary Retirement Scheme offered to some 70,000 workers.	FI's tapping the market for new sources of fund - both debt and equity.	Private sector participation mainly in power generation; air transport; road transport. Private sector participation in both value-added and basic services; Private sector participation in the construction of roads, bridges, highways and ports, Entry of private banks including foreign banks.
No access to directed credit at lower interest rates.	Restructuring with diversification and new investment strategies although the process and final approval still requires the approval of the concerned ministry. Restructuring of FI's to meet international capital adequacy and income provisioning norms.	Corporatisation of two divisions of the telecom department into separate metropolitan corporations. Corporatisation of ONGC, IDBI, IFCI either through a new statutory company or a unit under the general companies act.	All legal tax and tariff structures applicable to both public and private sector.

tabulated the proceeds of the disinvestment so far undertaken to the normal parameters of the budget. The table reveals the following:

- 1 The total amount of earnings since the start of the disinvestment works out to Rs 9,512.78 crore as per the budget papers.¹⁶ In the first year of disinvestment accruals were Rs 3,038 crore in 1991-92, Rs 1,961 crore in 1992-93; Rs 1,865.78 crore in 1993-94; Rs 2,291 crore in 1994-95 and Rs 357 crore in 1995-96 plus Rs 168 crore (not included in the budget papers). Obviously, the amounts from disinvestment are very small and even within the smallness there is a declining trend.
- 2 The most striking feature is the small amounts earned from disinvestment both in relation to total receipts and capital receipts of the central government budget. In 1991-92, the first year of disinvestment, receipts from disinvestment amounted to Rs 3,038 crore which works out to 2.9 per cent of total receipts and 7.8 per cent of capital receipts. This was the peak year. There is a steady decline thereafter. In 1992-93 out of the budgeted estimates of Rs 3,500 crore disinvestment was able to garner Rs 1,912 crore. In that year it works out to 1.77 per cent of the total receipts and 5.42 per cent of capital receipts. In 1993-94 the government planned for disinvestment earnings of Rs 2,500 crore (revised downwards from Rs 3,500 crore) but the amount actually earned from disinvestment was Rs 1,865.78 crore which is 1.42 per cent of total receipts and 3.36 per cent of capital receipts. In 1994-95 proceeds from disinvestment amounted to Rs 2,291 crore which is 1.43 per cent of total receipts and 3.33 per cent of capital receipts. In 1995-96 the government had budgeted for Rs 7,000 crore but disinvestment has yielded Rs 357 crore which is 0.20 per cent of total receipts and 0.54 per cent of capital receipts. The current budget hopes to mobilise Rs 5,000 crore from PSE disinvestment.
- 3 The negligible amounts from disinvestment are of limited consequence for closing the fiscal deficit. The peak of disinvestment in 1991 in relation to fiscal deficit is less than 10 per cent (8.36 per cent). This ratio declines to 4.88 per cent the following round, to 3.09 per cent in the 1993-94 disinvestment finally tapering off to 0.60 per cent in the current financial year. Suggestions that accruals from disinvestment be deployed for retiring the public debt is of marginal significance. Looking at disinvestment, accruals would help to retire 3.35 per cent of outstanding public debt in 1991 coming down to 1.45 per cent in 1994-95 and further to 0.16 per cent in the current

budget. The consolidated public sector deficit continues to hover around 10 per cent of GDP.¹⁷

- 4 A better fiscal picture does not emerge even when we look at disinvestment proceeds to financial assistance from budgetary sources and internal accruals. In 1991-92 disinvestment revenue to internal accruals, budgetary support and extra budgetary support to PSEs is 16.7 per cent but declines to 7.79 per cent in 1992-93 to 4.58 per cent in 1993-94 with a slight upturn to 5.67 per cent in 1994-95 declining steeply to 0.78 per cent in 1995-96. This suggests that the government is not inclined to using disinvestment proceeds to form part of the rolling public investment concept. Simultaneously, the declining trend in budgetary support reflects the withdrawal of government funds to PSEs. In search of resources PSEs will tap the equity route more frequently resulting in gradual dilution of equity. At present the amount of resources from outside sources is budgeted at Rs 9,670.75 crore.
- 5 A nagging doubt that remains is the choice of fiscal deficit as the basis for setting the limit to earnings from disinvestment. Perhaps, a more preferable alternative criteria for privatisation for fiscal resources is to conceive of public investment as a rolling concept such that if future investment rates need to be maintained sale of PSEs should provide the corpus of funds. In this case an interesting exercise is to get some dimension of the magnitudes of disinvestment required. Rather than taking fiscal deficit as the GDP it may be preferable to use investment in PSEs in the denominator. As

mentioned in the last section, the policy of greenfield privatisation or encouraging private sector into infrastructure prompts this enquiry. Presuming that infrastructure and core sector investments will continue to dominate whether in the public or private sector we can derive alternative estimates of the required disinvestment. Assuming that a minimum of Rs 90,000 crore will be required on annual basis then the amount disinvested should earn some proportion of the required investment. Investment in PSEs is Rs 1,59,307 crore (1994) with equity component of the central government of Rs 55,682.66 crore (face value). Assuming an average sales realisation of Rs 50 per share we need to disinvest at least about Rs 1,800 crore shares in order to meet future investment targets which is more than half the existing equity base!

- 6 Yet another way of looking at disinvestment accruals is to compare it with the lost earnings of government from interest and dividend foregone on its contribution to share capital and on loans. The owner having invested large amounts is entitled to receive the required dues on disinvestment. The government in the past has borrowed to finance its expenditure both developmental and non-developmental. Out of these borrowings 13 per cent has gone towards financing PSEs but interest receipts to the central government to the loan component varies between 1-3 per cent. Dividends paid by PSEs to the central government on its share capital has been a poor 1.5 per cent. In Table 5 we did a simple exercise for three years estimating the foregone interest and dividend. Disinvestment is

able to cover 24.53 per cent of this loss in the first year (1991-92). In the subsequent years the coverage by disinvestment falls to 12.10 per cent (1992-93) and 10.68 per cent (1993-94).

In terms of fiscal impact disinvestment has been marginal. In the case of disinvestment the amounts earned depend to a large extent upon the market realisation of the shares. A well known argument is that the shares have been sold at a low price and much more could have been earned by way of disinvestment. This is a debatable subject as much depends on the method of evaluation and prevailing market conditions.¹⁸ Our concern is more with the selected 31 PSEs for disinvestment. These are PSEs in the core sector.¹⁹ Among them the more profitable both in terms of current profitability and future potential profitability have attracted greater share dilution. This is expected. Although the PSEs were bunched together to prevent undue buying of a few PSEs, investors invariably prefer good companies that add weightage to the package. Nevertheless, policy of disinvestment for fiscal gains results in many contradictions. Firstly, milching profitable enterprises for short-term gains can in the long run leave the government with unviable PSEs accentuating in the process the fiscal deficit by increasing the burden on government revenues. Secondly, the selected PSEs were originally conceived as legally-created monopolies in the core sector. Economic liberalisation policies of tariff liberalisation and removal of entry barriers have opened the floodgates of competition. For these enterprises to face the competition a more comprehensive policy of privatisation which covers the dynamics of ownership and management transfer has to be worked out. Disinvestment to meet fiscal needs may not be exactly the most effective way. Instead disinvestment may create problems for management which can hurt their operational efficiency. Finally, equity dilution in core and strategic PSEs may be in contradiction to the present policy of retaining public ownership in these enterprises.²⁰

The persistence of a fiscal veneer for privatisation is interesting. Despite the small amounts earned from disinvestment and the poor performance at the bourses in terms of share price realisation the government has not attempted to evolve a comprehensive policy on privatisation. A few guesses can be attempted at this fiscal orientation. As a catalyst fiscal crisis can usher in paradigmatic changes. Structural adjustment reforms is one of them. The resistance to change presumably is less during crisis situations. But the limited amount disinvested only suggests that the fiscal crisis is perhaps not sufficiently severe for a policy of privatisation. The government prefers to

maintain only a fiscal veneer! Further, the choice of 31 profitable enterprises for disinvestment although attractive for disinvestment and for earning resources for the fisc may in the long run be contradictory by leaving the government with sick enterprises. Fiscal adjustments between the short and the long run show a mismatch defeating the fiscal objective. A rational policy of privatisation would view disinvestment from a different perspective. For example, the focus may shift instead to: (i) identify those enterprises that need to be retained in the public sector; (ii) assess the new areas for public investment; (iii) assess the extent of shares that need to be divested based on criteria such as natural monopoly characteristics, strategic, etc; and (iv) sell off the loss-making enterprises.²¹ Again, the fiscal cover for privatisation as an easier option is again difficult to accept. Criticisms on 'selling the silverware' or underselling PSE shares do not point towards a soft option. Given these doubts the fiscal veneer of privatisation combined with other measures in policy reforms of public-private redivide only suggests that in India, the preferred route for privatisation is that of *fait accompli* rather than of a deliberate policy. In which case, the outcomes can be both costly and unpredictable.

III

Privatisation and Efficiency Dimension

A major thrust of economic reforms under liberalisation is on enhancing efficiency in industry. Privatisation associated with ownership diversification should normally be among the package of reforms suggested to improve productive and allocative efficiency. Productive efficiency under

privatisation is based on the evidence that private firms attempt to minimise cost. The relative clarity of objectives and the incentive structure between principal and agent of a private firm is the basis for productive efficiency. Allocative efficiency, on the other hand, is dependent on competition making privatisation complementary to liberalisation. Hence, efficiency requires a blend of competition and ownership transfer.

Despite the fact that there is no policy of ownership transfer for efficiency the blend between public-private sector have undergone changes due to (i) private sector entry; (ii) gradual disinvestment; and (iii) corporatisation and mobilising of equity funds from the market. At the same time the strong emphasis on restructuring PSEs towards greater management autonomy under a hard budget constraint draws attention to the ownership versus competition debate mentioned earlier. Under the reforms programme a level playing field is being attempted to be created between public and private enterprises. The main components of the liberalisation process are: first, introducing competition through delicensing, lowering of tariffs, foreign direct investment. At present tariffs (import duties) have been lowered to an average of 65 per cent. Under the General Agreement on Trade and Tariffs (GATT) these tariffs as agreed will be reduced to an average of 30 per cent by 1997 and later to 20 per cent as recommended by the Taxation Committee Reform (Chelliah Committee Report).²² The lowest reduction has been on capital goods which imports direct competition to PSEs. Further the advantage of countervailing excise duties will also be phased out. Second, by moving towards a level-playing field for all industries including public sector enterprises in terms

of: (a) phasing out of subsidies – removal of differential interest rates; (b) removal of tax concessions on public sector public bonds; (c) phasing out of administered prices as also phasing out of purchase policy preferences, and (d) levy of corporate tax and income tax on a regular basis.²³ Third, foreign private investment is allowed automatically for equity of up to 51 per cent. This has implications for PSEs both in terms of competition in the respective fields and also for supply of capital and intermediate goods.

In this section an attempt is made to measure productive efficiency in terms of the performance of PSEs in the manufacturing sector. Our data covers central PSEs based on the official survey of the department of public enterprise (DPE). The DPE classifies PSEs in the manufacturing sector into 13 cognate groups which includes power and mining. The grouping does not strictly match the normal concept of manufacturing sector and requires reclassification when comparisons are made with the private sector. Restricting the analysis to the manufacturing sector was based on the following reasons. Firstly, most central PSEs were set up in the Second and Third Five-Year Plans within the framework of a legally created monopoly market of a restrictive trade or closed economy model. Thirty years later, these enterprises presumably have grown up and learnt to face competition. It is therefore, revealing to initially observe the reactions of these enterprises to competition and market forces. Secondly, these PSEs have limited or no equity dimensions. Value decisions of fulfilling social objectives are minimum and prevents the analysis from becoming diffused. Lastly, the analysis pertains only to profit making PSEs. Loss-making PSEs are candidates for the BIFR and their future strategy is predetermined. We have selected all enterprises which showed positive rate of return in the last three years of 1991-92, 1992-93 and 1993-94. More current data is not available for all PSEs. This leaves out enterprises which have fluctuating returns in these three years. Profitability is defined in the financial sense of net profit to capital employed and net profit to net worth.

A comparative analysis of public-private sector performance is also undertaken. Underlying this comparison are queries such as: (i) Are PSEs capable of functioning in an open (market-oriented) economy with the constraints of public ownership? (ii) Are there ways where public ownership gets limited and does not extend itself to sovereign considerations of social justice and equity? (iii) Is the threat of marketisation and competition effective in enhancing competition? But comparisons are misleading. PSEs and private enterprises are non-comparable

categories in terms of homogeneity of investment, product line and size. The public sector have been restricted to a few sectors where private sector entry permit was restricted if not debarred. Further the size of investments are very large. Comparable categories in the private sector are few. In order to overcome this problem comparable categories within the private sector have been selected. The data is based on the centre for monitoring Indian economy (CMIE) data. The CMIE data base has certain advantages. It covers both public and private sectors on a regular basis. The data is standardised. Yet, difficulties remain and at times the exercise in making comparisons seems valiant.²⁴

INDICATORS OF EFFICIENCY: PUBLIC AND PRIVATE ENTERPRISES

All indications as per the latest *Economic Survey* are that the economy is now poised on a buoyant phase. The present uptrend in industrial production while still reflective of past investment lags is now on a more positive trend. Comparisons between the public and private sectors shows that in terms of PAT sales both public and private sectors have performed more or less at the same level. But if we take profit after tax to net worth, the private sector has performed better. An interesting trend in the corporate sector is the increase in profitability from 'other income' which signifies that earnings are not from the mainstream investment. Changes in the depreciation rules have to some extent played a role in improving profitability.

Growth in fixed capital formation shows considerable fluctuations. After a dip in 1992-93 growth in fixed capital formation picks up. The fluctuating response is normal to expect in a period of transition when all reforms have either not been completed or

have yet to be activated. There are two facts that need to be noted. The uptrend in capital formation is much higher in the private sector reflecting the effect of greenfield privatisation. Further, the decline in capital formation was sharpest in the capital goods industry and the basic metals industry both of which has a sizeable public sector presence. The sharper decline in public sector companies as compared to the private sector is reflective of decreasing growth rates in these two sectors. The sharp increases in capital formation in the private sector unfortunately is concentrated in capital work in progress. Capital work in progress expanded more than three-fold in 1990-91 and more than doubled in 1991-92. At the same time, investment in plant and machinery expanded only 22 per cent in 1990-91, by 36 per cent in 1991-92 and by 55 per cent in 1992-93 and declined by 3 per cent in 1993-94.²⁵ The decline in productivity of capital has been steep in 1990-91. The marginal productivity of investments saw sharp declines to 0.93 in 1992-93 but is on the rise now. On the other hand, marginal productivity of public sector companies which showed some improvement in 1992-93 (1.19) declined sharply to 0.53 in 1993-94.

Aggregates tend to be deceptive. Instead analysis of the manufacturing sector (public-private) separately therein of inter-industry analysis has more significance. Performance profile of PSEs in the manufacturing sector is given in Table 7.

The table highlights the following facts:

- 1 Ratio of gross profit to capital employed for all public sector enterprises was 11.57 per cent in 1993-94. In the manufacturing PSEs the ratio was 11.63 per cent.
- 2 Ratio of net profit to capital employed for all PSEs comes down very steeply

TABLE 7: PROFITABILITY OF PUBLIC SECTOR ENTERPRISES

	1990-91	1991-92	1992-93	1993-94

to 1.81 per cent in 1993-94. If we take the ratio for the manufacturing sector alone it registers a massive decline of -178.46 per cent. Assuming that this is due to accumulated losses of (103) enterprises such as National Textile Corporation (NTC) and Heavy Engineering Corporation (HEC), we calculated the ratio for profit-making enterprises (61 in number). The net profit to capital employed in 1993-94 was 8.27 per cent. Very clearly some sectors and some units in each sector are bearing the brunt of loss making units. Only in the case of textiles are all the units in the red. An oft quoted variant of the inter-sectoral differences is the profitability of the oil sector. A separate sectorwise analysis is done later.

- 3 A possible reason for the drop in the net profit to capital employed ratio as compared to gross profit maybe due to increasing interest costs as PSENDs no longer enjoy the advantage of lower interest rates. According to CMIE, the average interest costs²⁶ at 9.42 per cent are lower in the public sector than in the private sector at 13.38 per cent. This is not strictly correct as in the CMIE study the difference between interest rate arises due to interest stipulated while the interest actually paid by the enterprises is not adjusted for.

- 4 The same study of CMIE²⁷ estimated that other income i.e., revenue from activities unrelated to the main line activity of the company, plays a remarkably important role in the profit before tax of the public sector. The issue of other income has raised an interesting enquiry into the efficiency of PSENDs. Reddy and Joshi have estimated other income deducted from earnings to equity and find from a study of 45 enterprises that the highest return earned in 1992-93 was 0.74 per cent whereas the lowest was in 1991-92 at -1.16 per cent.²⁸ To further examine the other income aspect we examined the ratio of other income to operating income as one way of assessing the efficiency of PSENDs in their specific line of operation. We looked at the aspect of other income to see if profits of these enterprises are derived from side-line activities. Unlike Reddy and Joshi we took other income to operating income for two years (1992-93; 1993-94). If this ratio exceeds 10 per cent than obviously the enterprise was not efficient in its main line activity. From the data the following enterprises earning large proportion of other income are: Sponge Iron (19 per cent; 24 per cent); Kudremukh (4 per cent; 10 per cent); NMDC (9 per cent; 16 per cent); Uranium Corporation (8 per cent; 10 per

cent); Nuclear Power Corporation (1 per cent; 36 per cent); Bharat Dynamics (23 per cent; 12 per cent); Semi-Conductor (19 per cent; 18 per cent); Goa Shipyard (21 per cent; 70 per cent); Garden Reach (13, 17 per cent); Hindusthan Latex (30 per cent; 101 per cent); NTC (209 per cent; 1200 per cent).

Eleven out of 65 profit-making public sector in 1992-93 earned other income, some of it disproportionately large. A few border line cases should also be noticed. These include Bharat Heavy Electricals (BHEL), Neyveli Lignite, Oil and Natural Gas Corporation (ONGC), Oil India, Bharat Electronics (BEL), Rajasthan Electronics. The aspect of other income requires further investigation and no categorical assertions can be made now. It is possible in a few cases such as Bharat Dynamics, NTC and Semi-Conductor other income have prevented low or negative rates of return.

SECTORAL PERFORMANCE ANALYSIS

As mentioned earlier inter-sectoral differences present a different picture of the performance of PSENDs in the manufacturing sector. We first present the financial performance of all 13 sectors. In order to present a concise manufacturing sector we later exclude the petroleum sector, and within metals and manufacturing, we have excluded mining which includes coal. Power has also been removed. A separate exercise is undertaken by removing the petroleum sector.

To examine the financial performance of PSENDs we have made use of four criteria. They are (i) average of net profit to capital employed of profit-making units for three years 1991-92, 1992-93, 1993-94; (ii) Average of net profit to capital employed of all units during the same period; (iii) Net

profit to capital employed for the profit-making units in 1993-94; and (iv) Average of net profit to net worth of profit-making units. The following observations can be made on the performance of profit-making public sector enterprises:

- 1 Five sectors out of 13 cognate groups showed profits in the two digit ratio whether measured by net profit to capital employed or net profit to net worth. They are minerals and metal, petroleum, pharmaceuticals and chemicals, consumer goods and agro-based industries. However, in accepting their performance it is important to keep in mind: (a) all these groups fall into the category of administered prices which makes it difficult to assess their performance; (b) they are still in the monopoly segment reserved largely for the public sector. Given these two caveats their performance in relation to alternative opportunity is not laudable i.e., the opportunity returns on investment (average of 10 per cent) barely matches the prevailing bank deposit rates let alone cover banks lending rates.
- 2 The next category of performers are steel and medium engineering units whose

TABLE 9 RECLASSIFIED PERFORMANCE OF PSEND IN THE MANUFACTURING SECTOR

average of net profit to capital employed is around 8 per cent closer to the group average of 9 per cent.

- 3 The losses of sick enterprises heavily pulls down the group average in steel, fertilisers, heavy engineering, medium engineering, transportation equipment, consumer goods and agro-based industries often bringing down the sector-average into the negative category. Within each cognate grouping only a few are profit-making. Textiles fall into a separate category where all the mills are sick. Restructuring of these mills have however eluded any solution despite repeated efforts by BIFR and AAFR. In the minerals and metals sector mining has pulled up the group average. Strictly speaking they should be eliminated from the manufacturing category except for aluminium units.
- 4 Looking at the average net profit ratio of three years to that in 1993-94 of the profitable units shows that there has been a decline in profits of steel, minerals and metals, pharmaceutical and chemicals, transportation equipment, agro-based and consumer goods. On the other hand there has definitely been an improvement often marked in the case of coal and lignite, power, petroleum, fertilisers, heavy engineering, medium engineering. In the case of steel the losses of a few units such as Indian Iron and Steel (IISCO) draws

done the average. Similarly the remarkable turnaround in the fertiliser sector is entirely due to National Fertiliser and FACT. It is therefore difficult to predict a trend upwards or downwards in any of the sectors.

- 5 An interesting observation from Table 8 is that the petroleum sector is really not the bulwark of PSEs profitability in the manufacturing category. The manufacturing sector has been further concised. We have in Table 9 retabulated sector analysis by excluding out the petroleum sector. It can be observed that NP/CE for the profitable units, the average of all the 13 groupings comes down by only 1 percentage point. On the other hand the impact of the petroleum sector is much more weighty when we take all the 164 manufacturing units. We also recategorised the manufacturing sector including petroleum and excluding mining to assess the financial performance. The percentage point comes down by 2 points. It is therefore mining units that pull up this sector and among them mention should be made of Kudremukh Iron Ore.²⁹ The burden of profitability in the manufacturing is therefore shared by all PSEs in the manufacturing sector and not merely of the petroleum sector.

How has the public sector performed in relation to the private sector? This is a difficult question to answer. The main problem as

mentioned is in trying to compare non-comparable categories. Hence, in making public-private sector comparisons a cautious approach is necessary. Using the CIMM data we have reclassified the manufacturing sector into eight categories to match the classification of public sector enterprises as given by the department of public enterprise, ministry of industry. Petroleum, coal, mining and power sectors have been left out. Heavy and medium engineering have been combined. The comparisons are between the industry average and the profitable public enterprises in that industry. The ratios estimated are profit after tax to networth and profit after tax to capital employed. Details are given in Table 10.

Table 10 clearly reflects the difficulty of comparing unlike with unlike. In terms of industry average even on an unweighted basis and selecting a sample from a sample study shows that industry picks up after 1993-94 and it is really in 1994-95 that the turnaround occurs. Surprisingly, the profitable PSEs have done better than the industry average confirming our earlier analysis that a few enterprises pull up the average. Yet, another observable feature is the lag in performance between the industry average and that of the PSEs. The lag maybe due to the delay in reporting the results.

Taking the financial ratios into account we can tentatively on the basis of three-year

TABLE 10 COMPARATIVE PERFORMANCE OF PSES IN THE MANUFACTURING SECTOR (NET PROFIT/NET WORTH; NET PROFIT/CAPITAL EMPLOYED)

Sector	Industry Average					Average of Profitable PSEs				
	1990-91	1991-92	1992-93	1993-94	1994-95	1990-91	1991-92	1992-93	1993-94	1994-95

period data surmise that in a competitive environment with a level-playing field, the existing public sector enterprises require major restructuring including privatisation and ownership transfer. Taking all the evidence together the response of PSEs to the reforms programme is still tentative. Despite the limited number of years since the structural adjustment reforms were introduced more attention needs to be paid to the following aspects. Firstly, the performance of the so-called profitable manufacturing PSEs ranges from moderate to poor. Even the so-called 'profitable' petroleum sector returns are modest despite the fact this is a price-created monopoly market. Secondly, within each cognate group there are only a few enterprises earning positive returns. Thirdly, in the strict technical sense, all units are in the competitive market segment and can no longer enjoy the luxury of officially created monopoly markets. If this trend persists they will have to take a more aggressive strategy.

Competition has played a contributory role for many PSEs egging them to restructure their enterprises within the given constraints of public accountability. Of interest is the strategic intentions of these enterprises in response to changing market conditions. All the star public sector enterprises like Steel Authority of India (SAIL), Bharat Heavy Electricals (BHEL), Hindustan Machine Tools (HMT), Bharat Electronics (BEL), Hindustan Aeronauticals (HAL), Bharat Earth Movers (BEML) have drawn plans to adjust to an open economy (Table 11). Most public sector enterprises have drawn up future strategies for diversification with efforts at globalisation especially through joint ventures with international companies. SAIL has also shown interest in diversification into a new field. Obviously, these are the initial responses to the reforms programme. In many cases intentions need yet to be put into operation. Perhaps more than anything else the government needs to draw up a policy of intervention and support besides a rational policy of privatisation. What is observable is the threat of competition in its embryonic stage needs to be sustained with greater management flexibility.

The issue is whether these PSEs who have responded through initial plans of restructuring and diversification can sustain their operations on a profitable manner in an open competitive economy without the support of government intervention? Of course, in large industries where economies of scale prevail, the imperfections of international competition invariably necessitate government intervention whether in the form of tariff protection or in terms of soft intervention such as economic diplomacy.³⁰ Of more direct concern is

whether these enterprises can function as commercial entities without the encumbrance of social objectives and accountability that government ownership enforces? The question is whether competition is enough or is it necessary to allow for privatisation with greater managerial autonomy? Furthermore, should the process of privatisation be an outright sale or gradual dilution of 'testing the water policy'? Even here is it possible to consider different levels of privatisation or government control?

Comparing the profitable PSEs with their equivalent private sector may perhaps be more revealing. In Table 12 we have taken the profitable PSEs and their equivalent private sector enterprise and tabulated the financial performance for the last five years.

Performance of comparable private sector enterprises as can be noted from Table 12 has been uniformly better except in the case of steel. In this sector in the initial stage the private enterprise TISCO did better than the PSE SAIL. Later, from 1993 the trend is reversed. This maybe due to the changed product mix due to deregulation of prices. Equally interesting is the way BHEL has picked to perform closely with its comparable Indian category Kirloskar Electric. In this category both Widia India and Asea Brown Boveri have done better than the other two. Their performance has also been evenly good. In the metals and petrochemicals sectors the private sector have performed better. There have, however, been years when performance of both public and private

enterprises are comparable. This may have been due to exogenous factors such as change in administered pricing to deregulation, reduction in tariffs or impact of general industrial growth rate.³¹ A financial analysis however needs to be supplemented by an analysis that will explain the existence of slack or X-inefficiencies prevalent in the two groups.

If privatisation must have an impact on efficiency the first requirement is a policy on privatisation that encompasses the following aspects. Firstly, the process of gradual dilution of equity combined with increasing access to the capital market for resources by the PSE will but see an erosion of government control. The issue is how much government stake should be retained in these enterprises? The answer depends on the strategic importance of the enterprise. For example, many of the enterprises that are in capital goods sector and heavy industries, government presence may be warranted. It maybe equally necessary for government support in case of international competition as a purely nationalistic guarantee to ensure positive returns on heavy investments.

Secondly, the need for continued government support also arises from the fact that many of the public sector enterprises may in the short run be less equipped to face international competition. A suggestion often put forward that industries where economies of scale operate and there are increasing returns to scale such as the petrochemicals industry, resort to tariff protection (non-distortionary) maybe more realistic than

TABLE 11: STRATEGIC RESPONSE OF SOME PUBLIC SECTOR ENTERPRISES

Enterprise	Current Business	Future Strategies
Bharat Electronics	Electronic-Defence	Image intensifiers - joint venture with Delft Instruments, R and D projects - joint ventures with Ericsson Radio Systems; semiconductors - joint venture with Elcot, SGS Thomson
Hindustan Machine Tools	Machine tools, CNC lathes, tractor, watches	Electronics, telecommunication systems and software; overseas manufacturing unit at Dubai; turnkey overseas projects like railways and mechatronics.
Hindustan Aeronautics	Defence, aeronautics	Sub-contract supply of air-frame and other parts to aerospace industries, manufacture of civil jets and space research
Indian Telephone Industries	Telecommunications	Joint ventures with Equatorial Statcom, for manufacture of earth stations, overseas joint ventures for telephone exchange at Singapore; new products such as satellite rural network with ISRO; research projects with IISC; new telecom products with C-DoT
Bharat Earth Movers	Earthmovers	New products of world-class for export market, setting up of overseas joint ventures for exports.
Steel Authority of India	Steel	Possible diversification to shipping insurance.

purely free trade situation. The possible reversion to infant industry protection may be self-defeating. Instead, a programmed sequencing of privatisation where the PSEs are first privatised in terms of ownership transfer and then allowed to face international competition through tariff reduction could be a preferred option. This is a route implemented in Malaysia and South Korea. In cases of heavy public investments the extent of government ownership pattern assumes significance. What is required is equity participation by the government without the onus of sovereign responsibilities that result in multiple objectives and non-commercial orientation for PSEs.

Finally, the emergent paradigm for the 1990s is clearly oriented towards market functioning under state-supervision. It signifies a departure from the state-controlled and regulated paradigm of the last four decades that prevailed over many economies. The changing dimensions of 'public' and 'private' come into sharper focus and prompts a sequencing pattern more in tune with structural adjustment along the following lines: (a) privatise all manufacturing, trading, and financial sectors; (b) privatise and regulate in infrastructural facilities allowing for both public and private sector units; and (c) reallocate public sector investment to soft infrastructure development strategic sectors, and if necessary, retain them in hard infrastructure for a limited period of time.

IV

Inter-Sectoral Nexus Privatisation and Financial Sector

Interlinkages between the different sectors necessitates a design of sequencing in liberalisation policies very similar to the sequencing of privatisation that we outlined earlier. The interlinkage nexus is most clear with regard to privatisation and the financial sector. Studies¹² have established that a policy of privatisation facilitates financial sector reforms at the later stage. In the initial stage there is no sufficient evidence to prioritise either public sector reforms or financial sector reforms. A heuristic presentation in Table 13 in a nutshell defines the interrelationship. There are three areas of overlap. They are: (i) mobilising resources; (ii) allocating resources; and (iii) corporate governance. The overlap can be both competitive and collaborative. These roles can be better understood for FIs when presented heuristically. Table 13 shows the linkage between privatisation and financial services with special emphasis on FIs.

(i) *Mobilising resources*: Mobilising resources in the privatisation phases can be divided into two dimensions. The first dimension is the mobilisation of resources

TABLE 13: INTER-LINKAGES BETWEEN PRIVATISATION AND FINANCIAL INSTITUTIONS

	Pre-Privatisation Scenario	Privatisation Scenario
Mobilising resources	-Taxes and budgetary support	-FIs (public and private sector)
-to finance enterprises		through public money; new
and later	-funds channelled through	sources of funding
-to privatise enterprises	public sector FIs	-capital markets
-to liquidate enterprises		
Allocating resources	directed priority	-FIs based on their own credit
	-direct and indirect government	evaluation of the enterprise
	subsidies and guarantees	within the constraints of
	-funds through publicly	prudential norms.
	owned FIs	-capital markets
	-credit restrictions on the few	
	private banks	
Corporate governance of	-government or the relevant	-FIs as both shareholders and
enterprises	ministry	providers of loanable funds
		-capital markets

for participating in the equity dilution of public enterprises. The initial rounds of disinvestment of equity were limited only to public sector FIs. The four rounds of disinvestment involved Rs 9,512.78 crore. If all PSEs were to come on to the market, the amount of minimum resources required would be around Rs 50,000 crore which represents the extent of government equity holding in PSEs at the centre. These resources will obviously have to come from the capital markets, FIs and foreign investors. The second aspect of mobilising resources arises from the withdrawal of budgetary support to PSEs while increasing their dependence on internal and extra budgetary sources. PSEs have to look for financial resources from the FIs, capital markets and foreign investment. These are resources both for operating capital and new investment.

The issue is where do FIs find the funds? Domestically they can tap the capital market, tap the retail market or borrow from the money market. At present, the main source of domestic resources are household savings. The RBI estimates show that 26 per cent of household savings go to the corporate sector through the capital markets, while household savings has reached a plateau. Draft on the household savings by FIs is limited and requires new innovative schemes to attract investment. All these add to the cost of funds mobilised. Furthermore, the FIs have to compete with schemes of the corporate sector including public sector bonds. The alternative option open is to tap the international market through the bond route or the equity route. Here again there is competition from the corporate sector. As a result both FIs and the PSEs will be competing for the same source of funds. Mobilising resources is a major task for FIs who are now experimenting with new instruments which are largely derivatives. This adds to the risk of FIs.

(ii) *Allocating resources*: In a privatising economy resource allocation to enterprise becomes a difficult task. Firstly, rapid industrial growth requires the easy and quick availability of credit at low rates of interest. FIs used to operating under conditions of diktat have now to arrive at their own criteria of creditworthiness in allocating funds to enterprises. The major problem for FIs is however in the provision of funds to the non-tradable sector, viz, the infrastructure sector, where the demand will be mainly from the new entrants of the private sector. To get an idea of the dimensions involved CMIE estimated on the basis of proposed investments (both in the pipeline and those announced) that in the infrastructure leaving out telecommunications investment works out to Rs 4,40,617 crore. If we add another Rs 90,000 crore which represents the amount that would be normally forthcoming from public sector investment in these areas, the

amounts involved are very large. At present the total disbursements of FIs is in the range of Rs 25,000 crore.

There are two issues here. The first issue which overlaps with the earlier section is where to find the funds? The second issue for FIs is how to match their loan portfolio with the provisions of the new prudential norms. A major concern in the case of infrastructure lending is the mismatch between borrowing short and lending long. FIs have to show innovativeness such as loan syndication, develop new instruments such as special vehicles of credit, tap new sources such as postal savings.

(iii) *Corporate governance*: Monitoring managers becomes very important for FIs. In the earlier regime of directed credit with access to cheap sources of funds monitoring was based on different criteria. In the case of PSE accountability of managers was accountability to CAG without clearly defined commercial objectives. In a privatised scenario FIs have to monitor the performance of managers both from the viewpoint of a lender and from the viewpoint of shareholder. And, there is a difference between the two perceptions. Till of now the first role was non-existent while the second role through the nominee directors was purely ornamental.

The issues here are: Are the FIs geared to their new role? What is expected of them as a lender? Are they to look for merely repayment of loans? In which case new investment such in R and D, or the problems associated with sunk costs in the case of infrastructure expansion may not be appreciated. What is expected from FIs as a major shareholder? Here the incentive system works from the perspective of an owner and not that of a manager.

The new illustrations of the nexus between privatisation and financial sector are only to underscore the need for a policy on privatisation, in whatever form. Successful privatisation in the UK, New Zealand and elsewhere have shown that an important component of privatisation is the scope for mobilising resources for equity and also of servicing the debt of enterprises. Sequencing of privatisation and prioritising industries aids in preparing a time frame for FIs. Their experience underlines the need for a comprehensive policy on privatisation.

A non-policy on privatisation as it prevails now in India has its impact on the economy. Lack of policy might favour the considerations of political expediency in the short run but at the cost of sacrificing sound economic management in the long run. This proposition has broadly been vindicated by our enquiry on three aspects of privatisation including fiscal, efficiency and intersectoral nexus. Of course, the impact of privatisation in these three areas has varied. From all the

three angles the lack of a comprehensive policy on privatisation defuses the scope for realising the potential gains of privatisation. For instance, as a fiscal measure privatisation through disinvestment has had a marginal impact on the budget without generating the required efficiency forces of ownership transfer on the functioning of PSEs. The present policy of covert privatisation through gradual dilution of equity leaves the present PSE management with less teeth than merited by competitive conditions. In order to use the weapon of privatisation for efficiency it is necessary to plan the areas open to competition and those that have traces of natural monopoly where government control may still be required. Such planning is part of a policy on privatisation. Finally, the present status of financial sector reforms suggests that a policy of privatisation may smoothen the process of reforms. In essence, a comprehensive policy on privatisation requires to be formulated towards the full realisation of the potential of economic reforms.

Notes

[This paper is a modified version of the paper presented at the international conference on India's new economic policy on 'Economic Liberalisation and Economic Development' held at New Delhi, March 11-14, 1996. I would like to thank Y Venugopal Reddy and T L Sankar for their comments on the paper. However, I remain responsible for all commissions and omissions.]

- 1 This broader definition of privatisation was first popularised in the APDC study *Privatisation and Public Enterprise: The Asia-Pacific Experience*, Geeta Gouri (ed), Oxford and IBH, New Delhi, 1991.
- 2 See these with reference to Plan Documents, New Industrial Policy etc.
- 3 In fact, the lack of a policy on privatisation has been regarded as one of the determinants of the incomplete agenda of liberalisation. See A Chopra, C Collyns, R Hemming, K Parker, W Chu, and O Pratzscher, *India Economic Reform and Growth*, IMF, Occasional Paper 134, Washington, 1995.
- 4 The exceptions to market discipline are where there are market failures. In the literature on public sector and public ownership they relate specifically to public goods and natural monopolies.
- 5 Classification and categorisation is as per the coverage of the Public Enterprise Survey; department of public enterprise, ministry of industries, government of India. The normal practice is to consider PSEs non-departmental under the central government to be those listed by the department of public enterprises in their annual survey. The survey has a separate section on financial institutions (excluding public sector commercial banks) but this category does not form part of the main section in the survey.

6 Op cit.

7 Ahluwalia has estimated that the public sector take up 55 per cent of total investment but account for only 15 per cent of output. [Ahluwalia, *New Economic Policies: Reform of Public Sector Enterprises and Privatisation in India*, mimeo paper, Centre for Policy Research, New Delhi, 1994]

8 Sunita Raju and C V Baxi, 'Efficiency Through Competition: Evidence from Public Sector Reforms in India', (memo paper).

9 Government of India, *Economic Survey*,

10 This has lead to the demand for privatisation of the private sector.

11 The Statement of Industrial Policy 1991 was the first basic document that outlined the strategy for PSEs. The following dimensions were enumerated in the policy. (1) restructuring the portfolio of investments; (2) restructuring the equity (ownership) pattern of PSEs; (3) restructuring the quality of interface between the government and the PSEs, (4) restructuring the boards; (5) restructuring the sick enterprises; (6) restructuring the safety net; and (7) restructuring the policy environment.

12 These six industries are defence products, atomic-energy, coal and lignite, mineral oils, railway transport, minerals specified in the schedule to the Atomic Energy Order 1953.

13 The central corporations are the Nuclear Thermal Power Corporation, Nuclear Fuel Corporation, North-East Power Generating Corporation, National Transmission Corporation and of course the grids.

14 The common minimum programme (CMP) of the present government talks in terms of retaining public sector in core and strategic areas, without defining either core or strategy. Presumably PSE that do not fall into this category will be privatised. The modality of privatisation will be worked out by a special committee on disinvestment set up by the government.

16 Budget Papers, Government of India.

17 A Chopra, C Collins, R Henning, K Parker, W Chu and O Fratzscher, *India: Economic Reform and Growth*, IMF, Occasional Paper 134, Washington, 1995.

18 One estimate places the revenue lost due to under valuation as Rs 8,917 crore in 1991-92, Rs 805 crore in 1992-93 and Rs 91 crore in 1993-94. A back of the envelope calculation shows that equity in PSEs in 1993-94 was about Rs 23,006 crore. If 20 per cent were sold at par value disinvestment accruals will be Rs 46,000 crore. Another important issue that has not been given much prominence is the ability of the market to absorb even 50 per cent of disinvestment of PSE and when combined with requirements of the public sector (i.e., both PSEs and PSUs including FIs) the figures are enormous. Swati Karnal, 'The Politics of Disinvestment', *The Economic Times*, December 8-14, 1995.

Automotive Industry in Emerging Economies

A Comparison of South Korea, Brazil, China and India

Avinandan Mukherjee
Trilochan Sastry

The automotive industry in South Korea, Brazil, China and India is currently going through impressive growth. Governments have played a key role in the evolution of the industry in all these countries. South Korea, a relatively late entrant to the automobile industry, has made the most significant progress, and is now exporting cars to developed markets. It is the only country that invested in R and D for product development, retained management control in joint ventures with multinational companies (MNCs), and had ambitious export targets. The industry in Brazil is older than that in South Korea, but indigenous product development capabilities are lacking and manufacturing competitiveness is limited even though the industry is entirely controlled by MNCs. The Indian industry is experiencing a revolution with rapid growth and the entry of the largest number of MNCs. The Chinese industry is also growing very rapidly although it is still highly fragmented. We trace the evolution of the industry in these growing markets and explore the linkages between government policy, the degree of managerial control and indigenous capabilities and competitiveness.

SOUTH KOREA, Brazil, China and India on the one hand, and Thailand, Mexico, Malaysia, and Indonesia on the other hand are all late-industrialising nations. But, as Amsden and Kang (1995) argue, there is a basic difference between the two groups with regard to the current and future status of their automobile industries. The second group of late industrialising countries, comprising Thailand, Mexico, Malaysia and Indonesia have built an indigenous automobile industry to restrict outflow of precious foreign exchange and to meet local demand. These countries do not intend to become major players in the global automobile industry in the near future. On the other hand, the first group of late-industrialising countries, namely, South Korea, Brazil, China and India are building significant manufacturing capabilities and have the potential to become significant players in the world automobile industry. South Korea has already become a significant exporter. The sheer size and market potential of China and India and impressive rates of economic growth suggest that they could emerge as significant players in world markets. Amsden and Kang (1995) call this group of countries "emerging economies or manufacturers" and not just "emerging markets."

The evolution and current state of the automobile industry in these emerging economies are not identical. The objective of this paper is to do a comparative analysis of the automobile industries in these four countries and identify some factors that seem to lead to better performance.

There are some major differences between these countries and the developed nations. First, industry evolution has been influenced considerably by government policies and regulations in all these countries. However, this may not necessarily impede

growth and development since these governments sometimes play a supportive role that helps build long-term capabilities. Second, infrastructure in roads tends to be poor. This has implications for the long-term growth of the industry. The level of technology and manufacturing capability tends to be highly varying with very few world class plants and many others at a fairly mediocre level. The supplier industry is also not well developed, and product development capabilities tend to be poor except perhaps in the case of South Korea. These markets are also much more price sensitive than developed markets. This is perhaps because the ratio of car prices to incomes is much higher in emerging markets. On the positive side, assembly costs in these countries are lower by at least 30 per cent [O'Brien and Karmokalias 1994], although this does not give any significant advantage since assembly costs are a small proportion of total costs.

The economic performance in 1994 of the automobile industries of South Korea, Brazil, China and India, based on a few important dimensions, is given in Table 1. The data include sales of all vehicles (include those other than passenger cars).

These four countries together accounted for about 7.7 per cent of world sales in 1994. As is clear from the table, India and China offer huge untapped markets and their growth rates are also impressive. However, the volume of trade with the rest of the world is very low. South Korea and Brazil on the other hand have significant exports, but few imports. There are likely to be opportunities for foreign companies since these emerging markets cannot develop without help from outside. In China, the share of passenger cars in total vehicle sales is very low at 15 per cent.

INDUSTRY EVOLUTION

The evolution of the automobile industry in these countries has some interesting differences. Amsden and Kang (1995) trace significant developments in the South Korean industry. The South Korean automobile industry started production in the early 1960s and initially gained experience through CKD manufacture, and started mass production with a single model (the Pony). Three large diversified South Korean companies emerged in the automobile market - Daewoo, Hyundai and Kia. These companies gained knowledge and experience through joint ventures with MNCs, although they never surrendered management control. Later they developed their own models for the world market. Government policies clearly encouraged exports, and by 1993 they were exporting 38 per cent of their production. Industry evolution has been driven by the need to grow and export by passing through the stages of CKD manufacture, foreign collaboration with South Korean managerial control, mass production and export of a limited number of models, gradual adoption of lean production and finally, acquiring product design capabilities to try and become truly international.

The Indian automobile industry was governed by regulations since the country became independent in 1947. Imports, collaborations and equity ventures were severely restricted by the government. Capacity expansion was restricted and required licences issued by the government, and technology transfer from foreign companies was subject to government approval. In 1981, the government decided to set up Maruti Udyog in collaboration with Suzuki Motor Company of Japan, the first MNC to enter the country. Maruti started

mass production by introducing a "people's" car in the economy segment. This led to a boom in demand for automobiles in India. With a current capacity of about 2,50,000 vehicles, Maruti is the clear market leader with about 70 per cent market share in 1995.

Market liberalisation in 1991 and a change in policy allowed free entry to foreign companies. MNCs have not chosen to enter on their own and have entered into joint ventures with Indian partners. Unlike the South Korean industry which grew from CKD manufacture to a significant exporter of cars, the Indian automobile industry's growth seems to be currently led by immediately available opportunities in the domestic market. Several large assemblers have entered the Indian market through joint ventures. Unlike South Korea, managerial control is with international companies. As of date, no Indian company has plans to become a significant global player except perhaps Telco which is about to launch indigenously designed vehicles in international markets. The component industry however, has a long way to go to meet the challenge. Therefore, the assemblers are initially importing knocked-down kits, and are slowly indigenising. Several assemblers are encouraging their own overseas component suppliers to enter India through joint ventures with local supplier firms. One can characterise the industry evolution as a movement from strict government regulations to an industry driven by growth prospects, foreign managerial control, minimal government interference except for duties and taxes, and no major thrust towards becoming truly global or acquiring capabilities in product development. However, it may emerge as a significant exporter since domestic market may not be able to sustain 18 companies in the country.

The development of the Brazilian automotive industry has been described by Ferro (1995). The industry initially started off with the objective of import substitution in the 1950s. However, unlike Indian government policy at that time, foreign companies were allowed to enter with full management control, and Volkswagen, General Motors and Ford were major companies in Brazil for a long time. However, isolation from world trade hampered industry development. Much later, in 1990, the government opened up the market to imports. Current growth has been led by the 'popular' car in the economy segment. The Brazilian industry has also not invested significantly in product development. Efforts are on to adopt lean manufacturing practices, although the supplier industry continues to be a major bottleneck. Government policy on duties and taxes has been vacillating leading to cyclical demand over the years. The evolution of the Brazilian industry has been a transition

from import substitution to integration with world markets, fluctuating duties and taxes, government led price reductions, thrust towards adoption of lean production and growth led by the 'popular' or small car segment. No indigenous Brazilian automotive company has emerged so far and there is no thrust towards acquiring product development capabilities.

The evolution of the industry in China has been described in detail by Yang (1994). The Chinese automobile industry had a different evolution. The industry has always

been highly fragmented and in 1979 there were 130 assemblers who made 1,86,000 vehicles, with most of them making only hundreds of vehicles. By 1993 there was some consolidation into "combined management companies" and there were 40 assemblers producing about 5,00,000 vehicles. Further, unlike South Korea, Brazil and India, passenger car production has been a very small percentage of total production, and was 15 per cent in 1994. Autonomy provided to provincial governments led to dispersed development by foreign collaborations. The

TABLE 1: ECONOMIC PERFORMANCE OF AUTOMOBILE INDUSTRY, 1994

Dimensions	South Korea	Brazil	China	India
(1) Share of world vehicle sales volume (per cent) (1994)	2.5	2.2	2.0	1.0
(2) Growth in share of world vehicle sales volume (1991-95)	8.7	12.4	42.86	42.86
(3) Production (million units)	1.5	0.96	0.51	0.34
(4) New registrations (million units)	1.05	0.77	0.62	0.34
(5) Share of output exported (per cent)	25	20	0	5.0
(6) Share of inputs imported (per cent)	<1	0	6.0	<1.0
(7) Share (per cent) of passenger car in total vehicle sales	68	75	15	60
(8) Persons per car	12.4	11.4	245	200

TABLE 2: KEY ELEMENTS OF GOVERNMENT POLICY

	South Korea	Brazil	China	India
Local content requirements	Not an issue	High	High	None*
Import duty (per cent)				
Full vehicles	25	70	50	110
CKD/SKD		30	30	50
Parts/components	15	20	25	50
Excise duty (per cent)	10-25	20-35	High	40
State ownership	Absent	Absent	High	Low

Note: * Capacity expansions require government licences and may depend on the level of indigenisation.

TABLE 3: COMPARISON OF CAR ASSEMBLY INDUSTRY

Country	No of Assemblers	Growth in No of Assemblers (Per Cent) (1985-1995)	Output Share of Top 3 Firms (Per Cent)	Growth in Output Share of Top 3 Firms (Per Cent) (1985-1995)	MNCs Present
Korea	6	100	95	-5	Mazda, Mitsubishi, GM, Ford, Honda, Mercedes
Brazil	5	28	95	15.8	GM, Ford, VW, Fiat,
China	18	38.5	48	4.3	GM, VW, Chrysler, Peugeot
India	5	100	88	17.33	Suzuki, Peugeot, GM, Ford, Fiat, Daewoo, Mercedes, Rover, VW*

Note: * Hyundai, Mitsubishi, BMW have announced plans to enter in the years 1996-98. Audi plans to sell cars without local manufacture.

TABLE 4: AUTO COMPONENTS INDUSTRY

	South Korea	Brazil	China	India
No of firms	1100	550	250-300	350
Turnover (\$bn)	12	15	5	2.6
OEM:RM Split	80:20	50:50	50:50	20:80
Overseas collaborations	Many licensing agreements	20 per cent of firms are foreign affiliates	60 per cent of firms have Japanese links	38 per cent of firms have foreign tie ups
Exports	10 per cent of sales	15-20 per cent of sales	20 per cent of sales	10 per cent of sales

strategy was to obtain foreign capital and technology, and they were forced to give managerial control to international partners. Of late the government has been trying to push a "people's car" in the economy segment. This is similar to what happened in Brazil and India where the small car led industry growth. The industry is in the process of developing its supplier base, and probably has some way to go before it acquires product development skills. It is also probable that unlike Brazil and Korea, there will be no major thrust toward adopting lean production in the near future.

Industry evolution has therefore been led by government policy, notably the degree of autonomy given to provincial governments, attempts to consolidate a highly fragmented industry, acquisition of foreign capital and technology, relatively weak Chinese managerial control in joint ventures, and a thrust towards growth and development. Impressive economic growth and a large population with a very low number of cars per thousand people suggest that demand is likely to grow significantly.

GOVERNMENT POLICIES

The Indian government has made significant shifts in its automobile policy. Ever since independence, the government considered the passenger car as a luxury item, and imposed very high tariffs. After the economic liberalisation launched in 1991, the government of India announced a new automobile policy in June 1993. Excise duties varied over the years as follows:

Year	Excise Duty (Per Cent)
1984-85	15
1990-91	42
1991-92	66
1992-93	56
1993-94	40

The import duty on car components was increased from 40 per cent to 75 per cent during 1984-91 and brought down to 50 per cent recently. Thus duties and taxes continue to be high by international standards. These might be brought down as the industry becomes more competitive.

The Brazilian government's role has also undergone changes in the recent past. Previously, the focus of government policy was on import substitution, as is typical of most developing countries. The government is now trying to improve the global competitiveness of the Brazilian automobile industry by opening it up to imports. At the same time, the government is also introducing supportive measures to rejuvenate the domestic industry. Some of these measures are: new institutional arrangements involving

the entire supply chain including the importers, unions and government agencies, tax reductions, and pushing the 'popular' or small car by differential taxes. Import duties have varied a lot in the last five years as shown below:

Year	Import Duty (Per Cent)
1990	85
1991	60
1992	50
1993	40
1994	35
Feb 1995	20
April 1995	70

Some stability in policy is probably needed for faster development of the industry.

The influence of the Chinese government in shaping the country's automobile industry has been significant. China's progress from the command to the market economy, and the autonomy given to provincial governments has helped in growth. The government also succeeded to some extent in consolidating a highly fragmented industry. The Chinese government now identifies the auto industry as one of China's 'developmental pillars' and has been trying to attract foreign investment to improve technology. It has even accepted its role as a minority

partner in some ventures. The government is also encouraging the "people's" car. Although managerial control is with foreign companies, they are obliged to raise the domestic content of car subassemblies. Unlike its Indian counterpart, the Chinese government has linked import duties to the level of indigenisation achieved. The government has also played an active role in restructuring manufacturer-supplier relations.

The role of the South Korean government has perhaps been the most positive among all the four countries. This is because the South Korean government has always supported as well as disciplined South Korean industry through export targets and incentives and through price controls. Overseas investments were encouraged by subsidised credit, and technology infrastructure improved through imports. The industry also enjoys trade protection. It is interesting to note that price controls seem to have had a positive impact in South Korea, forcing companies to improve productivity and efficiency by cutting costs. However, in Brazil, these controls were perhaps counter-productive. This may be due to high rates of inflation, leading to severe pressures on profit margins and adversely affecting assembler-supplier relations. It is also likely to have had an adverse impact on growth.

TABLE 5: SUMMARY OF COMPARISON OF FOUR COUNTRIES

	South Korea	Brazil	China	India
Evolution	CKD-mass production of one model, exports, building skills in product development	Import substitution, growth and entry of 4 MNCs, foreign managerial control	Highly fragmented industry, consolidation, joint ventures with MNC control, growth	Government regulations, growth, entry of 13 MNCs, foreign managerial control, deregulation
Major products	Mid Size	Small Car	Small Car	Small Car
New product development	Capability exists although suppliers are lagging behind	Indigenous capability lacking	Indigenous capability low	Except Telco, capability lacking
Managerial control	With Korean companies	With MNCs	With MNCs	Usually with MNCs
Lean production	Gradually adopting it	Thrust towards lean production	Marginal	Marginal
Goal of technology strategy	To become world class and global. Investing heavily in R and D	To facilitate growth and efficiency. Low investment in R and D	To meet domestic needs. A catch up strategy	To facilitate growth. Low investment in R and D
Suppliers	Moving towards world class status. Some are able to design proprietary parts	Getting restructured for lean production. Acquiring design capabilities	Growing rapidly through joint ventures	Growing rapidly through joint ventures
Government role	To help investments abroad, and to upgrade technology infrastructure. Disciplining and supporting industry	Fluctuating tariffs, price controls, heavy taxes except for low priced 'popular' cars	Acquiring technology and managerial expertise through joint ventures	Largely restricted duties and excise. No clear policy as yet.

Another factor might have been that unlike South Korea, there was no drive to acquire, absorb and develop technology and products, which in turn was driven by the need to export. Price controls thus worked well in an industry with higher levels of capability, whereas they were counter-productive in an industry at an earlier stage of evolution.

State participation in assembly units is high in China. The joint ventures with Peugeot, VW, Chrysler, and GM have state participation in equity. India's largest assembler, Maruti, is a 50-50 venture between the government and Suzuki. However government participation is absent in all other companies. State participation in equity is completely absent in South Korea and Brazil. Table 2 summarises some of the key elements of government policy.

The car assembly industry of the four countries has been compared in Table 3, based on the number of firms, level of concentration, and the major MNCs present in the country.

The auto component industry of these countries differs in the number and size distribution of component firms, and other characteristics, like turnover, OEM/RM split, equity, and export performance (Table 4).

One of the reasons for the success of the South Korean automobile industry is the closely knit assembler-supplier structure. The automobile assembler companies belong to large chaebols (conglomerates). Thus, they have affiliate firms within the conglomerate supplying them with parts, machinery, software or information, and even financing. Suppliers have invested heavily in learning both from assemblers and from foreign supplier companies, and have become more capital-intensive and specialised. The result is improved performance, and ability to design some proprietary parts. This has helped assemblers to enter world markets. Such close assembler-supplier relations within the same business group or conglomerate is not present in India, Brazil or China. The industry size in India and China is much smaller than in South Korea and Brazil, although growth rates are much higher.

EXTENT OF ADOPTION OF LEAN PRODUCTION

The extent to which these emerging economies have adopted lean production varies. South Korean companies argue that lean production can be successful only when there are large volumes. Since the South Korean companies have relatively low volumes, they have not adopted lean production. JIT is not practised because of the very low volumes that would be transported, the poor quality of part suppliers and the instability of the process due to rapid introduction of new models and rapid growth.

Other elements of lean manufacturing like developing multi-skilled workers and allowing workers to stop the assembly line are not practised perhaps because of the current emphasis on growth in volume and exports. However, they are aware of the benefits of lean production, and consider lean production as a goal to be achieved in the near future.

The experiment with adoption of lean production in Brazil seems to have borne fruit [Ferro 1993]. In spite of cultural factors like high power distance and an authoritarian social structure which inhibit the diffusion of lean production, the Brazilian industry has been able to make use of the motivated and trained workforce to push acceptance of lean manufacturing approaches, like teamwork, training, participation, involvement and commitment of workforce, increased communication and decentralisation, emphasis on problem-solving activities, reduction of quality inspectors, and flatter structures by cutting managerial and supervisory layers. The results are reduced inventory and lead time, reduced defects and increased productivity.

Since the Indian industry achieved significant production volumes only in the mid-1980s with the arrival of Maruti, the transition to lean production is likely to take time. However, with many automobile makers entering the growing Indian market, lean production is likely to be adopted. The success of lean production at the industry level depends not only on the efforts of the assemblers, but also on the suppliers and on institutional and cultural factors. A very important obstacle in adopting lean production is that a large proportion of components are imported in the form of CKD/SKD kits by the new entrants. Distances of suppliers from assemblers are frequently high. The bargaining power of suppliers for some components is high, because of their small number. They accept only large orders. It is likely that after the shake out which many analysts expect, adoption of lean production will take off more rapidly.

There is not much information available about the diffusion of lean manufacturing practices in China. However, given the diffused nature of the industry and the low volumes generated, it is expected that the Chinese industry has a long way to go before it can adopt lean manufacturing as an industry paradigm.

IMPLICATIONS AND CONCLUSIONS

Table 5 summarises the comparison between these countries. The South Korean industry, a later entrant than Brazil, has progressed much further. Government support, a clear vision of becoming an export-

oriented world class industry, retaining management control, investing in R and D, and acquiring product development capabilities have helped it to grow and develop fast. The other three countries have not invested in capability building to the same extent. Brazilian plants are simply overseas plants of MNCs. Indian plants are joint ventures with MNC control. It is unlikely that significant R&D will be done there. In Brazil, China and India, industry growth is led by the small car segment. Lean production has not been adopted in a significant way, except perhaps in Brazil. The relatively poor development of the supplier industry is still acting as a deterrent to rapid growth.

Uncertainty exists about the extent of growth, the degree to which suppliers can meet demand, and the prospects for an individual company. MNCs have followed the practice of introducing successful models to these markets. It remains to be seen whether this strategy will succeed. South Korea is a market for overseas MNCs, but is emerging as a trade partner rather than a major net importer of cars. However, opportunities exist for overseas supplier companies in South Korea. With stagnation in developed markets and huge additions of capacity in emerging markets, the monopoly of developed nations over car production could erode, although they will continue to dominate product development.

Small-Scale Chemical Industry in Gujarat

Structure, Conduct and Performance

G S Gupta
A K A Rath

This is an empirical study based on the primary data from a sample of 208 small-scale chemical units in Gujarat for the years 1986 through 1990. The details on the various dimensions of the structure, conduct and performance are presented and the nexus among them is examined. The findings suggest no unique relationship among structure, conduct and performance. However, each of middle age, partnership form of organisation and location in Baroda/Ahmedabad districts has, in general, proved a beneficial structural feature from the point of view of performance.

I Rationale

A STUDY of the small-scale chemical industry in Gujarat has been attempted, for the growth of the Indian economy hinges significantly on the growth of its industrial sector, of which chemical industry happens to be a major component, Gujarat enjoys the number one position with regard to chemical industry in India, and the small-scale industrial sector is encouraged to generate employment and to combat inequalities. A quick look at the data would indicate that the small-scale sector is a significant component of India's industrial sector. According to the second census of modern small industrial units (1987-88), there were 9.87 lakh units in the census frame, and the data from 5.82 lakh of these units account for 36.7 lakh employees, Rs 9,296 crore of fixed capital and Rs 43,220 crore of output (at current prices) [1]. Gujarat with about 6 per cent of these units occupies the fifth position, the first four being Uttar Pradesh, Madhya Pradesh, West Bengal and Andhra Pradesh, respectively.

Chemical industry enjoys the highest weightage of 12.51 per cent in the country's index of industrial production. Further, this industry sector has grown at the annual rate of 8.8 per cent during 1980-81 through 1992-93, which happens to be the second highest (next to that of electrical machinery industry) among all industries and is much above the average industrial growth of 6.4 per cent during the corresponding period. An analysis of chemical industry versus all industries in India indicates that in 1988-89 its share in all industries stood at 6.7 per cent in terms of number of factories, 7.3 per cent in employment, 10.4 per cent in fixed capital investment, and 13 per cent in terms of gross output. Gujarat enjoyed the top position among all states with regard to chemical industry with a share of 16.8 per cent in terms of number of factories, 18.9 per cent in employment, 28.8 per cent in fixed capital investment, and 24.5 per cent in terms of gross output during 1992-93 [2]. These shares

are generally more than twice of Gujarat's share in all industries in India, which stood at 10.7 per cent in terms of number of factories, 8.5 per cent in employment, 9.6 per cent in invested capital, and 10.9 per cent in terms of gross output in 1988-89 [3].

The second all-India survey of small-scale industry, included data from Gujarat for 2,868 chemical units, having 30,612 employees, Rs 159 crore of fixed capital investment and Rs 747 crore worth of gross output at current prices, with corresponding all-India figures of 25,941 units, 3.14 lakh employees, Rs 881 crore of fixed capital investment and Rs 5,273 crore worth of gross output [1].

II Approach

No systematic data are published on the small chemical industry at the micro (firm) level. Thus, for the purpose of this study, a survey of the small chemical units in Gujarat state was conducted. A detailed questionnaire was designed for the purpose, which was first administered personally to five units to ensure its effectiveness. Subsequently in 1991, the questionnaire was mailed to randomly selected 1,000 units covering various chemical products. With vigorous follow-up, the filled-in questionnaires were received from 223 units. On editing, some missing/incompatible data were discovered, which were sorted out through personal visits and rejection of a few units from the sample. The final sample thus consists of 208 small chemical units in Gujarat, and the data so collected covered a period of five years, viz, 1986 to 1990. These units constitute 7.3 per cent of all the small chemical units in Gujarat. Incidentally, it may be noted that while all the units under the sample belonged to the small-scale industrial sector at the time of establishment, five of them had crossed over to the medium sector by the time of this survey.

In what follows, the simple averages (mean values) of the corresponding five years, data are considered for the variables in question

(the minimum and maximum values for all the variables were obtained but those for only sub-groups I and II are included in the tables, for not complicating the reading) and the compound (exponential) annual rate of increase in a particular variable during the five years is taken as the growth rate. Due allowance for the future must be made for the magnitude of a variable if its current magnitude is to be assessed, but not much change is expected so far as the growth rates and the ratio variables are concerned. The industry's structure, conduct and performance are analysed using the framework developed by Bain [4].

III Industry Structure

The data pertaining to the structure of the small-scale chemical industry in Gujarat by product groups and the distribution of firms by structural variables are presented in Tables 1A, 1B and 1C. It is observed that about 20 per cent of all the firms are engaged in each of the production of dyes, and dyes and pigments intermediates. Roughly 12 per cent of them produce inorganic chemical (sodium silicate, sodium bisulphite, metal oxides/ chlorides/ sulphates, etc) and about the same proportion of firms manufacture organic chemicals (chloral, nitro-chlorobenzene, benzoic acid, etc). The other important products, in the descending order in terms of the number of firms are resins and allied products (8 per cent), pigments (8 per cent), drug intermediates (5 per cent), solvents and plasticisers (4 per cent), drugs (3 per cent), medical products (adhesive tapes, surgical handgloves, diagnostic reagents, etc) (2 per cent) and other miscellaneous products (6 per cent). Incidentally, note that while firms had multi-products, each of them were in only one product group. Thus, while a firm might have produced more than one kind of dyes but then it did not produce any non-dyes product. A majority of the firms (56 per cent) are organised on the partnership form, the rest are private limited companies (28

per cent) and proprietorship-based (16 per cent) firms. This trend is almost universal across various products, barring dyes, pigments, inorganic chemicals, and resins and allied products, where proprietorship is more popular than private form. About 40 per cent of the units are located in Valsad district, Ahmedabad and Bharuch each have roughly 13 per cent of the units, Baroda has 10 per cent, Kheda and Mehsana each have 9 per cent. Thus, most of these units are found on Valsad-Mehsana belt. Some exceptions to this rule are the pigments units, which are heavily concentrated in Ahmedabad, and inorganic chemicals units, which are found maximum in Mehsana.

Small chemical industry in Gujarat is dominated (36 per cent) by non-graduate promoters (owners/directors). The second and third positions are taken by science (25 per cent) and other (19 per cent) graduates, respectively. This was followed by engineering degree or diploma (15 per cent). Thus, the educational and professional background does not merit much in the promotion of chemical units. There is hardly any variation to this rule across products. An overwhelmingly large proportion (41 per cent) of firms borrowed (stole) the technology from other firms, about 26 per cent got it through hiring experienced persons, 22 per cent developed it in-house, and 9 per cent and 2 per cent sourced this through self-experience and buying indigenously, respectively. Exceptions to this trend are found in products like organic chemicals, drug intermediates, and solvents and plasticisers, where the technology was sourced more through hiring experienced persons than any other source. Also, in case of medical products, the main source happened to be through 'self-experience'.

Over 50 per cent of the firms used light diesel oil for their fuel requirement. Other fuel sources, viz, coal, furnace oil, wood, diesel (high speed) oil, etc, were more or less equally used by the remaining firms. The major deviation to this trend was in products like inorganic chemicals, where wood was the most important fuel source, and resins, where other fuel sources (viz, LPG, kerosene, naphtha, electricity, etc) had the dominant role. As regards the mode of sales is concerned, roughly two-thirds of the firms sold directly to the customers, 15 per cent through agents, 13 per cent through brokers, dealers and traders, and the rest through sole selling agents. There were no discerning deviations to this phenomenon across products.

Moving from the structural variables based on the number of firms (Tables 1A, 1B and 1C) to the ones based on the magnitudes of the relevant variables (Tables 2A and 2B), one finds that the average age of a firm in this industry stands at 9.6 years. It is the least

(6.1 years) for firms producing solvents and plasticisers, and the most (24.2 years) for those engaged in the production of medical products. The number of promoters for a firm averaged at 3.8 persons, with a range of 3.0 persons each in solvents and resins, and 5.4 persons in drugs. The promoters spent practically all their days (25.9 days/month) in looking after their units, and this was almost uniform across products. These units required 15.7 cubic metres of water per day on average, but this requirement was the least (5 cubic metres) for medical products and the most (25.7 cubic metres) for inorganic chemicals. On an average, a firm had 73.1 kilo watt of connected power. Self-generating capacity of the firms, on an average, was 11.1 per cent of the connected power. The connected power varied significantly across the products, with the minimum of 42.5 kilo watt in pigments and the maximum of 131.9 kw in drugs. The proportion of self-generated power was the least (0.5 per cent) in resins and the most (30.7 per cent) in drugs. Most of the firms had insurance policies and on an average a firm spent Rs 19,200 by way of annual insurance premium. This premium was the least (Rs 6,200) in pigments and the most (Rs 33,300) in medical products.

The annual turnover (sales) of an average firm in the industry stands at Rs 121 lakh, with the minimum of Rs 57 lakh in dyes and the maximum of Rs 356.7 lakh in drugs. The total invested capital was Rs 41 lakh for an average firm, with the least of Rs 22 lakh in dyes and the most of Rs 80 lakh in drugs. The corresponding figures for investments in fixed capital, and in plant and machinery for an average firm stand at Rs 20 lakh and Rs 14 lakh, respectively. An average firm employed 23 persons, of which 17 were workers and out of them 5.8 were skilled workers. Thus, a firm employed six officers/supervisors/staff and 11.2 unskilled workers.

The employees were maximum (51.4) in medical products and minimum (11.2) in solvents and plasticisers. The proportion of various categories of employees varied across products. Skilled persons were relatively few (11 per cent) in pigments and about the same (15-20 per cent) elsewhere. It will be interesting to note that the average turnover (Rs 121 lakh) and employment (23 persons) per unit in the sample firms are quite large compared to the corresponding figures for all SSI units in the country, which stand at Rs 11.4 lakh and 5.7 persons respectively [5].

The above structural analysis suggests that the small chemical industry in Gujarat is dominated by dyes and dyes/pigment intermediates, partnership form of organisation, Valsad district location, non-graduate promoters, technology sourced through other competing firms, light diesel oil as the source of fuel and sales direct to the consumers. Further, an average firm has existed for 9.6 years, has 3.8 promoters working almost full-time, requires 15.7 cubic metres water per day, 73.1 kilo watt of power connection, Rs 40.5 lakh of total capital investment, and 23 employees, and generates an annual turnover of Rs 121 lakh. Among various products, manufacturing of drugs is the most capital-intensive, most skill-intensive, and most productive in terms of sales proceeds. The other extreme in these regards goes, in general, to dyes, though with regard to skilled manpower, pigments' need is the minimal.

IV Industry Conduct

Industry conduct is normally analysed through pricing strategy, product strategy, technology, research and development, advertising, etc. However, in the small-scale sector, some of these factors are either not

TABLE 1A: INDUSTRY STRUCTURE - I

All	208	32	117	59	28	21	28	80	18	18	15

of much significance or are of a confidential nature. In view of this, the analysis is restricted to factor proportions (technology) by products only, whose data are provided in Table 3.

An average small-scale chemical unit in Gujarat had fixed (equipment and structure) and working (inventories, cash and net debtors) capital in the proportion of 57:43, and equipment (plant and machinery) and structures (land, buildings, furniture, fixtures) in the ratio of 67:33. The former ratios varied significantly across products (minimum of 43:57 in resins and maximum of 70:30 in drug intermediates) while the latter relatively in a narrower range (lowest of 62:38 in inorganic chemicals and highest of 76:24 in medical products). This is expected, for different products' need varying proportion of working capital while the share of plant and machinery in total fixed capital is about the same across products.

A review of the capital-labour ratios across products indicate that organic chemicals, and solvents and plasticisers are the most capital-intensive products while medical products and pigments, in general, are the least capital-intensive ones. In terms of fixed capital alone, while organic chemicals and drug intermediates are the most capital-intensive, medical products and drugs are the most labour-intensive products. With respect to investment in plant and machinery only, drug intermediates is the most capital-intensive, and medical products and pigments are more labour-intensive ones. Thus, if employment generation is the objective, one needs to encourage firms engaged in the production of pigments and medical products. In terms of actual technical ratios, an average firm had Rs 2.12 lakh of investment in total capital per employee, Rs 3.14 lakh of that per worker, and Rs 10.99 lakh of that per

skilled worker. The corresponding figures for fixed capital are Rs 1.20 lakh, Rs 1.73 lakh, and Rs 5.74 lakh, and for plant and machinery Rs 0.81 lakh, Rs 1.2 lakh and Rs 3.93 lakh, respectively.

V Industry Performance

Industry performance is analysed through several parameters, which are classified into financial, physical and economic factors. Due to their confidential nature, no data could be obtained on various measures of the profitability. Data on physical performance as measured by growth rates in turnover, and all three measures of capital input, and capacity utilisation, and on economic performance as measured by factor productivities, value added and contribution to subsidy ratio by products are provided in Table 4.

All	117	17	12	12	10	43	184	16	42	35

* More than one fuel/sales mode for a firm is possible.

The growth rate in turnover is very impressive. For all the firms, it stands at 46.6 per cent per annum, with a maximum of 67.3 per cent for firms in dyes/pigments intermediates and a minimum of 19.1 per cent for units engaged in drugs manufacturing. The growth rates in various measures of capital have been close to that in national income. In particular, for all firms, while total capital has grown at the rate of 7.2 per cent, the fixed, and plant and machinery each have grown at about 5 per cent per annum. This implies that the working capital has grown faster than the fixed capital. An analysis of productwise growth rates reveals that the growth rate in capital has generally been more in products like resins and organic chemicals, and less in pigments and medical products. Capacity utilisation for all firms has averaged at 56.2 per cent, with the maximum of 86.8 per cent in inorganic chemicals and the minimum of 37.5 per cent in drug intermediaries. Thus, the various measures of physical performance rank different products differently.

Looking at the labour productivity, one finds that an average employee contributes Rs 5.77 lakh to the turnover for all chemical products. The said productivity is the maximum at Rs 7.68 lakh in organic chemicals and the minimum at Rs 1.17 lakh in medical products. The corresponding figures for workers' productivity are Rs 9.14 lakh (all products), Rs 15.22 lakh (inorganic chemicals), and Rs 1.72 lakh (medical products), and for skilled workers' productivity are Rs 32.57 lakh (all products), Rs 67.35 lakh (drugs) and Rs 11.47 lakh (medical products), respectively. Thus, in terms of labour productivity, medical products is the least attractive goods to produce. The findings on capital productivity suggest that a rupee of investment in total capital has produced Rs 3.2 worth of sales for an average product, with the maximum of Rs 4.2 in dyes/pigments intermediates and the minimum of Rs 1.3 in medical products. The fixed capital, and plant and machinery form about one-half and one-third of total capital, respectively and accordingly their productivities are about twice and thrice of that of the total capital. Again, while there is no uniformity with regard to the maximum capital productivity across products, medical products happens to have the least capital productivity on all the three measures.

Two new measures of economic performance have been used in this study. These are value added fraction and contribution to subsidy ratio. The former (VA) is defined as the ratio of sales revenue (S) minus value of raw materials consumed (RM) divided by the value of raw materials consumed: $VA = (S - RM)/RM$. The latter is computed

as the ratio of the firms' contribution to the exchequer (by way of excise, sales tax, octroi and corporate tax) to the amount of subsidy (including sales tax incentives) received by it during its existence. An analysis of the findings reveal that the value added for all products stood at 38.8 per cent, with the maximum of 67.8 per cent in medical products and the minimum of 32.7 per cent in dyes/pigments intermediates. It is interesting to note that while medical products have the least factor productivities, it

has the most value added fraction. Since value addition is shared by labour and capital, in spite of the low factor productivities, firms would be tempted to go for medical products. The last measure, viz, contribution to subsidy ratio stands at 28.4 for all firms, with the maximum of 85.7 for inorganic chemicals and minimum of 0.1 in medical products. Thus, from the government revenue mobilisation point of view, inorganic chemicals and resins manufacturing units are the ones to encourage.

Thus, as usual, different performance measures do not yield consistent results. Nevertheless, they generally suggest above average performance for firms producing resins, dyes/pigments intermediates, organic and inorganic chemicals, and below average performance for those engaged in manufacturing pigments and medical products.

VI Analysis and Implications

There is a nexus between structure, conduct and performance. While the traditional theory argues for the uni-directional relationship, in which, structure affects conduct and conduct influences performance, the modern theory suggests the interdependence of these three aspects [6]. To assess these relationships, we have analysed the data through cross-variable tabulation, which are presented in Table 5. In this table, rows contain performance/conduct variables and the columns the significant structural variables. The entries in the table give the values of the structural variable when the performance variable takes the maximum and minimum values. For example, turnover was maximum at the firm's age of 28.9 years and minimum at the age of 7.9 years. Two of the six structural variables in the table are quantitative. It is useful to note their minimum and maximum values in the sample firm. Thus, the minimum age was one year and maximum age was 59 years. The said values for the promoters' time spent per month were one day and 30 days, respectively.

The findings in Table 5 do reveal the interdependence between performance/conduct and structure. However, there

appears no definite relationship between most of them. The striking findings may be summarised as follows:

(a) Among various products, drug attained the maximum turnover, medical products the maximum value addition fraction, and inorganic chemicals the maximum capacity utilisation. Organic chemicals and dye/pigments intermediates, in general, had the most labour and capital productivities. Capital intensity was, in general, the least in medical products.

(b) The middle aged firms (around 25-29 years) were ideal to maximise turnover, value

addition fraction, capacity utilisation and capital productivity, and also to minimise the capital-labour ratio. In contrast, relatively young firms (around three years age), in general, had attained maximum values for labour productivity.

(c) Relationship between performance and promoters' time appears quite dubious. While capacity utilisation and two of the three measures of labour productivity are maximum, the value addition fraction is minimum, if the time spent is maximum at 30 days/month. Capital productivity is the most if the time spent is 11-12 days/month,

and the least if it is 19 days. Both the turnover as well as the capital intensity are maximum if the time spent is around three days/month.

(d) Partnership form of organisation, in general, has performed better than others in terms of value addition, capacity utilisation, capital productivity and low capital intensity. In contrast, the private limited firms have outperformed others with regard to turnover and labour productivity. Proprietorship firms, in general, performed poorly on most of the fronts.

(e) While technology sourced through hired persons yielded maximum total capital as well as total employee productivity, that sourced through in-house development ensured maximum fixed capital and workers productivity, and that sourced through self-experience gave maximum productivities for plant and machinery and skilled workers. The capital intensity was consistently the lowest when the technology was sourced either through buying indigenously or taken from other plants.

(f) Firms located in Baroda and Ahmedabad districts attained the maximum capital and labour productivities, those in Baroda the maximum turnover, and those located in Kheda, the maximum capacity utilisation. The capital intensity was generally low in firms located in "other" districts, and high in Mehsana located units.

From the above findings, no clear pattern emerges. Nevertheless, the following generalisations could be suggested:

- If physical performance is the yardstick, then go for drugs, medical products and inorganic chemicals production, middle

aged, partnership and Baroda-Mehsana location.

- If labour productivity is to be maximised, then produce organic chemicals, inorganic chemicals or drugs; the most suitable organisation would have about three years age, a private limited form, located in Ahmedabad/Baroda districts, and the promoters will be spending all their time in the works.
- If capital productivity is the criterion for success, then produce drug/pigment intermediates, drugs or resins, have around 30 years aged firm, partnership form, promoters' spending about one-third of their time, and located in Baroda/Ahmedabad districts.
- If labour intensity is to be maximised, then produce medical products or pigments, go for about 30 years age, proprietorship/ partnership form, promoters' spending about one-half of their time, sourcing technology through buying indigenously, and locate in "other" districts.
- If government revenue maximisation is the criterion, then go for inorganic chemicals, and resins and allied products.

VII Conclusion

The paper has presented the first-hand information on the structure, conduct and performance, and analysed the nexus among them for the small-scale chemical industry in Gujarat. The findings are subject to the sample but since the sample is more or less unbiased, we expect them to be generally valid for the industry. No causa-

tion model was developed and thus we offer no clues to one-way or the two-way relationship among structure, conduct and performance. The paper has examined the association among their various measures, and has thrown some light on their patterns. We hope the study would be useful to the entrepreneurs, financial institutions, policy-makers and researchers in the field.

Lost Opportunity

T V Sathyamurthy

Crisis and Change in Contemporary India edited by Upendra Baxi and Bhikhu Parekh; Sage Publications, New Delhi, 1994; p 453, Rs 250.

THIS book is a 'shraddhanjali' in honour of a philosopher and teacher at the Maharajah Sayaji Rao University Vadodara. During the heady decade or so immediately following independence, Raojibhai Patel (affectionately known to his 'chelas' as 'Mota'), now in his 80s, taught mathematics. But as a Marxist thinker and a quondam Royist Radical Democratic Party activist, his chief passions lay in philosophy, social theory and Indian history and politics (p 432).

Patel played a dynamic role in providing a haven for enthusiastic and intellectually driven students (and young lecturers) who were frustrated by the essentially bureaucratic structure of the university and whose development was stultified by the institutional inertia engendered in its narrow-minded and anti-intellectual ethos. His relationship with the young minds that gravitated towards him was rich, many-sided and multi-layered.

Patel was deeply imbued with Marxist thought in general and Marxist method in particular and has remained a critical defender of Marx's basic ideas even after the collapse of communism. He resisted Royism when M N Roy's followers abruptly abandoned Marxism and supported America's imperialist policy towards Indo-China. More recently, Patel has not been tempted by modish intellectual styles, fashions and credentials paraded by time-serving intellectuals who now disport themselves under the banner of 'ex-Marxist' or 'erstwhile Marxists'.

It would appear that Patel played the role of a local savant whose influence on the organisation of Baroda University teachers (of which he was the founder) was as considerable as his impact on enthusiastic young teachers on a personal and moral level. It is entirely in keeping with the Indian intellectual milieu that a volume of "essays by diverse hands" should be brought together as a tribute and as a mark of appreciation of the signal contribution made by such a person to the formation and nurturing of two generations of socially and politically aware and clear thinking intellectuals.

The book consists of 17 substantive essays (not including a summary introduction by one of the editors less close to Patel than the other who has written a brief appreciation of him in the final chapter), not all of which have been written by authors with an intimate knowledge of or direct familiarity with Raojibhai Patel.

Of particular interest to readers must be the essays of those who have known Patel well. They include, among others, Upendra Baxi, Rajni Kothari, Ashis Nandy, Thomas Pantham, Bhikhu Parekh and Dhirubhai

Sheth. The essays contained in the selection cover, unevenly, a wide variety of topics ranging from ideology, politics and sociology to psychology, culture and ecology. The editors would appear to have made no special effort, apart from a cursory summary of the essays seriatim, to provide the work as a whole with the lineaments of systematic coherence.

A major shortcoming of the book, therefore, is its singular lack of character. Only a few of the essays in it bear the mark of distinction relevant to the commemorative remit of the volume. A span of 40+ years in the life of a leading (though not widely published) intellectual is a convenient interval in which to assess the changing relationship between the challenge posed by development (including questions relating to justice, human rights, etc, in a rapidly transforming system of international relations) on the one hand, and on the other the intellectual apparatus that a committed thinker has to bring into shape in order to address the task of spreading an understanding of the links between global, national and local problems.

Raojibhai Patel has influenced the understanding of three generations of peers and students who have come into contact with him. His life has thus provided an excellent example for distinguishing between formulaistic Marxism and study based on Marxism as the provider of a critical method of approach. At the same time, great changes – environmental, political, economic, social and international – call for adaptations of our worldview in order better to comprehend reality.

A 'shraddhanjali' undertaken in a spirit of exploration of these connections and attempting to draw out useful threads linking the past with the present and the future would have been an appropriate tribute. In the work as it stands, there is an unfortunate distancing on the part of the editors and a number of contributors from the task of methodological and theoretical clarification of Raojibhai Patel's worldview and of showing the processes of adaptation to changing realities of an intellectually formidable analytic scheme to which he subscribed. In this sense, the editors have missed a very good opportunity because of the failure of the contributors to empathise with the person who has inspired this tribute. In registering a general feeling of dissatisfaction, I have no wish to underestimate the individual worth of a few of the essays.

Chapters 2-7 deal with the legacies of Nehru, Gandhi and Ambedkar separately rather than in a comparative manner. Parekh's discussion of Nehru's thought in the context of "the crisis of modernisation" adds little

to our knowledge and understanding of an over-worked subject, traversing thoroughly familiar ground in an unattractively chatty style. The essay ends with a conflation between Nehru's ideas on modernisation and the current craze, the advocates of which see Nehru's legacy as a hindrance rather than as a precedent. Gandhi attracts a slightly better quality of exegetical review than does Nehru. Brown broadens the canvas of Gandhi's influence to cover the world outside India in the contemporary era. She makes the point that whilst Gandhi's experiments and ideas cannot be easily borrowed (i.e., transplanted, I suppose) "across the barriers of time and culture", his radical vision and his pragmatic method are as germane to our times as they were in South Africa and in India in the past.

Thomas Pantham does provide a view of Nehru and Gandhi together in the context of modernity. Unfortunately, his analytical effort is vitiated by too deep an immersion in a borrowed frame ('Modernity of Tradition' thesis, or somewhat ambiguously in our age of 'motor cars', shortened as 'MOT', a test which the essay does not quite pass!). The three ingredients of the essay – Gandhi's resuscitation of India's cultural tradition, sauteed with "some of the values and institutions of modern politics", which is seen as being in creative tension with Nehru's vision of the future, and the problematic antithesis between "scientific rationalism" on the one hand, and the moral intuitiveness of Gandhi on the other – have not been worked out satisfactorily, let alone brought together in an illuminating manner. A big price to pay for relying on 'authorities' rather than on one's own thought processes in order to make connections!

Of the first tranche of six essays, Baxi's discussion of Ambedkar is the most interesting. Starting with a remark about the marginalisation of Ambedkar by "the communities of knowledge and the communities of power in India", Baxi has identified seven different aspects of Ambedkar's role as an authentic dalit, an exemplar of scholarship, an activist journalist, a pre-Gandhian activist, a truce-maker with Gandhi (Poona Pact), a constitutionalist, and as one who ultimately renounced Hinduism and embraced Buddhism. This is followed by a discussion of the bitter conflict between Ambedkar and Gandhi on the issue of separate electorates, identification of 10 theoretical/ideological questions arising out of the political context in which Ambedkar launched his struggle for the emancipation of dalits, and Ambedkar's documentation of the history of oppression of Ati-sudras in Indian society. The concluding section raises important questions of theory and is especially noteworthy for Baxi's interpretation of the limitations of the liberal framework and the possible avenues to transcend them in order to create a "wide-ranging programme of equality and equity measures aimed at the fulfilment of a wide

variety of material and non-material needs" (pp 146-47).

The remaining 12 essays are not connected by any discernible thread. Some of these are good, some others not so good, yet others indifferent. Ignoring the continuities between the two periods, Kothari draws a distinction between pre-1967 and post-1967 India. In the changing context of politics, the state has, in his view, undergone a process of partial de-legitimisation and politics has degenerated in quality as it has shown itself incapable of coping with rapid social change. The need of the 1990s is to tap into the potential "for generating a political process that spans both the local and the national (and the international)" (p 164). Kothari is disappointed with the lack of "response from above" (p 167) of the Indian elite (surprise!, surprise!!).

Rouner provides a typically American (or should we now recharacterise it as Blairist?) "stakeholders' view of democracy" (the rationale for the choice of some of the contributors to this volume is intriguing to say the least!). This is followed by Sheth's essay on "the great language debate" involving the politics of metropolitan versus vernacular India. He cogently argues that in the wake of the politicisation of the language controversy in India, the continued predominance of English has contributed "to creating a big divide between metropolitan India and mofussil India, between the centre and the regions". The way to weaken the prevailing dual system of education will consist of re-orientating the role of English – i.e., ensuring its survival on functional terms and ending its role as an instrument of elite domination.

North American political science (especially in relation to the third world) has, in recent years, changed its prevailing shibboleth from 'law and order' during the 1960s (which itself was introduced as a more desirable alternative to 'democratic norms') to 'governance'. Mitra's essay represents a curious amalgam between this received paradigm and a concern for democracy. He explores the link between democracy and the crisis of governability instead of pursuing the much more interesting and potentially useful theme of governance and the crisis of democracy. Even the choice of the words 'crowds' (to refer to the mass of the people) and 'power' as a concept antithetical to it betrays a deep distrust on the author's part of the contribution made by the numerous initiatives that different segments of the population have adopted in order to minimise the systematic abuse of power by those in positions of authority in the state structures and to innovate forms of co-operation and methods of reaching democratic consensus in order to improve the style and content of politics.

To a certain degree, albeit from a psychological rather than a political angle, this area of concern is addressed in Desai's

essay despite his over-emphasis on leaders and under-emphasis on ordinary individuals. Nandy makes a more radical statement, more appreciative of the enormous gulf in status and power between the guardians of the tools of modern applied sociology and those who subscribe to alternative or rebel paradigms. He makes the point that good psychology may be useful "not as an instrument, but as an intervention in contemporary social consciousness".

Sandwiched between the 11 chapters on political, sociological, ideological and psychological questions and the last four substantive chapters, is a thematic and methodological loner – happily, a cogently and more or less fully laid out empirical picture of "the health scenario in India" by Mehta. She argues in favour of an integrated package of health including family planning and development and points to the ineffectiveness of the fragmented approach to the problem of health care.

Chapters 14-18 deal with religion, communalism, culture and environment. Kaviraj, who has written one of the four really good essays in this volume, has drawn attention to the unreplicability of modernity in India along a trajectory familiar in western historical experience. The role played by religion in the unravelling of political processes varies from epoch to epoch, from civilisation to civilisation. Cultural factors play a crucial role in the elaboration of this extremely complex relationship. The task of social science is to investigate, not extrapolate.

Bhargava's essay explores the nature of religious and secular identities. He draws attention to four different forms of identities. Of these, the identities of high ideals, of multiple values, and of "a culture of plurality infused by a sense of high ideal" constitute the basis of his discussion of religious identities and modern, secular identities. Bhargava seems to suggest a way out of the current impasse in Indian politics caused by the rising power and electoral popularity of the BJP, by means of attempts to understand how religion, modernity, tradition and secularism operate in the different cultures "of unfettered desire, of multiple values, of ultimate ideas that bypasses (*sic*) multiple values, and in the other mature culture that passes through these multiple values" (p 346).

Mahajan's pompous essay on cultural embodiment and histories comes as an anticlimax after the substantial and sophisticated contributions of Kaviraj and Bhargava. She seems to be adrift in a sea of confusion between the adjustments that it is necessary for modern political structures to make in a social setting in which religion continues to play a vital role in quotidian life and the nexus between the individual and the community following Heidegger's example. Canning and name-dropping apart, Mahajan's essay stands as a singularly unilluminating contribution in this volume.

Patel's sociological explanation of communal riots in contemporary India is an empirical exercise of considerable worth, showing the qualitative and quantitative changes in the phenomenon of communal violence in India since the 1940s. An outline of the different explanations for the occurrence of riots is followed by a comparative treatment of the 1969, 1981 and 1982 Vadodara riots. This is richly interspersed with clear accounts of the overlapping role of different actors (catalysts and promoters alike) – "politicians, police and bootleggers" – and a clear delineation of the forces underlying the communal violence that "are deeply embedded in the social structure of the city". He discusses these interrelationships using the concepts of 'social structure', 'social processes' and 'social ecology'. In the final section he makes a serious and largely successful attempt to place the Vadodara riots in a wider and largely comparative perspective of communal violence in north India as a whole. Rather than assuming that such conflicts occur between mutually antagonistic but internally homogeneous communities, analysts should attempt to explain the social processes by which internally heterogeneous social communities experience social strains which translate themselves into violent conflicts. A most satisfying essay indeed.

Pravin Sheth's essay on the ecopolitics of the Sardar Sarovar project demonstrates the creative character of the conflict between the forces of democracy (in the three vital geographical areas covered by the project) on the one hand, and on the other the authorities at the centre and in the states (of Gujarat and Madhya Pradesh) who would have preferred to get on with the project with the aid of the World Bank untrammelled by opposition of any kind. Sheth believes that the Narmada Project may turn out to be the best of its kind in India.

The democratic process has enabled grass roots activists to insert the maximum corrective inputs in the 'revised' project plan through commendable intellectual home work and persuasive perseverance and national-international networking (p 425).

In the light of continued agitation and of the devious and bullying tactics adopted by the Gujarat government (at the present time as under the Chimanbhai Patel regime), Sheth's assessment may sound prematurely conclusive if not over-optimistic. But there is no doubt that the politics of resistance surrounding the Narmada dam represents an important chapter in the contemporary story of India's experiment with democracy.

Despite the lack of a unifying thread that would have constituted an appropriate homage to a savant who exercised a defining role in the shaping of at least two generations of intellectuals at the M S University, this book stands redeemed by its best essays (those by Upendra Baxi, Rajeev Bhargava, Sudipto Kaviraj and Pravin Patel).

International Trade and Long-Term Economic Growth

A Few Issues of Growth Strategy for India

Murali Patibandla

For developing economies, technological change and micro-level efficiency is as important as capital accumulation as a source of long-term economic growth. International trade is an important source of incentives in generating both intentional and by-product technological change by increasing aggregate economic activity (market size) and competitive conditions. In the present context, selective policy intervention on the production side may provide a cutting edge in realising dynamic gains through trade.

I Introduction

THE analysis of long-term economic growth has emerged once again as central topic of mainstream economics as developed countries themselves have had to worry about stagnant or slow growth in real incomes during the last 20 years. While in developing economies the main emphasis has been on capital accumulation as the major source of growth, for developed economies it is on technological change. In the context of continuous and rapid technological changes in the international markets, how accumulated capital is utilised to generate technological change and higher labour productivity is as important as capital accumulation in developing economies. The endogenous growth theory pioneered by Romer (1986) and Lucas (1988) sheds some light on how technological change is endogenously generated by micro- and macro-level incentives emanating from market conditions and the policy and institutional regimes.

The classical growth model of Solow (1956) is based on the assumptions that technological change is exogenous and it is a public good. The assumptions imply all countries (both developed and developing) should be on a similar technology frontier because, under these assumptions, diffusion of technological change is instantaneous. Obviously, both the assumptions are only partly right because most technological change is endogenous caused by deliberate efforts of economic agents and it is not a public good. Some technological discoveries might be exogenous caused by random factors, but the aggregate rate of discoveries are endogenous caused by deliberate efforts and the level of economic activity. The non-public good nature of discovery is one of the major incentives for deliberate efforts in modern economies and a source of rents to

innovators. International trade is one of the major sources of increasing aggregate economic activity and also incentives for deliberate technological efforts.

Empirical studies of cross-country comparisons provide certain stylised facts which show a positive correlation between long-term economic growth and variables like trade openness of an economy, government investment expenditure (as against consumption expenditure), and investment in R and D, primary and higher education.¹ Trade openness of economies has been observed to be a major source of growth. In the decade of 1980-90, while world GDP grew at a rate of 3.2 per cent, world exports grew at 4.3 per cent. For China and India together for this period, GDP grew at 7.6 per cent and exports at 9.8 per cent [Cooper 1995].²

In the static framework of the classical trade theory, free international trade does not increase endowment of capital (capital accumulation). Under the assumption of perfectly competitive markets, free trade improves the static allocative efficiency of resources across trading nations, which in turn increases real incomes. In the trade theory of imperfect competition, trade increases production runs and reduces average costs and prices under the presence of economies of scale in production of manufactured goods which, in turn, increases real incomes across trading nations [Patibandla 1994]. In a dynamic framework, increase in incomes leads to increase in savings and investment (capital accumulation). International trade may also generate positive externalities, learning by doing economies and provide incentives for technological change through increased competitive conditions and extension of market size (division of labour). For developing countries, economic growth requires not only factor accumulation but also narrowing technology gap with

developed economies. They need to have a certain minimum level of initial industrial skill and agricultural endowments in order to realise dynamic gains of international trade. Policy intervention could be towards generating these minimum necessary endowments. In the east Asian countries, selective policy intervention, apart from creating the minimum initial conditions, facilitated generation of dynamic gains and consequently high growth in a relatively very short period of time.

The blanket import substitution policies pursued by India and Latin America in the past, where the policy regime discouraged both exports and imports, were based on the assumption that international trade with developed countries leads to immiserising growth through worsening of terms of trade, based on the Prebisch (1950) and Singer (1950) hypothesis. This paper argues that several elements of the Prebisch and Singer hypothesis, which has been questioned by a dominant part of development economics literature by citing the east Asian experience [World Bank 1990], are still valid for developing economies. However, the solution lies in not blocking trade but in careful selective policy intervention on the domestic production side that provides appropriate incentives for technological change. One of the major differences between the South Korean and the Indian policy regimes is that while India followed blanket import substitution with a highly over-valued exchange rate, South Korea followed selective import substitution with competitive exchange rates (since 1964). This facilitated exploiting the initial static comparative advantage in labour-intensive industries while the selective policy intervention created dynamic comparative advantage in capital-intensive high technology industries [Westphal 1990]. This paper argues that the policy in India should encourage exports of industries that have

static comparative advantage while simultaneously providing appropriate incentives for technological change. The scope of this paper is rather narrow, as it deals with only certain aspects of the link between trade and growth.

II Validity of the Prebisch and Singer Hypothesis

The main premises of the Prebisch and Singer hypothesis were: (1) a secular decline in the terms of trade for exports of primary goods of developing economies would result in an ever-growing widening of the gap between rich and poor countries in the absence of industrialisation in the poor countries, and (2) in order to industrialise the poor countries should protect their infant industries from imports [Edwards 1993].

The essential message of the hypothesis is still valid to developing countries. But how it is absorbed and implemented could be the explaining factor between the success stories of the east Asian countries and the relative failure of India and Latin America. This is illustrated by a comparative analysis of South Korea and India. South Korea and India followed broadly similar industrialisation strategy [Datta Chaudhuri 1990]. The difference was that while India followed blanket import substitution while keeping the exchange rate highly overvalued, South Korea promoted exports by maintaining a competitive exchange rate regime. This enabled South Korea to exploit static comparative advantage in international trade by exporting labour-intensive goods in the beginning, while the selective policy intervention created dynamic comparative advantage in specific capital-intensive sectors through selective and time-bound import protection, provision of capital at differential interest rates, etc [Westphal 1990; Pack and Westphal 1987]. As the comparative advantage shifted to modern industries, South Korea's terms of trade improved. Increase in labour productivity and volume of trade resulted in increase in real wages. These dynamics of the growth process had a two-way causation between trade and growth. In India's case, the overvalued exchange rate mechanism restricted her from exploiting static comparative advantage in labour intensive goods by making exports in general unprofitable. Secondly, the policy mechanism created inefficiency in the use of capital and other inputs in the capital-intensive sectors that were promoted. Consequently, the policy regime failed to take advantage of static comparative advantage and to create any significant dynamic advantage in the capital-intensive sectors [Patibandla 1993].

III Sources of Growth and Terms of Trade Effect

As mentioned earlier, the blanket import substitution policies of India and Latin American countries were based on the premise of adverse terms of trade effect of free trade with developed countries. The inimical effect of decline in commodity terms of trade on per capita incomes owing to growth in export sectors depends on the sources of growth. If growth is because of increase in inputs like labour, it will cause a decline in per capita income. But if growth is due to technical progress, decline in commodity terms of trade need not lead to decline in per capita incomes.

The above observation is illustrated through the single factorial terms of trade equation: $(P_x/P_m)(X/L)$. P_x is the price of exports. P_m is price of imports which is assumed to be constant. X is the output of the exportable commodity. L is the one input used to produce X . (P_x/P_m) captures commodity terms of trade and (X/L) refers to labour productivity in producing X . We take the country to be large in the world market for X , so any increase in supply of X leads to decrease in P_x . Growth in X can take place because of increase in input of L or due to increase in productivity of L , i.e., technical progress. Growth in X leads to decline in P_x owing to increase in supply of exports. If growth in X is because of increase in L , (X/L) could remain unchanged but (P_x/P_m) decreases worsening per capita incomes in the exporting sector (the extent of this depends on the elasticity of export demand). If growth is arising from technical progress decline in (P_x/P_m) can be offset by increase in (X/L) . If increase in (X/L) is more dominant than decline in (P_x/P_m) , it leads to increase in per capita incomes even if the commodity terms of trade worsen. A simple example of this is that both the US and India export agricultural goods. In the US, only 4 per cent of its population shares the income generated in agriculture whereas in India 60 per cent of the population shares the income generated by agriculture. The adverse terms of trade effect on per capita income is more dominant if growth of output is mainly because of increase in labour supply (population).

Standard growth theory shows that capital accumulation leads to increase in labour productivity and wage rate by providing labour to work with capital equipment. If capital accumulation is mechanical, in terms of increasing the number of similar type of machinery, it will be subject to diminishing returns to capital. If capital accumulation is in terms of skills and knowledge acquisition (through learning by doing and investment in education) and embodied technolo-

gical change, diminishing returns to capital will not take place as shown by the endogenous growth theory. Here, the issue of how accumulated capital is invested and utilised becomes germane. If the accumulated capital is used to bring improved machinery and improved intermediate goods, through investment in knowledge capital, it may lead to increasing returns to capital. Capital accumulation in terms of skill acquisition may be largely related to learning by doing economies (apart from investment in human capital) which, in turn, depends on output growth. For economies with small domestic market for industrial goods, exports function as a source of extension of the market size which facilitates learning by doing and also generation of externalities.

The importance of technological change and its implications on terms of trade and growth in developing countries can be seen also in Krugman (1979) also which applies product life cycle theory to shed light on terms of trade between developed and developing countries. Its essential logic is similar to the main elements of the Prebisch and Singer hypothesis. Technological change is concentrated mostly in the north. The terms of trade tend to be adverse to the south because they pay a form of Schumpeterian profits to the innovators in the north in the form of high product prices, where new innovations first occur. On the product life cycle while the south begins to export the product whose price has fallen, new products will have been developed in the north, which they will sell to the south for prices high enough to cover their wages and to earn some Schumpeterian profits. Hence, an intrinsic aspect of the product life cycle process is that the technology initiating high wage economy reaps high prices for its products relative to technology receiving low wage economies and the profit income is mostly in the north.

Lau's (1996) cross-country study shows that for developed countries, technical progress is the main source of growth. In developing countries despite high rates of growth and rapid capital accumulation in some of them, the rate of technical progress have been found to be statistically insignificant. Given these findings he argues that developing countries should look ahead and begin to plan to devote a greater proportion of their resources to indigenous research and development. This is especially urgent given the long gestation periods for and uncertain returns on such investments in intangible capital.

One of the reasons for lack of innovative R&D in India in the past has been attributed to small size of the domestic market and the policy regime [Lall 1987; Desai 1982]. R&D investment involves fixed and sunk costs. Access to a large market is needed to spread fixed costs and reduce risks. The argument

that small domestic market not only constrains R&D investment but also causes production at sub-optimal scales is still valid for many Indian industries. The policy that targets encouraging of R&D efforts towards generating technological change in India need not encompass all industrial sectors. Given certain country specific advantages, specific local industries might be more successful in generating innovations: for example, software, auto components, and two-wheelers, etc. Industries like auto-components and software have a starting (static) comparative advantage owing to availability of inexpensive skilled labour, which facilitate exports. Exports, in turn, extend the market size and reduce the risk element of R&D investment. Furthermore, the extension of market size through exports should increase the cumulative output of exporting firms. This, in turn, can cause significant learning by doing and reduction in costs in those industries.³ These advantages arise not only through R&D expenditure but also by deliberate efforts by firms towards improving the production processes. Competitive export markets will put pressure on firms towards undertaking deliberate efforts. Trade openness may also increase the capacity to absorb technologies developed in the advanced nations and to generate innovations locally [Grossman and Helpman 1991; Edwards 1992].

The above observation can be illustrated with the example of the Indian software industry. India has a strong comparative advantage in the software industry due to skill endowments which has caused exports of software to grow from Rs 50 crore in 1985 to Rs 1,535 crores in 1995 with an average annual growth rate double the world average. The generation of wage and especially profit income through exports of this industry depends on at what stage of the product life cycle the domestic industry is in the context of rapid technological changes in the world market. Investment in R&D and generation of innovations facilitate the industry to be on the initial phase of product life cycle by generating successful innovations and increase profit income of the domestic industry. Initial access to growing domestic and export markets reduces risks and enables spreading of fixed costs in R&D investment. This is where policy can provide a cutting edge by giving certain incentives for R&D investment by facilitating effective protection of intellectual property rights, fiscal concessions, investment in infrastructure and education, etc. A similar argument may apply to a few intermediate goods industries like auto-components and two-wheeler industry which have a very strong and growing domestic demand.⁴ As mentioned before, investment in knowledge capital in these industries is subject to strong increasing returns to scale

and exports magnify these returns by extending the market size which, in turn, may generate cumulative learning economies.

A few of the above observations are tested empirically on the basis of firm-level panel data drawn from the Indian light commercial vehicles industry. The data are drawn for two major corporations: Tata Engineering and Locomotives and Ashok Leyland for the period of 1985-86 to 1994-95. The data are drawn from the Confederation of Indian Industry's (CII) annual publications relating to the 'Top Hundred Companies'. We use a simple theoretical model as the basis for the specification of equations for empirical testing.

IV The Model

We take domestic oligopoly firms to compete in Cournot quantity space in the home market. On the basis of the assumption of small country in the world market, we take domestic firms to be price-takers in the world market. The domestic market is protected from imports. Both assumptions are highly justified for most of the Indian engineering industries. We take two firms i and j , but results are generalisable for more than two firms.

The profit function of firms is.

$$\Pi_i = P(x_i + x_j)x_i + P_w x_i^* - (1/2)c_i(x_i^*)^2 \dots (1)$$

P is the domestic market price, P_w is the world market price, x_i is domestic sales, x_i^* refers to exports and c_i is the parameter of the cost function.

By solving for the profit maximising conditions, we get domestic sales and exports in equilibrium as follows:

$$x_i = (P_w - P)/P'(\cdot) \dots (2)$$

$$x_i^* = (P_w/c_i) - x_i \dots (3)$$

From equation (2) we can see that a decrease in c_i leads to increase in exports.

$$c_i = f(R\&D_i, IM_i) \dots (4)$$

$f' < 0$;

$R\&D_i$ = Intensity of expenditure on research and development.

IM_i = Intensity of imported intermediates and raw materials in production.

On the basis of equations (2) and (4), we hypothesise that increase in R&D expenditure and imported intermediate goods in production leads to reduction in costs and increase in exports.

V Empirical Analysis

Measurement of Variables

E/S = exports to sales ratio

R&D = research and development expenditure/value-added

IM = Imported intermediates and raw materials/value-added

Z = an index of relative firm level production efficiency

Firm level efficiency indices are measured on the basis of Farrell's (1957) production frontier approach. Recent development in the efficiency frontiers literature show the derivation of plant-specific time-variant technical efficiency indices by using panel data. The production function defines the maximum possible output a firm can realise for a given level of inputs employed, given the technology level. Farrell's method shows relative technical efficiency as the extent of deviation of output realised by a firm (for a given level of inputs employed) from the best practice in an industry. We adopt the model of Cornwell et al (1990) which allows the rate of productivity to vary over time and firms. The residuals of the estimated (Cobb-Douglas) production function are used in deriving the efficiency indices.⁵

As the variables are mutually interdependent and there could be simultaneity in relationships, we estimate the causality in different stages (the correlation coefficient between R&D and export intensity variables is as high as 0.51 for this industry). There could be a two-way causality between the efficiency variable and export intensity especially if there are economies of scale in production and dynamic external economies in export activity. High degree of production efficiency is required to compete in the international markets and exports extend the market size and reduce average costs of production if economies of scale are present and also information and technology externalities that arise through export activity leads to reduction in costs to exporting firms. Since we are making use of panel data and R&D and IM variables could be reliable instrumental variables, the following exercises do provide reliable results. IM variable can be treated as exogenous because increase in the use of imported intermediates could be a result of the trade policy reforms in terms of drastic reduction in import duties on intermediate goods. The decision to invest in R&D by firms might be a result of degree of domestic competition. Increase in domestic competition makes firms undertake cost reducing efforts and investment in R&D and imports of inputs are made towards cost reduction. R&D investment may also be determined by the extent of imports by firms if it is towards adapting imported technology to local conditions. In other words, we can take costs of firms depend on R&D and IM; R&D investment is a function of degree of competition. The competitive dimension operates mostly from the domestic market and also export markets depending on the degree of export orientation of firms [Patibandla 1996a]. Since exports can take zero values and the efficiency is bounded to values between zero to one, ordinary least

The Peerless General Finance & Investment Company Limited

Chairman's Statement

D. N. Ghosh

The following is the Statement made by Mr. D. N. Ghosh, Chairman, The Peerless General Finance & Investment Company Limited, at the Sixty-third Annual General Meeting of the Company, held on November 18, 1996

This year is a watershed year for Peerless. The Hon'ble Supreme Court in its judgement dated 4th January, 1996, ruled that the Reserve Bank of India had the right to decide on the service charge payable by the depositors and advised your company to make suitable representation in this matter before the RBI. The RBI in its latest direction has allowed charging one-time non-refundable service charge of Rs. 80/- per annual deposit of Rs. 500/- or less.

In compliance with the Supreme Court judgement and directives of the Reserve Bank of India, the Company has made fundamental changes in its accounting policies and procedures. Earlier the Company had been utilising a portion of deposits collected in the first year by way of service charges towards cost of collection of deposits and payment of commission to the field agents. This practice has been discontinued following the RBI guidelines. Consequently, adjustments have been made in the current year's accounts in respect of the entries pertaining to service charges made in the accounts for the past years. After taking into account, what has been authorised by the RBI, the quantum of adjustments made is Rs. 771 Crores and accordingly the liability

outstanding on deposit account has been reassessed at Rs. 5383 Crores. With the drastic curtailment in the amount of service charges, which can now be taken to the income account, the Company has reported a loss for the first time in its history. Efforts are on to correct the mismatch between income and expenditure and restore the Company back to profitability. I should clarify, however, that the Company's capability to discharge maturity obligations to the depositors, as and when these become due, remains unimpaired.

The set-back in the current year should not make us lose sight of the core competence which Peerless have developed over the last 65 years in the task of mobilisation of savings and also a credibility established in the large number of depositors by refunding about Rs. 950 Crores to them on maturity. Its method of collection of savings from small depositors, from weaker and informal sectors of economy and from the rural and semi-urban areas has been unique. The savings could have remained untapped despite the presence of Banks and other institutions. By unearthing such savings and investing them primarily in public institutions in the manner as required by the RBI, the Company can take legitimate pride that it has been making its own humble contribution to the national cause.

In this task of mobilisation the field force of the Company has been an important link. Their contribution to the growth of the Company has been commendable. However, the recent developments have made it incumbent on the Company to restrict commission to levels which the Company can afford to pay as per the RBI guidelines. We do hope that the field force will understand these compulsions and start the work afresh with renewed vigour.

Times are changing. In the face of multi-product availability, the depositors are becoming more demanding. We have to design new savings schemes which can cater to their emerging needs. The Company's commitment to service will remain, as before, but we have to recognise that we have to change our ways of functioning to survive in this highly competitive

environment. The cost of mobilisation of deposits have to be contained by rationalising the commission structure and targeting an optimum mix of fresh collection and renewals. The drive for mobilisation of deposits have to be selectively targeted for specific areas. Systems have to be installed for close and continual monitoring for the achievement of these targets. The existing and future assets have to be managed efficiently to increase the yield on average assets. Recovery of non-performing assets has to be given topmost priority. The operations of the subsidiaries and the associate companies have to be rationalised and made profitable. Above all, effective management control and risk management systems commensurate with the size of operations have to be installed.

All these demand very high levels of efficiency at all levels in the Company. The organisation has to be restructured, managerial capabilities at various levels have to be strengthened and adequate attention has to be given for proper training of personnel at key levels and induction of specialised skills. I would like to assure you that your Board is fully alive to the need and urgency of these changes and is committed to initiate and implement these changes as expeditiously as possible.

D. N. GHOSH

Calcutta
November 18, 1996.

Note : This does not purport to be a record of the proceedings of the Annual General Meeting.

squares estimates provide biased results. We use Tobit maximum likelihood method in estimating the following equations.

$$(E/S) = 0.065 (Z) \quad \dots(5) \\ (7.6)^*$$

log-likelihood = 36

$$(E/S) = 0.32 (IM) + 1.57 (R\&D) \quad \dots(6) \\ (2.68^*) \quad (2.65^*)$$

log-likelihood = 38

$$Z = 6.3 (IM) + 12 (R\&D) \quad \dots(7) \\ (5.1)^* \quad (2)^*$$

log-likelihood = -3.2 $N = 18$

Figures in the brackets are t values.

* Significant at 0.01 level.

The above results have a reasonably high degree of statistical significance. The signs associated with the estimated coefficients support the main propositions of the model. As it can be seen from equation (7), research and development expenditure intensity explains export intensity positively. In other words, research and development is extremely important towards achieving export success in relatively high technology manufacturing industries.

In most Indian firms, R&D expenditure had been and still is marginal. A quick reading of the data of company balance sheets (from the CII's publications) shows that a few of the Indian companies appear to be increasing R&D expenditure in the recent years, which is a healthy trend (for example, Bajaj and TELCO). Most of the R&D activity might be still adaptive (adapting imported technology) rather than innovative. Increase in this activity also leads to learning by doing and by-product technological innovations. But for these learning effects to be dominant, certain conditions have to be met: industry has to grow at a sustained rate, firms have to make deliberate efforts, domestic market has to be competitive and also complementary industries, infrastructure and institutions have to exist.

In a highly protected domestic market, oligopoly firms would tend to restrict production for realising monopoly profits which makes them X-inefficient in production. Import policies can be used to discipline domestic producers to behave competitively and increase production and invest in technological efforts (in the absence of a competitive domestic market mechanism). This point is put forward in the following section.

VI

Import Tariff Policies and Domestic Producer's Response

At present intermediate goods have been subject to lower tariffs at about 30 per cent and consumer goods are given higher

FIGURE 1

protection at 60 per cent (ad valorem). If domestic oligopoly firms producing final goods are provided with imported inputs and technology at lower tariffs, it is not logical to allow them to restrict domestic supply and charge higher prices because of higher import protection.

Textbook theory of tariffs shows that imposition of tariff on imports reduces domestic consumer surplus and increases surplus by increasing domestic production. If the domestic market is characterised by oligopoly or monopoly, reduction in tariffs till a critical level causes increase in domestic production and reduction in domestic price by reducing the market power of domestic producers. This result is applicable to consumer goods industries in India in which the market structure is oligopolistic. Increase in domestic production due to reduction in tariffs increases demand for and production of intermediate goods which, in turn, could generate positive external economies.

The above observation is illustrated by Figure 1. We illustrate this by taking a domestic monopoly producer. But the main results are applicable to oligopoly market structure in which in equilibrium there is a positive deviation between price and marginal cost (*a la* Cournot). In Figure 1, D is the domestic demand curve and MR is the corresponding marginal revenue curve. MC and AC are marginal and average cost curves. t refers to tariff rate on imports, t_1 is the initial tariff rate. With t_1 level of tariff rate on imports domestic producer would do

monopoly pricing at P and produce q_1 , at sub-optimal capacity by keeping at a level of underutilised capacity. Reduction in tariff rates to a critical level of t_2 increases domestic production from q_1 to q_2 , forcing domestic producer to behave like a competitive industry. Production at q_2 causes optimal capacity, i.e., production at the lowest point on average cost curve. Any further reduction in tariffs could eliminate the domestic producer. This is subject to the condition that cost curves remain unchanged. The interesting side of this story is that if there is a time sequence to further reduction in tariffs from t_2 , it may cause a downward shift in cost curves by making domestic producers to undertake deliberate technological and organisational efforts towards reducing costs [Patibandla 1996b]. This is illustrated as following. At time period 1, when the tariff rate is t_2 , the policy-makers announce that at a future time period 2, the tariff rate will be reduced to t_1 . The domestic producers will know that if they do not reduce costs to at least AC_2 , they will be eliminated by imports. This, in turn, can induce domestic producers to undertake systematic technological and organisational efforts towards reducing their costs of production. The shifts in cost curves is treated as a long-term effect. The reduction in costs and increase in output (to q_3) of goods could generate positive externalities by increasing demand for domestically produced intermediate goods.

An empirical example of the possibility of the above outcome is given in Jacobsson

of market failure. Under these possible outcomes, it is better for domestic government to impose an optimal tax on the production side of these sectors even if it reduces output and exports.

VIII Implications of Short-Run Capital Inflows

To recapitulate, management of competitive exchange rates is very crucial for not only exploiting static comparative advantage but also generating of dynamic advantage in selective industries. In order to generate incentives for growth through trade, exchange rates should reflect the productivity of the real economy rather than short-run movements in the financial sector. Improper exchange rate policies might generate more instability and are inimical to growth than import controls. Over-valued exchange rate can generate instability by causing trade deficits that are unsustainably large and therefore balance of payments crisis (Rodrik 1996).

Recent financial sector reforms in India that provide incentives to short-term capital inflows would do more harm than good by causing less desirable macro-economic effects like monetary expansion, inflationary pressures, exchange rate appreciation and current account deficits. Exchange rate should be adjusted only for long-run shifts in productivity rather than letting them to fluctuate because of movements in short run of capital flows. Short-term flows of capital also cause other harmful effects, as they reduce domestic interest rates and increase consumption and reduce domestic savings and cause current account deficits.⁷

IX Conclusion

In the context of increasing integration of economies and rapid technological changes, the issue of economic growth in developing economies has to incorporate several other important variables apart from capital accumulation. For catching up with developing economies, allocating capital for intentional technological efforts and increasing labour productivity is as important as capital accumulation. In the absence of technological progress, the terms of trade for developing economies will always be worse as they have to pay high prices for the products of innovating economies. As shown by endogenous growth theory, technological change requires incentives emanating from both macro- and micro-level factors. International trade is an important source of these incentives in generating both intentional and by-product (externalities) technological change by extending market size

(aggregate economic activity) and increasing competitive conditions. In order to realise the dynamic gains of trade, developing economies need to have certain minimum industrial agricultural and skill endowment which requires government investment in infrastructure, primary education and complementary institutions. Selective policy intervention on the production side may provide a cutting edge in realising the dynamic gains. Micro-level production efficiency and technological activity is very much dependent on the macro-level condition of aggregate economic activity. The role of international trade is increasing the aggregate economic activity by increasing the size of the market. But the gains through trade can be realised and magnified only when there is a vibrant domestic market base.

The past policy regime in India created a macro-environment which restricted realisation of static comparative advantage in exports. This, in turn, caused external and internal savings constraints by generating persistent current account deficits and redistribution of domestic income. Apart from this, it did not create incentives for significant technological change in the modern sectors towards generating dynamic comparative advantage in trade.

The generation of dynamic comparative advantage in modern industries through technological change requires investment in social and knowledge capital and also deliberate technological efforts on the part of firms. In the past and also in the present the investment in social and knowledge capital and infrastructure has come mostly from government and revenues for government investment are generated from a highly regressive tax structure. The notable side of the story is while the average rate of profit in the Indian corporate sector had been very high at about 30 per cent (the corresponding figure for the South Korean firms is only 4 per cent, see World Bank 1989), most firms in the corporate sector have been observed to be zero tax paying and invest very little in social and knowledge capital. The Indian corporate sector continues to be myopic with a very little investment from it in R&D and social infrastructure. The policy at the present juncture has to design and implement a carrot and stick mechanism that makes firms invest in knowledge and social capital and undertake deliberate technological efforts. Import and export policies that reflect global competitive market mechanism could be an important part of this strategy. Import policies that give greater access to technology and intermediate inputs to firms should at the same time discipline firms to make deliberate technological efforts towards improving efficiency. As shown in this paper, a sequential reduction in tariffs on imports of

final goods could function as a stick (disciplinary mechanism) to cause firms to undertake deliberate technological efforts. Furthermore, investment in R&D and technology increases wage levels of scientific skilled labour which in turn, provides incentives for technological skill acquisition by labour. For example, a dominant reason for the best-trained engineering graduates going for management education in India at present is because of the distorted incentive structure. A very low investment in R&D by the corporate sector depresses salaries of scientific manpower and high investment in marketing increases wage levels of marketing managers. This, in turn, makes an engineering graduate acquire an MBA degree in marketing instead of going for a scientific job which is basically a cumulative loss to the economy.

There are a few specific domestic industries which are skill-intensive and have strong and growing domestic demand base. This gives them a starting comparative advantage in exports. For terms of trade to be favourable, these industries should be on the technology frontier. An element of policy support in terms of providing incentives for R&D investment and technological efforts in these industries might be quite effective in providing a cutting edge to be on the technology frontier in the world market.

Notes

- 1 See Grossman and Helpman (1992) and Edwards (1993) for a review of this literature.
- 2 Syrquin and Chenery (1989) show that in the period of 1952 to 1983, in a sample of over 100 countries those with an outward orientation achieved an average output growth rate of 5.22 per cent per annum and an average growth rate in total factor productivity of 2.2 per cent per annum. Those with an inward orientation grew at an average rate of 4.28 per cent and experienced average growth in TFP of only 1.6 per cent.
- 3 For example, in the semi-conductor industry, average cost can fall by 20 to 30 per cent every time its cumulative output doubles. See Geroski (1991).
- 4 Japan, after years of imitating and absorbing foreign technology, became an important innovator in consumer and capital goods in 1980s because innovation is highly essential to retain comparative advantage in continuously changing technological frontier in the world market.
- 5 See Krishna and Sahota (1991) and also Palibandla (1996a) for a detailed explanation of this methodology.
- 6 One caveat to this observation is that the ability of the tariff policy in sequencing tariff reductions requires an understanding by the policy-makers of the time frame required for domestic producers in undertaking technological efforts to become internationally competitive.
- 7 The recent Mexican crisis of December 1995 was mainly due to exchange rate mis-

management with high levels of short-run capital inflows

Managing the Crisis

Bharateeyudu and the Ambivalence of Being 'Indian'

Tejaswini Niranjana
S V Srinivas

The films of Shankar and Maniratnam have acquired a following that goes beyond the traditional 'class' audience because of their direct and innovative engagement with the present. But to read Shankar's Bharateeyudu as an argument for liberalisation is to miss the point. What the film demonstrates unequivocally is that something is indeed wrong with our liberalised or liberalising present, that it requires re-evaluation and intervention.

IN the spectacular spaces carved out by recent south Indian commercial cinema, one is beginning to notice a certain proliferation of popular idioms dealing with political questions, a phenomenon that demands to be seen as part of attempts in different realms to 'manage' the crises of our times. One of the commonest names for the interconnected processes that are transforming our society, the name that at least for some is also a signifier for contemporary crises, is liberalisation. We would like to suggest that the term is popularly used not only to refer to the actual economic changes being wrought in India, but also to index something more diffuse, the new ways of life which are emerging and the elaborate discursive procedures that endorse and perpetuate them.

It is perhaps because of their direct and innovative engagement with the present that the films of Shankar and Maniratnam have acquired a following that goes beyond the traditional 'class' audience, coming to include many of the average moviegoers (the 'mass' audience) that throng to the films of Chiranjeevi and Rajnikant.¹ Clearly, Maniratnam's *Roja* and *Bombay*, and Shankar's *Kaadalan/Premikudu* and now *Indian/Bharateeyudu*² all attempt to articulate contemporary anxieties in the realm of the popular in ways that have successfully appealed to heterogeneous audiences. However, we would not want to argue that these two film-makers deploy the same sort of cinematic idiom or occupy the same ideological spaces, although one finds in Shankar's films a constant intertextual polemic with Maniratnam.³ As we have suggested elsewhere, the former came as it were into the techno-aesthetic space created by the Maniratnam films, but extend their signifying range in unpredictable directions.⁴ Similarly, in Shankar's *Premikudu* or *Bharateeyudu* we do not find the sort of relentless celebration of the new middle class that we have come to expect in Maniratnam's films. Instead, although the former do represent 'liberalised' spaces, they employ modes of representation that ironise, and dislodge, the iconicity of such spaces,

as in *Premikudu*, or render our responses to them ambivalent, as *Bharateeyudu* does.

Bharateeyudu (1996)⁵ has none of the consumerist euphoria and gaiety of *Premikudu* (1994), and in spite of the elaborately choreographed song sequences the dominant note is sombre, even menacing. It is possible to read the film as an apologia for liberalisation, or rather as an argument for the need to achieve that state. But to do so, we think, is to miss the point altogether. What the film demonstrates unequivocally is that something is indeed wrong with our liberalised or liberalising present, that it requires re-evaluation and intervention. While the film's analysis and the way it presents our options may be disturbing to some, we would like to underscore the importance of investigating the construction of commonsense in the film and its architecture of consent/implication. Starring Kamalahasan in two roles, father Senapati and son 'Chandu' – Chandra Bose, named after his father's commander-in-chief in the Indian National Army (INA) – the film also has three significant female figures, Amritavalli, freedom fighter and Chandu's mother, played by Sukanya, and Ishwarya and Swapna, the two women interested in Chandu, played by well-known Hindi stars Manisha Koirala and Urmila Matondkar respectively.

The film revolves around the conflict between Senapati and Chandu, although the fact that they are related is not revealed to us until after the intermission. In the second of the film's two long flashback sequences, Senapati catches Chandu trying to get his sister to forge the father's signature on a cheque. Chandu says he needs the money to bribe his way to a job, and is admonished by his father: "You should have studied harder and got better marks". Senapati also rejects Chandu's suggestion that he use the freedom fighter's quota to get the latter a seat in a medical or engineering college: "That is meant for poor freedom fighters' children". He advises his son to give up his dream of getting a city job and become a farmer too, but Chandu wants to be 'modern', and not remain in the 1940s – as he says

– like his father, who he declares belongs in a museum. So Chandu leaves home for the city, and becomes a tout in the regional transport office, until he bribes his way to the job of a brake inspector. Bribery or 'corruption' is the central theme of the film. Its pervasiveness in our present is what, according to Senapati, is destroying the nation. After he loses his only daughter because of his refusal to pay bribes to a doctor, a police officer and a village administrative officer, he decides to uproot "the weed of corruption" by deploying the skills he learned during his INA days. Not all his victims, however, are those who have personally harmed him. Indeed, the film opens with the killing of a municipal commissioner with whom Senapati has no direct link, and who mistakes the old man for a courier he was expecting with a bribe.

For a film which characterises the present as degenerate, the past perhaps necessarily stands as a point of contrast. Interestingly, it is only the pre-Independence past which provides this contrast: the first long flashback, in black and white to create the effect of verisimilitude, narrates the heroic actions of Amritavalli and Senapati during the freedom struggle. The woman is seen as engaging in two major acts of defiance – refusing to salute the British flag, and leading a group of women in burning foreign cloth.⁶ Senapati, on the other hand, is shown killing both the British officer who beats Amritavalli for not saluting the flag, and the other officer who orders the disrobing of the swadeshi women who are consequently driven to suicide. Indeed, the image of ritualistic killing dominates the nationalist flashback, as much as it does the real-time story of the film.

REWRITING NATIONALIST HISTORY

Part of the project of the film, we suggest, is to rewrite the story of nationalist struggle in such a way as to condemn the present as well as indicate what it will take to transform it. In this rewriting, the iconic figures of Gandhi and Nehru give way to Subhas Chandra Bose.⁷ Bose is in fact the only nationalist leader prominently shown in the

flashback, in documentary footage. While Gandhi is completely absent, Nehru appears only fleetingly, again in news footage, in the left-hand corner of the frame, his voice uttering, "At the stroke of the midnight hour...", immediately followed by the appearance of the Indian flag, in colour, taking the place of the British one from the black-and-white part of the flashback. Except for two brief shots of Congress activists just before the fragment of the Nehru speech, the only freedom fighters shown in the flashback are seen going off to join the INA and then later taking part in INA activities. Sacrifice and heroism thus appear as the supreme qualities of Bose's followers, who end up being marginalised in the actual transfer of power.

The film does acknowledge, however, that the freedom struggle was not simply one movement. Amritavalli asks the CBI officer Krishnaswami who comes to Senapati's house posing as a freedom fighter: "Which freedom struggle were you part of? Salt satyagraha? Non-co-operation? Extremist? Terrorist? Were you in the Bose group?..." *Bharateeyudu* selects Bose and the INA over the official Gandhian nationalism, possibly to suggest that Gandhi and Nehru, figures popularly identified with the post-Independence nation-state, are indeed a part of the problem. What they have left behind is a decaying nation which has failed to live up to the glorious sacrifices of the freedom fighters. The INA, on the other hand, is seen as representing a more uncompromising nationalism, one that offers direct solutions to present-day problems: fearless, violent struggle and instant justice. But these solutions have not been part of the dominant image of nationalism. Senapati's wife Amritavalli is the filmic character most closely identified with this sort of nationalism, since she is shown leading a group setting fire to foreign cloth, and refusing to salute the British flag. On both occasions, she has to be rescued by Senapati when she incurs the wrath of British officers; both times he kills the officer concerned in near-immediate retaliation. Although in later life Amritavalli stands by her husband when he takes up his struggle against corruption, and although she too is a freedom fighter, she is not endowed with the moral stature of Senapati, or his moral strength. Her devotion to Chandu, her 'motherly instinct', comes in the way of her commitment to her husband's cause: when her daughter is dying of burns she tries to bribe with her jewellery the doctor who has refused to treat the girl; when Chandu is being pursued by his avenging father, she tries to save him by tacitly declining to tell Senapati of his whereabouts.

Amritavalli seems to represent a 'soft' nationalism, figured in the film perhaps by the absent Gandhi.⁸ Her love for her children

overshadows her nationalism in the present. Unlike her commitment to the nationalist struggle in the past, her present response is remarkably apolitical, the family being shown as more important for her than the nation. Although this invites the chiding of her husband towards the end of the film, this is precisely what endears her to us – her attempt to be a good mother. Senapati, on the other hand, is not merely a father. His re-politicisation into heroic, violent and terroristic action is counterpointed by Amritavalli's gradual depoliticisation into motherhood. Her image, we argue, represents a gendering as female both aspects of the dominant strand of the nationalist struggle – Gandhian non-violence, as well as the maternalistic welfare state Nehruvian socialism which has failed because it is not tough enough on its citizens. Towards the end of the film, when Senapati is arrested for murder and is being taken away by the police, another old man from the crowd calls out: "Why are you arresting this old man? He's been doing what the government couldn't do in 50 years".

This emphasis on the moment of transfer of power is invoked in another image which is also that of Senapati's imprisonment, when he was a young man. On the eve of independence, Senapati is captured during an INA battle with British troops and tortured in jail, being released only after the country has gained independence. The year 1947 is indicated as the crucial cut-off point, the seemingly glorious moment of our history which is really the beginning of our downfall; in this narrative, it is fitting that Nehru is presented as presiding over the inaugural moment of nationalism gone wrong, whose future comes to fruition in our corrupt post-colonial present.

EVERYDAY CORRUPTION

It is as if all the misery of the present can be condensed into this one image of corruption. Those who are corrupt, according to the film, are government officials, employees of the state. No politicians are shown as implicated in this. 'Corruption' is produced in *Bharateeyudu* as self-explanatory, self-evident, as the truth about our predicament. Corruption, the film seems to say, is something one finds in everyday interactions, and not necessarily in high places: Senapati's targets are middle or low-level government officials – the corporation commissioner; the village administrative officer; the police sub-inspector; the doctor (later a dean in Nizam's hospital); the treasury official; the traffic policeman. Corruption is presented as a problem for all sections, but more so for the poor. Senapati asks the VAO who demands a bribe: "I can pay because I have the money, but what about the poor?"

Poverty figures briefly but prominently, symbolised by the old woman whose cobbler husband is killed in a police firing even as he sews Senapati's belt. But the film is not about poverty or the problems of the poor. The state will take care of those among the poor who have been subjected to unjust or undue hardship, if only the servants of the state would do their duty without expecting 'extra' for it. The primary cause of the poor's suffering, then, turns out to be the corruption among government employees, from the attender to the treasury officer.

The way the film piles image upon image of petty acts of bribery appears to mimic, and reinforce, the anecdotal mode in which middle-class grievances are strung together and presented as social analysis. This is perhaps one of the reasons why the film depicts low-level corruption: it helps produce the frisson of recognition, it is seen to touch everybody's life; everyone we know can come up with illustrations to endorse the film's representations. The personal narratives of corruption that the film invokes are reminiscent of the manner in which such anecdotes were mobilised during the anti-Mandal agitation to decry the 'evils' of reservations. Mandal is indeed a tacit reference point in the film, as we shall elaborate later. How the film secures our consent for its analysis is directly related to how its audience is enabled to disavow corruption, turn it into a phenomenon that it is part of but shown as distanced from at the same time. This disavowal is accomplished through complex structures of identification.

There are the victim figures we sympathise with, even the ones who are compelled to give bribes, like the cobbler's wife, or Chandu in the first part of the film. The taking of bribes is seen as far more serious, earning from Senapati the penalty of death. Sometimes, as in the case of the corporation commissioner killed by Senapati in the opening scenes of the film, the giver of the bribe is not even shown. Although after Senapati's appearance on TV, some officials attempt to make reparation, no bribe-giver is ever shown as repentant, suggesting that the giving is under duress and that the giver is not part of the same market economy as his or her exploiters.⁹ The character of Chandu is in some ways an exception; initially the audience is on his side, when he is shown as a victim of the system, forced to give bribes to survive. He begins to slip in our estimation only when the link between consumerism and corruption is made evident.

MORALITY AS POLITICS

Our initial identification with Chandu, presented as a genial and hapless young man, desiring the life of the modern that his

father's austerity⁷ denies him. His 'corruption' is shown for the most part not as a way of life held up for admiration but as street-smartness, as a way of negotiating the modern. Thirdly, there is Senapati himself, the harmless-looking old man with a militant past, roused into action by the corruption of our times. Senapati offers a moral analysis of our predicament, not a political one. However, *Bharateeyudu* depicts the past almost entirely in conventional political terms, whereas the present is shown as both apolitical and immoral. Senapati, on the other hand, is the supremely moral subject, and therefore in the film's terms the supremely political subject too. When he appears on cable TV to harangue the nation and execute the corrupt doctor, he is literally clothed as a political subject – he wears his INA uniform with a round pin on the chest carrying the colours of the Indian flag. The film seems to suggest that Senapati's everyday dhoti and kurta is actually a disguise, just like the western-style suit which he wears in the last sequence. His most natural dress is the INA uniform (the dress that shows us who he 'really' is), which he wears when he offers his diagnosis of what is wrong with the nation. The clothing, then, enables the moral diagnosis to be presented as a political one, just as Senapati's actions – arising out of a moral indignation – are politicised by the film, seen as making for change. The production of Senapati as authentic political subject thus validates his analysis of corruption as a political statement, not a moral one, so that in the film the ethical appears as the political. The persuasive force of this analysis stems from corruption's availability as a commonsense critique of the present, a critique that appears to span various ideological differences. This consensus is related in turn to a wide acceptance of what constitutes the liberal state and what kind of regulation of civic life it should provide. The nationalist citizen, the citizen endowed with rights, is presented in this film as a militant citizen-subject, in short as a vigilant citizen attempting single-handedly to enforce good governance. The IPS officer Krishnaswami, played by Nedumudi Venu, who bonds with Senapati as he pursues him, says he would himself ask for Senapati's autograph if he did not have to do his duty by arresting him for murder. Our sympathy is continually elicited for the good policeman – if he had been of an older generation, he could indeed have been Senapati himself.¹⁰

The portrayal of all the organs of the state, repressive as well as welfare apparatuses, as corrupt, the elimination of corrupt officials and Senapati's broadcast to the nation on cable TV blaming corruption for the country's backwardness, sets the stage for the final confrontation between Senapati

and his son. The immediate context is Chandu's issuing, in return for a bribe, a false fitness certificate to a decrepit bus which leads to the death of 40 school children. Chandu tries to bribe his way out, pleading with the police officer investigating the case and the government doctor involved in the autopsies that they ought to help each other, since they are all government servants. Caught redhanded by his father trying to inject alcohol into the dead bus driver's body so as to falsify the post-mortem report, Chandu appeals to his father's love. Senapati describes this as an emotional bribe, and tries to kill him, with the same knife from his INA belt he has used on the other government officials. Chandu escapes, but is ultimately tracked down by the 'meticulous old terrorist' and killed after a breathtaking chase.

SPLIT HERO

When did we last see a 75-year-old hero? How are our sympathies finally secured for Senapati? As audience, our interest is made to swing away from Chandu to his father. We suggest here some of the ways in which this is managed. The narrative crucially hinges on the confrontation between father and son, and what the two characters represent. The two men stand not for 'tradition' and 'modernity' but for two related yet different perspectives on the present. Significantly, they are presented as rival heroic figures up to a point. They are in fact introduced as individuals unrelated to each other, although both are displayed to the audience as 'heroic', albeit in different ways. Generally, in Indian popular cinema dual roles complement each other and the tensions generated between the two are usually resolved by the film's ending, which shows the two joining hands to defeat the common enemy. *Bharateeyudu* plays with the audience's expectations, allowing us to assume until almost the very end that father and son will be reconciled, that Chandu will mend his ways. The younger 'hero' is presented to us as a 'common man', a victim of the corrupt system who has nonetheless gained a place for himself within it. Chandu gains our admiration and sympathy for his ability to succeed in a system where all the odds are against him. He is shown to us literally on the streets, struggling to survive as a tout. His predicament is partly due to his father's refusal to help him (ignoring a cardinal rule of paternal responsibility). Chandu also demeans himself, doing menial jobs because of his love for Ishwarya. He wants to bribe his way into a brake inspector's job because he does not want to marry the girl while he is only a 'broker'. Interestingly, the choice for him is not between honesty and corruption but between being a broker

for the corrupt machinery of the government and becoming a part of it. We are not induced to condemn him, initially. He is presented as comic but not foolish; we laugh at his troubles which actually endear him to us. Like the conventional hero, Chandu is macho, to the extent that there is a 'surplus heroine' trying hard to engage his attention and who is in a position to exploit him sexually. This other heroine's main function is to enhance the attractiveness of the younger hero.

The film presents us with two narratives that run parallel to each other, each centred around one of the heroes. The editing ensures that both share reel-time almost equally, with rapidly alternating sequences that feature each of them in turn. Chandu's narrative is about the naturalness of corruption, of its regretted but inevitable place in our daily life; here corruption is dramatised for us in a series of comic episodes involving not only Chandu but also the minor characters Subbiah and Pandireswara Rao. "What is government?" Chandu's sidekick Subbiah asks rhetorically of a young man he is trying to induce to part with a bribe for a driving licence, "Putting amounts in envelopes is government". Senapati's narrative, on the other hand, depicts corruption as the supreme evil, diagnosing it as the 'cancer' eating away our body politic. Described thus, it can only be fought by the direst of means. The forcefulness of the film lies in its ability to allow its audience to appreciate and inhabit both narratives simultaneously, until certain events jolt it into accepting one over the other.

Even as Chandu romances, dances and fights his way into our hearts, Senapati's narrative grows progressively more central to the film. The old man is shown performing crucial tasks which are generally set aside for a younger hero. Each one of Senapati's killings is graphically depicted, but there is a striking economy of violence in his actions. Unlike the lengthy, conventional fight scene between Chandu and the man who steals Ishwarya's animals, Senapati's murders are quickly and efficiently performed – deft use of his fingers and a couple of thrusts with his knife is all a killing takes. Like the traditional hero, Senapati is shown outwitting the police, who, incidentally, are depicted as extremely efficient and non-violent in their methods. He shares the audience's knowledge of events which he does not witness. For instance, he knows intuitively where Chandu has hidden his mother; changes the colour of his van when we learn that the police are looking for him; knows that the CBI officials have a videotape of his final escape.

The process of constructing Senapati as the 'Indian' continues throughout the film. The long flashbacks contribute to locating him in the nationalist movement, the

archetypal source of the heroism of the modern Indian, as well as creating his credentials as the wronged, revenge-seeking hero. Chandu, on the other hand, is increasingly seen as marked by an emptiness: not only does he have no claim on the national movement, he also crosses over to the other side, returning to the village briefly only to blame his father's uncompromising stand on corruption for his sister's death.

The televised murder of the doctor who refused to extend medical assistance to Senapati's daughter is followed by the old man's incorporation into the public iconography of heroism. An enormous hoarding of his figure appears at a busy intersection, and we are shown instances of people using intimidation of various kinds against corrupt government servants.¹¹ Simultaneously, Chandu's hero-value is being eroded for us as we watch him, after the bus accident for which he is responsible, take recourse to bribery in order to falsify the police and medical reports. It is at this point that we finally abandon Chandu to his fate. His realisation that his father will not spare his life coincides with our realisation, which is as shocked as Chandu's is, that the young man is not a true hero after all. Not only will he die, but his death will not be tragic. He hits his father with a stool, enabling the police to arrest him, and shouts that Senapati be hanged. Till the end of the film, Senapati and Chandu retain their mutually opposed beliefs. What changes is the audience's estimate of each. While Chandu is willing to sacrifice his father to save himself, Senapati is prepared to sacrifice his son in order to save the nation. In this way, the complementary dual hero of popular cinema becomes in *Bharateeyudu* the split hero.

Both characters make a claim for the status of hero, since both share qualities generally identifiable with the hero, and contrary to our expectations it is the older man who wins out in the end. Part of the film's appeal lies precisely in this unusual movement of the narrative with regard to the father-son pair. The enormous technical and financial investment in Senapati's make-up (or Kamalahasan's disguise) has found its place on the film's posters as one of its highlights, and has indeed been received as such by cross-sections of the audience. Because of the fact that the undisguised hero also plays a major role in the film, the Senapati's make-up constantly draws attention to itself, eliciting audience questions such as "who is he? what does he really look like?" Senapati is admired not only because of what he stands for, but also because Kamalahasan as the old man puts on show his ability to play roles with a 'difference'. The film, then, demonstrates how it produces as 'real' an embodied person who does not exist outside

the cinematic frame, unlike the star-body of the young Kamalahasan. For this production of the real, and the real as the truly Indian, the film sometimes has to take recourse to startling devices, such as the little episode of the traffic constable. In this episode, two characters unusual for Indian popular cinema are used to counterpoint and thereby affirm Senapati's identity. Two young African men (probably Nigerian, from their accent) who have been stopped on their two-wheeler by the bribe-seeking cop, are thrilled when Senapati knocks him out. They call out to Senapati, in English: "Hey, old maan!" "By the way, who are you?" "Me?" he says, with a self-deprecating smile, "I am an Indian".

HETEROGENEOUS ADDRESS

The scene with the traffic policeman is also important for its underscoring of the anti-Mandal theme in the film, and we shall suggest shortly how it does that. It is worth stressing at this point that the film is read by us with the help of interpretive structures which have been formed through our understanding of present-day politics, in India at large and in Andhra Pradesh in particular. As has been argued elsewhere, incidentally in relation to Shankar's another film, one cannot measure the validity of a reading by its 'faithfulness' to some self-contained text of the film, but rather by whether it is able to throw light on aspects of contemporary politics.¹² One often hears today in the context of film interpretation an old accusation that used to have some currency in literary critical circles – the charge of 'over-reading', presumably referring to the valorisation of elements in a film that appear incidental to the narrative. It is likely that the same charge will be levelled against our reading of the anti-Mandal elements in *Bharateeyudu*. We argue that these elements form a crucial subtext in the film, although they cannot be read in a unilinear fashion, that is, *Bharateeyudu* cannot be described in any simple sense as anti-Mandal. The presence of what we call the anti-Mandal elements demonstrates that any film claiming to deal with the contemporary period cannot but allude to Mandal, however obscure or tangential such allusions may be. They form a subtle undertow to the main narrative, which compels us to read them in a particular way so as to endorse the logic of that narrative, whereas the same set of allusions in a different plotting might yield, as in Shankar's *Kaadalan*, an altogether different reading. This is due, we feel, to the heterogeneous structure of address of popular cinema. The unity of meaning is not necessarily conferred by an individual *auteur* (director/scriptwriter), but rather by the response of audiences formed by a variety of political

questions that carry different valencies for each segment of spectators.

Bharateeyudu's narrative of everyday corruption, we argue, is both necessarily and inconsistently related to the anti-Mandal agitation. The event and its fallout (the analyses of the anguish of upper caste youth, the foregrounding of the reservations issue, the invocation of 'merit') is now so much part of the history of the present that anti-Mandal allusions are routinely available in the structuring of our commonsense to be put to a variety of uses. Take the traffic policeman scene for example. Senapati wanders through, his attention drawn by the policeman's stopping of a young office-going couple on a motorbike. The driver of the bike is asking the policeman why he cannot be allowed to go, since all his papers are in order. The man, after asking for a bribe of Rs 150, is shouting at the unwilling motorcyclist. Senapati stands next to the young office-goer, listening. He asks the young man to take off his shoe, picks it up, puts it on the seat of the traffic policeman's motorcycle, and tells the policeman he must clean the office-goer's shoe first and then take the money. In this fleeting gesture which in many ways is more violent than the blow with which Senapati later knocks out the policeman, an entire caste hierarchy is etched – one which inscribes the victimised office-goer as upper-caste/class and the bribe-seeking policeman as lower caste/class.¹³ The meritorious, the scene suggests, should be exempt at least from polishing their own shoes. In our post-Mandal present, this symbolism requires no further interpretation. What the image of the shoe does economically is to yoke together the corrupt and non-meritorious with the inefficient 'quota' officer, the larger imagery in which both are held containing the idea that both kinds of public servant are merely self-seeking, and therefore do not have the interests of the nation at heart.¹⁴

Another sequence thematises a popular anti-Mandal image – that of the good dalit in his place, the deserving lower-caste poor person, contrasted implicitly with the corrupt traffic policeman. A cobbler by the roadside is hard at work, sewing Senapati's belt which doubles as a knife-sheath. A demonstration is taking place nearby, with young men holding aloft placards which read, in English, "Revolution", "Stop Corruption!" etc. The police open fire on the crowd; a young protestor is shot through his leg, and the bullet passes right through and hits the cobbler, killing him instantly. When the government announces compensation of Rs 10,000 to the families of those killed in the incident, the cobbler's wife puts in an application. We follow her travails as one treasury official after another demands a bribe from her – this is not depicted in real

time but forms part of the woman's guided tour of the treasury provided to another poor woman who has come there hoping for a similar compensation. After using up her savings for the smaller bribes, the cobbler's wife is finally shown helpless before the officer who demands a cut for passing on her cheque. When she starts abusing him, he has her evicted from his office. In the crowd outside is Senapati, who, in the sequence that follows, seeks out and kills the treasury officer. In the wake of Senapati's televised killing of the doctor, an official from the treasury brings to the cobbler's wife the money the government owes her. As he leaves, she says, referring to Senapati: "Who is that man? If he stands for election, my vote is for him". In Senapati, we find the authoritarian (male) figure who proclaims his intention to root out corruption – shades of Seshan – and is solicited by the public to seek electoral office. "Fear is my weapon", says Senapati in voiceover when he decides to avenge his daughter's death and crusade against corruption, "Fear of punishment, fear of death". Fear and the violence which produces it are presented in *Bharateeyudu* as the sole guarantors of both stability and civic responsibility.

Yet another deployment of a distinctly anti-Mandal image is that of the middle class, upper caste person doing menial tasks. As part of his effort to get the brake inspector job, Chandu does various small chores in Swapna's house – running errands, threading her petticoat string – which, although presented as comic, somehow unman him, calling forth the audience's sympathy. These menial tasks are also seen as a direct outcome of corruption. Once again we see the convergence of the anti-Mandal and the corruption narrative: it is implied that because Chandu is an upper caste person he doesn't qualify for reservations, and that this is an important reason he has to resort to corrupt means to obtain a government job.

The relationship Swapna, daughter of Chandu's patron, desires with Chandu never has a chance, in spite of her beauty and intelligence. Surrounded by the consumer goods (cameras, CD decks, luxury cars) her government servant father has illegitimately managed to acquire, Swapna represents the link between greed and consumerism that the film portrays as the main cause of corruption. Chandu, on the other hand, desires to marry Ishwarya, who is a Blue Cross member obsessed with animals, marked by clothing and concerns as upper caste-class. While her obsession is gently ridiculed in the film, it functions as an index of her caste-class superiority (and therefore of Chandu's desire for her), most vividly in the sequence involving the ox-cart driver Mallesham, who she berates for ill-treating his animal. Although Ishwarya embodies

Chandu's aspirations to be successful and modern, she is not shown surrounded by consumer durables. Presented to us as innocent and somehow pure, she stands apart from the world of the everyday and above the corrupt system that Swapna and Chandu both inhabit. In a strategy of displacement, however, a fantasy song-sequence with Chandu and Ishwarya set in Australia likens the woman to a cellular phone, declares her voice to be "as though...digitally cut", and wonders if Brahma the creator used a computer to produce her. The depiction of Chandu as seeking a government job by any means because of his ambition to marry Ishwarya and not necessarily because of his desire for consumer goods, helps the audience see him as vulnerable and likeable for the better part of the film. Ishwarya's class position does not, however, prevent Senapati from pulling her up for showing more concern for animals than for the forty schoolchildren Chandu has unwittingly killed, an indication that within the parameters of the film, the rich can be subjected to criticism. But her inability to think beyond her love for Chandu and her inadequate concern for the nation, as we have seen with Amritavalli the mother, is pardonable, since it is a womanly trait.

THE EASTERN-MODERN

We have tried to show how the narrative structure of *Bharateeyudu* produces an ambivalence towards the dominant model of modernity/nationhood that India has emulated in the post-Independence years. This ambivalence is accompanied, we feel, by a gesturing towards another model, that of the 'Asian tigers', a model we would like to name the 'eastern-modern'. This gesturing is endorsed by the rewriting of nationalist history that we have already described. In the film, the INA, with its 'eastern' connections, takes centre-stage in the story of the freedom struggle; the first nationalist leader shown in flashback is Subhas Chandra Bose, and it is the INA's confrontation with British troops near Kohima which in the cinematic narrative directly precedes – is therefore imaged as leading to – the acquiring of Independence.¹⁵ Independence, however, becomes in the film a promise betrayed, resulting in the degeneration of the present in which both Nehruvian welfarism and western modernity are implicated. While the first has led to the proliferation of inefficient and corrupt government servants, the second has been responsible for the creation of consumerist desire on which corruption is seen to feed (Chandu promises as bribe a colour TV set to the police inspector and a 'laser disc' to the government doctor). The "Indian's" dissatisfaction with this state of affairs does not curiously enough manifest itself in an argument for doing away with

the welfarist state or in an attempt to propagate a Gandhian model of living. Indeed, *Bharateeyudu* seems to clamour, as the 'old' Indian middle classes have been doing, and as most popular cinema does, for "clean governance", for an "efficient" state. In doing so, the film articulates the unease with liberalisation shared by various groups in India, despite the general consensus within the mainstream political parties that globalisation and liberalisation are inevitable. While the film does not seem to refuse this view, it does raise significant questions related to the kind of model of the 'modern' we need to adopt. Unlike the 'tiny island states' around us, we have failed to progress, says Senapati in his TV address. It is corruption that is responsible for our "backwardness", according to him, and it is the state which harbours corruption, which is why his targets are all government officials. The rest of the east, however, is quite different: their states are so well-regulated as to be the least corrupt in the world. Not only that, the Asian tigers (and Senapati himself) also represent in the film a coming together of 'tradition' and 'modernity' with no visible conflict. The method used by Senapati to destroy his enemies is 'marmakala' – a usable 'tradition' represented in the idiom of popular cinema as extremely contemporary. Senapati's movements, and the accompanying soundtrack, are reminiscent of kung fu films in their stylisation. One of the reasons why the audience comes to reject the younger hero Chandu is that he has got it all wrong; for him the past/tradition is holding people back, whereas in the figure of Senapati tradition is shown as that which is indeed capable of propelling you into the future.

A strategy employed by the film to re-figure the tradition-modernity relationship is to dis-organise, as Shankar's earlier film *Kaadalan* does, the binary rural-urban created in different ways by both commercial and parallel cinema in post-Independence India. Senapati the old farmer is the person in the film most at ease with modern gadgets – he is shown driving a variety of vehicles; using a spray-can to paint the old van he buys; speaking over a cordless phone. As part of the suturing which enables us to accept Senapati over Chandu, no distance is revealed between him and the products of new technology. Senapati inhabits the space of these objects in such a way that they are naturalised, seen in use, not fetishised unlike in the Melbourne song sequence which features Chandu. The old man is completely in command at the private TV station as well, operating the machinery single-handedly without any fumbling. After the telecast in which Senapati is wearing his INA uniform, as part of the public celebration of his actions, we have a brief shot of a row

of young men on the street dressed in INA outfits, except that they are blue, mauve, and pista green. We hear in voiceover a girl exclaiming that all these young fellows look like 'Bose'. Given what we have called its heterogeneous structure of address, it is not incongruous that the film can make Bose part of a fashion statement, reinforcing through this fashion-as-politics the idea that young people today can be 'modern' and still be nationalist.

In this attempt to become modern, but not on the terms of the 'west', east Asia plays a prominent role in *Bharateeyudu*, being a locale in which we are constantly told, as in the popular narratives about Japan, 'tradition' and 'modernity' are combined in suitable proportions. The INA headquarters, where Senapati's valour is recognised by Subhas Chandra Bose, who pins a medal on him, was in east Asia, as the film reminds us; the 'east' is also the 'origin' of the march on the British forces in India which leads in the filmic narrative to the final confrontation with the colonisers; in the cable TV sequence, we hear the dialogue between the doctor and Senapati about the reasons for the prosperity of the small islands of Asta, and later the police are told, as an explanation for why the telecast could not be stopped, that the video-cassette was sent to Singapore and telecast from the Philippines;¹⁶ The final scene of the film shows us a phone booth against a background of skyscrapers. Senapati, who has escaped from the airport conflagration caused by his pursuit of his son, and is now dressed in a western-style suit, is speaking to the CBI officer in India. "So you're alive", says Krishnaswami, "Where are you?" Visual markers indicate that it is from east Asia that Senapati is keeping watch over India, although he does not reveal this to his interlocutor.¹⁷ "I will return whenever a wrong has been done", he says, "There is no death for the Indian".

Notes

[We would like to thank Rekha Pappu, K Murali, R Srivatsan and Vivek Dhareashwar for their provocative comments on earlier drafts of this paper.]

- 1 This is a distinction made by popular film magazines and regular moviegoers. A 'class' film is distinguished from a 'mass' film by its supposed seriousness and higher aesthetic quality.
- 2 Earlier films by these directors were usually made in Tamil and dubbed into Telugu. Now they are being dubbed simultaneously into Telugu and Hindi, with some sequences re-shot to provide the local linguistic context. These dubbed films circulate in different political-cultural spaces from the 'original' Tamil versions. Our response to *Bharateeyudu* is to the Telugu version, which has been playing to full houses for over 60 days at the

time of writing in 50 theatres all over the state.

- 3 This polemic can be seen operating at different levels of the filmic text. There is, for example, the comic scene at the racetrack when Chandu's sidekick Subbiah is trying to provoke his *bete-noir* Pandireswara Rao. The latter is in the stands with his young son, who is as dark and plump as his father is. When Subbiah asks for the name of the boy, the father says, beaming: 'Arvind Swamy'. The reference is to Maniratnam's hero of the same name, the star of *Raja* and *Bombay*.
- 4 See Vivek Dhareashwar and Tejaswini Niranjana, 'Kaudalan and the Politics of Resignification: Fashion, Violence and the Body', *Journal of Arts and Ideas*, No 29, January 1996, p 15.
- 5 Direction, screenplay and story by Shankar. The Tamil version is called *Indian* and the Hindi version *Hindusthani*.
- 6 In order to juxtapose the different strands of the national movement, several campaigns from different decades are compressed together in the filmic narrative.
- 7 In our reading of the place of Bose in the history of nationalism, one of the books we found most useful is Bidyut Chakrabarty's *Subhas Chandra Bose and Middle-Class Radicalism: A Study in Indian Nationalism 1928-1940*, OUP, Delhi, 1990
- 8 A little joke is tucked into the filmic narrative as if to mark the absence of the real Gandhi. The only time we see a reference to this name is when we see a nameplate of Swapna's father. The name of this corrupt government official, a transport supervisor, is M Gandhi Krishna.
- 9 The film, while it seems to celebrate consumerism in the first two song sequence, for example, simultaneously appears to suggest that the desire for consumer goods is closely linked to corruption.
- 10 When Krishnaswami brings home-cooked food for the old man who is in custody, Senapati asks whether he has "changed his 'route'". "No", replies the policeman, "My route is the same as yours."
- 11 The presentation of a near-totalitarian justice might indeed be read as 'fascist', as the star Kainalahasani himself does in accounting for the appeal of the film (Interview with Khalid Mohamed, *Filmfare*, July 1996), but we feel that this description forecloses any attempt

to analyse the ambivalent politics of the film. Most heroic figures in popular cinema can be read with equal certitude as fascist. If we accept this kind of reading, we run the risk of fitting the 'mass appeal' of popular films and their complicated structuring of consent into a simplistic analytical frame.

- 12 See 'Kaudalan and the Politics of Resignification', p 19 and p 26 (endnote 16).
- 13 The film does mobilise the signifier of complexion in the representation of caste-class difference. Even without such a deployment, our argument is that the gesture of the shoe produces an entire structure of allusions which performs the function we have described, that of etching caste-class identity for the viewer.
- 14 The Senapati cutout that is put up at an intersection after his entry into the public imagination has a legend underneath, which reads in Telugu: "Students who have got seats without giving donations" Also, in the second flashback, Ambedkar's photo figures prominently on the wall, his image looming large between the faces of Senapati and the sub-inspector who is asking for a bribe. This apparent discrediting by association of Ambedkar could also be seen as part of the film's general discrediting of nationalist leaders other than Subhas Chandra Bose
- 15 A half-page newspaper advertisement appeared in *Andhra Jyothi* (June 30, 1996) stating that the film *Bharateeyudu* is dedicated to the freedom fighter Netaji Subhas Chandra Bose on the occasion of his 100th birthday. The ad has a tricolour map of India on which is partly superimposed a black-and-white sketch of Bose and a coloured painting of the character Senapati in INA uniform. In the lower right-hand corner are photographs of the producer A M Ratnam, the director Shankar, and the music-composer A R Rahman.
- 16 Although we are shown the televised killing as though it is taking place in real time, the audience realises later that there is a time-gap between Senapati's production of the event and its telecast.
- 17 This choice of the eastern-modern might also imply a preference for a strong, repressive state which can afford to ignore the pressures of human rights groups and other such 'western' inventions.

For the Attention of Authors

The compulsion to limit the size of issues on account of steeply rising newsprint and other costs and a sizeable backlog of material awaiting publication lead us to request that papers submitted for publication be not over 10,000 words, including tables and notes and references.

It is helpful if contributions in word-processed format are accompanied by floppy disc copies, in Wordstar preferably. The latter will be returned after use.

Economic Reforms, Health and Pharmaceuticals

Conferring Legitimacy to the Market

Amit Sen Gupta

The 'safety net' formula being propounded by the World Bank can be seen as a partial strategic retreat of the earlier Bank prescriptions of near total withdrawal of the state from all social and infrastructure sectors. The impact of these reforms in the health and pharmaceuticals sectors has therefore not been uniform and needs to be studied with care.

I Reforms in Health Care

STRUCTURAL adjustment policies were introduced in this country in 1991 by the previous Congress government. These policies sought to—by way of fiscal austerity measures—cut government spending and subsidies in social sectors, reduce direct taxes, increase administered prices, liberalise trade by reducing tariff rates and providing other incentives for foreign investments, privatise public enterprises, deregulate the labour market, etc. The policies were designed to clear the path for withdrawal of the state from the social and welfare sectors like health, education, public distribution system, etc. These policies use 'free market' ideology as the guiding principle, and are designed to place the 'market' in a central position of dominance, where it would act as the principal, if not sole, arbitrator of all processes. At a global level such a position is extended to encompass the concept of 'free trade'—a concept that has been captured in its full essence by the GATT treaty of 1994.
